B O O K III.
O F E U R O P E in general.

THIS part of the globe was called Europa by the Romans, as it is still by the Spaniards and Italians, and Europe by the English and French; but the Turks give it the name of Alfrank, or Rumeli, the Georgians of Asia call it Frankoba, and the rest of the people of Asia give it the name of Frankistan. It is bounded on the north by the Frozen sea; on the east by Asia, from which it is parted by the Archipelago, the Euxine or Black sea, and the Palus Mæotis, and thence by a line drawn from the river Tanais, or Don, almost to the river Oby; on the south by the Mediterranean sea, which divides it from Africa; and on the west by the Atlantic Ocean.

This grand division of the earth is situated between the tenth degree west, and the sixty-fifth degree east longitude from London, and between the thirty-sixth and seventy-second degrees of north latitude, extending three thousand miles in length, and two thousand five hundred in breadth.

Though Europe is the least of the four parts into which the earth is divided, it enjoys many advantages. No part of it is in the torrid zone; and though some countries to the north partake of the coldest climate, yet the greatest part of this division enjoys a mild air, and great fertility of soil. It has a multitude of navigable rivers, and abounds in corn, cattle, wine, and oil, at once possessing all the necessaries and most of the luxuries of human life.

Europe has for many ages been exceeding populous, and her inhabitants are distinguished by their valour, wisdom, and virtue; the excellence of their governments, the equity of their laws, the freedom of the subjects, and for the purity and sanctity of their religion.

The Europeans have been the most celebrated for learning and arts. All the scholastic sciences are here brought to much greater perfection than ever they were carried by the Asiatics and Africans; and the invention and improvement of numberless useful and ingenious arts, particularly that of navigation, on which the intercourse with foreign nations, and all the advantages of commerce depends, is entirely owing to the genius and industry of the inhabitants of this part of the earth.

The Christian religion is established throughout every part of Europe, except Turkey; but, from the various capacities of the human mind, and the different lights in which speculative opinions are apt to appear when viewed by persons of different education and passions, that religion is divided into a number of different sects. In Russia, some parts of Poland, in Walachia, Moldavia,

Podolia, Volhinia, and Greece, the doctrine of the eastern or Greek church is established. In Italy, part of Switzerland, Spain, Portugal, France, Poland, part of Germany, and the Netherlands, the inhabitants still follow the doctrines of the church of Rome; while Great Britain, Ireland, Denmark, Sweden, Norway, great part of Germany, the United Provinces, and part of Switzerland, have embraced the doctrines of the Reformation, and profess the Protestant religion.

The languages of Europe are derived from the six following: the Greek, Latin, Teutonic, or Old German, the Celtic, Slavonic, and Gothic. From the different dialects and intermixtures of these, are formed the languages of the most considerable parts of Europe, except that of Turkey and Tartary.

The principal sovereignties, beginning at the east, are the empires of Turkey, Russia, and Germany.

The kingdoms of Poland, Hungary, Bohemia, Prussia, Sweden, Denmark, Naples and Sicily, Sardinia, France, Spain, Portugal, Great Britain and Ireland.

The popedom of Rome.

The republics of Venice, Genoa, Lucca, the Grisons, St. Marino, Switzerland, Geneva, Ragusa, and the United Provinces.

Besides these there are the electorates of Germany, and near three hundred other sovereignties in Germany, Italy, &c. whose professors are either spiritual, as archbishops and bishops, or temporal, as princes, landgraves, dukes, marquises, counts, &c.

Besides these there are the Cham of European Tartary, the hospodars of Walachia, Moldavia, &c.

The principal islands, beginning at the east, are Candia, and those of the Archipelago.

Those in the Adriatic and Ionian sea, viz. Leucadia, which belongs to the Turks and Lefina, Corfu, Cephalonia, and Zant, which are subject to Venice.

In the Mediterranean sea are Sicily, subject to the king of Naples; Sardinia, subject to the king of Sardinia; Corsica, subject to Genoa; Minorca, to Great Britain; Majorca and Ivica, to Spain.

The islands in the Baltic sea are Usedom and Wollin, subject to Prussia; Osel and Dagho, subject to Russia; Gothland, Aland, and Rugen, which belong to Sweden; and Zealand, Funen, Alsen, Longland, Laland, Falster, Mona, and Bornholm, subject to Denmark.

In the North sea is Iceland, subject to Denmark.

And farther to the south are Great Britain and Ireland, with the adjacent islands, subject to his Britannic majesty.

C H A P.

C H A P. I.

OF TURKEY in EUROPE.

S E C T. I.

Its Boundaries, Climate, Divisions, Seas, Straights, and Rivers.

TURKEY in Europe, a part of the antient Christian empire of the East, is at present bounded on the north by Croatia, Sclavonia, and Transylvania; on the east by Poland, Russia, and Asia; on the south by the Mediterranean sea; and on the west by the Adriatic and Dalmatia. The extent is not to be ascertained with any precision.

The air of Turkey in Europe is in itself healthy, but the pestilence is often brought there from Egypt and the neighbouring countries, and has several times swept away above one-fifth of the inhabitants of Constantinople; yet from the prevalence of custom, and of the Turkish doctrine of fatality, they give themselves no great concern about it. The provinces are universally fruitful, though with some difference; whence agriculture and grazing turn to great profit there, prodigious quantities of all kinds of excellent grain and fruit being annually exported. But of this we shall give a particular account in the separate description of each province, only it may be necessary to add here, that all the necessaries of life are equally good and cheap in Turkey.

It contains the following provinces: to the south are the Morea, or Peloponnesus, Achaia, Thessaly, Epirus, Albania, and Macedonia; and towards the north, Romania, Bulgaria, Bessarabia, part of Podolia, Servia, part of Hungary, part of Croatia, Bosnia, and part of Dalmatia.

Its seas are the Euxine or Black sea, the Palus Mæotis, the sea of Marmora, the Archipelago, the Ionian sea, and the Levant.

Its straits are those of the Hellespont and the Bosphorus.

The chief rivers of Turkey in Europe are the Save, the Danube, the Niefter, the Nieper, the Don, and the Theis.

S E C T. II.

Of the Inhabitants of Turkey in Europe, with a more particular Account of the European Turks and Greeks.

WE have already given a very particular account of the persons, dress, manners, and customs of the Turks, in treating of Turkey in Asia, see vol. I. from page 265 to 273; and as the Turks are every where the same, we shall here be very concise, and shall only add some particulars which were there slightly touched upon, and a short summary of some of the most considerable circumstances relating to that people.

The number of its inhabitants has not the least proportion to the extent and fertility of the country, which may be chiefly attributed to pestilence, polygamy, war, and the avarice of the governors.

The inhabitants consist of various nations, as Turks, Greeks, Armenians, Servians, Bosnians, Bulgarians, Walachians, and Tartars; with a considerable number of Jews, especially in Constantinople and Sclavonia.

The Turks are stigmatized by the Christians as a slothful and inhuman people; but they are far from being so wicked and dreadful a set of creatures as popish writers have endeavoured to represent them. Turkey is not without men of parts, probity, and honour; and has many benevolent, liberal, temperate, conversible, and ingenious people. In short, there is here, as in all other countries, a mixture of good and bad. Dricesch maintains, that in compassion and love towards their neigh-

bours, the Turks excel all the rest of mankind; and this assertion is confirmed by several other travellers.

One remarkable instance of their charity may be seen in their hans, called by the Asiatics caravanferas, which are to be found in almost every little village. In these a traveller, of whatever religion or country, may continue three days gratis, and in many of them he is also found in victuals. The Turks are very fond of erecting these buildings, which they justly esteem a work of charity acceptable to the Most High. They behave very commendably to their slaves and servants, and frequently better than the Christians do to theirs. Indeed, in the first years of their servitude, these people suffer most, especially if young, the Turks endeavouring, partly by blandishments, and partly by severity, to bring them over to their religion; but these trials being happily over, captivity is no where more tolerable; so that if a servant understands any art or trade, the only thing he can want is his freedom, he being well supplied with every thing else.

The Turks are generally robust and well-shaped, of a good mien, and patient under hardships, which renders them fit for war, to which they early inure themselves. Persons of rank seldom train up their children to any other employment, from the notion that no glory is comparable to that acquired in war.

They are very particular in their dress, manner of living, and customs. They shave their heads, but wear long beards, of which they are extremely careful; except those in the seraglio, and military men, who wear only whiskers. The turban, or Turkish band, worn by the men is white, and consists of long pieces of thin linen made up together in several folds; and none but a Turk must presume to wear a white turban. Their clothes are long and full.

Agreeably to the custom of the orientals, they sit, eat, and sleep on the floor on cushions, or sophas, mattresses, and carpets. Rice is their general food, and coffee their usual drink, wine being forbidden.

They spend great sums of money on fountains, and no country affords finer; these are not only in the towns, but in the country, and other solitary places, for the refreshment of travellers and labourers.

Their usual salutation is bowing the head a little, laying the right hand on their breast; but to persons of rank they stoop so low as to touch and kiss the border of their vest. In war-time the left hand is the place of honour among military men, but this distinction ceases in time of peace among the officers of state and relations. The nobility among the Turks are the chief military officers, judges, and ecclesiastics. The Turkish commonalty enjoy the greatest liberty, and those only are exposed to the ticklish orders of the Porte, which must be answered with the head, who hold considerable posts.

The Greeks, who are the antient inhabitants of the country, are intermixed with the Turks, and in several places, particularly the islands, out-number them. Even in Constantinople alone there are computed to be no less than four hundred thousand. These people are accustomed to servitude, and prefer living under the exactions of the Turks to the spiritual tyranny of the pope; but they are obliged to be very cautious of not giving even the least colour for suspicion of their holding a correspondence with the enemies of the Ottoman Porte, or of meditating a sedition. Hence, in case of a war with any of the Christian powers, the Turks usually disarm them.

All the Greeks, from the age of fourteen, pay annually at the beginning of the Turkish feast of Bairam a poll-tax of about a ducat; but the ecclesiastics are assessed higher, a deacon paying two ducats; an archimandrite, four;

four; and the bishops, archbishops, and patriarchs, pay large sums, and as much as the arbitrary avarice of the grand vizier and bashas think proper to require; for the Turks every where lay hold of all opportunities of extorting money from the Greeks; but especially from their clergy. In return for this tribute, they enjoy the protection of the Ottoman Porte, and are maintained in the quiet possession of their properties; so that no Turk is to insult them, take their property, or intrude themselves into their houses against their will; and, in any of these cases, they are certain of justice being speedily executed on the offenders.

The Greek women are exempt from all taxes, as are likewise great numbers of other Greeks who serve in the navy, or elsewhere. Indeed it sometimes happens that a Greek girl of distinguished beauty is seized and carried to the seraglio; but it is a mistake that Christian children are in general forced away from their parents to be brought up in Mahometism; and when any thing of this kind is done, it is only in the distant provinces.

Foreign Christians, who are under the protection of an envoy, are included under the general title of Franks, and pay no poll-tax. We shall give an account of the other nations in the description of the particular provinces.

The principal language in Turkey in Europe is the Turkish; but the Greeks also speak the modern Greek; the Servians, Bosnians, and Bulgarians speak the Sclavonian; the Walachians and Moldavians, the Walachian; and the Tartars, the Tartarian language, which nearly resembles the Turkish. The literati commonly use the Arabic.

S E C T. III.

Of the Religions in Turkey in Europe; their Schools and Learning.

THE Turks appropriate to themselves the name of Moslemim, which has been corrupted into Musselman, signifying persons professing the doctrine of Mahomet. They also term themselves Sonnites, or observers of the oral traditions of Mahomet and his three successors; and likewise call themselves True Believers, in opposition to the Persians and others, the adherents of Ali, whom they call a wicked and abominable sect. Their rule of faith and practice is the Koran. Some externals of their religion are the prescribed ablutions, which are always to be performed before their devotions; prayers, which are to be said five times every twenty-four hours, with the face turned towards Mecca; alms, which are both enjoined and voluntary ones; the former consists of paying two and a half per cent. to charitable uses out of their whole income. Their feasts are either indispensable or voluntary ones; of the former is that of the whole month of Ramadan, which is followed by the Bairam, a time of festivity; and every Mahometan must, at least once in his life-time, go in pilgrimage, either personally or by proxy, to the Caba, or house of God, at Mecca.

Among the binding traditions not mentioned in the Koran is circumcision, which is performed betwixt the sixth and seventeenth year, but generally on the thirteenth. Indeed drinking wine is evidently prohibited in the Koran, yet the Turks make use of it occasionally without any scruple; but generally use instead of it sherbet, a liquor made of honey, spices, and the juice of fruits. Other things interdicted are games of chance, prophesying with arrows, and certain foods, as blood, pork; or the flesh of any beast that has died of sickness, or been killed by a wild beast, or by a fall or a stroke. Likewise the worshipping of idols, usury, and some superstitious and pagan practices. Polygamy is indeed permitted; but the Koran allows no man to have more than four wives and concubines, and to exceed that number is the particular privilege of the prophet and his successors: indeed few of the people have more wives than one. Divorces are also allowed; but no man may take back again the wife he has once repudiated, till she has been married to another, and afterwards divorced by him.

The chief ecclesiastic is the musti, which name signifies an expounder of the law, and his office is of such dignity, that when he comes to court, the emperor himself rises from his seat, and advances seven steps to meet him. He alone has the honour of kissing the sultan's left shoulder; while the grand vizier, with a more profound inclination of the body, kisses only the edge of the emperor's vest, who advances no more than three steps to meet him. The law requires, that the musti should be consulted on all emergencies, particularly in those relating to peace and war; but the peculiar regard now shown to him is little more than mere form; for were he either to give a disagreeable interpretation of the law, or, while in council, to presume to traverse the emperor's designs, he would be instantly deposed, and his place supplied by one of a more compliable disposition. On conviction of treason, or any other capital crime, he is put into a mortar, kept for that purpose in one of the seven towers at Constantinople, and pounded to death.

The Rev. Dr. Busching observes, that as the musti of the Turks may be compared to the pope, so a cadalisker, who is a secular person, is not unlike a patriarch; a mola is an archbishop; a cady, who is also a layman, may be accounted a bishop; and an iman, a priest, whose chief employment is praying.

The Turks have also their convents and monks, under the general name of dervises, the chief of which are the Bektashi, Mebelevi, Cadri, and Segati; whose forms of worship chiefly consists in certain religious dances.

The Turks at present avoid all appearance of propagating their religion by fire and sword; and the Christians of various sects, who reside amongst them, enjoy full liberty of conscience, and live in much greater tranquility than among some who stile themselves Christians.

The Greek church in this part of the world has at its head the patriarch of Constantinople, who is chosen by the neighbouring archbishops and metropolitans, and confirmed by the emperor or the grand vizier. This is a person of great dignity, he being the principal of all the Greek patriarchs, and the head and director of the Eastern church. His revenue amounts to no less than a hundred and twenty thousand guilders, one half of which he pays by way of annual tribute to the Ottoman Porte, adding six thousand guilders besides, by way of present at the feast of Bairam.

Subordinate to him are seventy archbishops and metropolitans, and a much greater number of bishops.

An archimandrite is the director of one or more convents, which are called mandren, and ranks above an abbot, of which each convent has one. The monks are obliged to follow some handicraft business, and lead a very austere life; but this is not the case with respect to the priests and students. The most celebrated monasteries are those on Mount Athos; but the Greeks have at present few nunneries.

The secular clergy are obliged to submit to no rules, though the regulars are, who perform divine worship. The first is the lecturer, the second the chanter, the third the under deacon, the fourth the deacon, the fifth the priest, and the sixth the archpriest. They are allowed to marry; but this must be done before ordination, and then only once, and that with a virgin. These secular ecclesiastics never rise higher than an archpriest; the bishops, metropolitans, archbishops, and patriarchs being chosen from among the monks.

The Armenians have many churches in this country; the Jews and Roman catholics have also the free exercise of their religion, and the Swedes have been permitted to build a Lutheran church at Constantinople.

The Turks are not without all kinds of learning, having some schools, colleges, and academies, by them called medaris; but these are generally inferior to those among the Christians, and their management of them also very different. Lately a Turkish printing-office has been set up at Constantinople by Abraham Effendi, who, after great opposition, obtained leave to print all kinds of books, except on matters of religion. He also published some maps, and books of history and geography, and is said to have had a considerable knowledge of the Latin tongue.

Literature, however, is not so rare among the Greeks, who have not only schools for instructing children in the principles of religion, as reading, writing, and learning by heart the Psalms and passages of Scripture; but have also universities, in which are taught grammar, Latin, and the mathematics, with the Aristotelian philosophy, both natural and moral. These are said to be at Demotica, in the island of Patmos, Jannina, and other places. Divinity is taught at the patriarch's palace at Constantinople, by a chaplain of the patriarch's and some assistants; but particularly on Mount Athos, which seems to be the pillar of the Greek church, and in other parts by the bishops, who are men of capacity, and take this trouble voluntarily upon them.

The state of learning, indeed, among the Greeks is at present at a very low ebb, in comparison of what it is among us; but it ought to be remembered, that they are destitute of the same means and opportunities of mental improvement. As to physic, the Greeks either learn from the Arabic, Jewish, or Christian physicians residing among them; or else study in the universities in Germany, Holland, or England.

S E C T. IV.

The Name, Origin, and History of the Turks, with a particular Account of their Government; the Power and Splendor of the Sultan, or Grand Seignior; his Titles, Officers of State, Janizaries, and other Troops. A Description of the Turkish Camp, and of the Procession made by the Tradesmen when they go to make their Presents, on the Sultan's commanding the Army in Person.

THE Turks are of Tartarian or Scythian extraction; and this appellation was first given them in the middle ages as a proper name; it being a general title of honour to all the nations comprehended under the two principal branches of Tartar and Mongul, who therefore never use it as a proper name of any Scythian or Tartarian nation. The word tur, as an adjective, signifies sublime and pre-eminent; and, as a substantive, a governor. The Scythian or Tartarian nation, to which the name of Turks has been peculiarly given, dwelt betwixt the Black and Caspian seas, and became first known in the seventh century, when Heraclius, emperor of the East, took them into his service; upon which they so distinguished themselves by their fidelity and bravery in the conquest of Persia, that the Arabian and Saracen caliphs had not only particular bodies of them for guards, but their armies were filled with them. Thus gradually getting the power into their hands, they set up and dethroned caliphs at pleasure. By this strict union of the Turks with the Saracens or Arabs, the former were brought to embrace the Mahometan religion, so that they are now become intermixed, and have jointly enlarged their conquests: but as the Turks became superior to the Saracens, they subdued them.

Prince Cantemir gives the following account of the origin of the Ottoman empire.

Genghisikan, at the head of his horde, issued out of Great Tartary, and made himself master of a vast tract of land near the Caspian sea, and even of all Persia and Asia Minor. Incited by his example and success, Schah Solyman, prince of the town of Nera, on the Caspian sea, in the year 1214, passed Mount Caucasus with fifty thousand men, and penetrated as far as the borders of Syria; and though his career was stopped there by the Genghisikan Tartars, yet in the year 1219 he penetrated a second time into Asia Minor as far as the Euphrates. Othman, his grandson, made himself master of several countries and places in Lesser Asia belonging to the Grecian empire; and having, in the year 1300, at the city of Carachiser, assumed the title of emperor of the Ottomans, called his people after his own name. This prince, among many other towns, took, in the year 1326, Prusa, in Bithynia, now called Bursa; which Orchan, his son and successor, made the seat of his empire. Orchan sent Solyman and Amurath, his two sons, on an expedition into Europe; the former of whom reduced the city of Callipolis, and the latter took Tyrilos. Amurath suc-

ceeding his father in the government in 1360, took Ancyra, Adrianople, and Philippopolis; and in 1632 instituted the janizaries, over-run Servia, and invaded Macedonia and Albania. Bajazet, his son and successor, was very successful both in Europe and Asia, defeating the Christians near Nicopolis; but, in 1401, he was routed and taken prisoner by Tamerlane. His sons disagreed; but Mahomet I. enjoyed the sovereignty, and his son Amurath II. distinguished himself by several important enterprizes, and particularly in the year 1444 gained a signal victory over the Hungarians near Varna. Mahomet II. the greatest of all the emperors, in 1453, made himself master of Constantinople, and reduced the whole Grecian empire under his dominion, subduing twelve kingdoms and two hundred towns. After this Bajazet II. and Selim I. enlarged the Turkish empire in Europe, Asia, and Africa; and Solyman I. became less famous for his victory over the Hungarians than his body of laws.

In short, the succeeding emperors were less successful; for though Mahomet IV. subdued Candia, and laid siege to Vienna, he met with ill success in Hungary; and in the reigns of Solyman II. Achmet II. and Mustapha, the Hungarians and Venetians were so successful against the Turks, that Mustapha II. in 1699, was glad to conclude the peace of Carlowitz. Mahomet III. in 1718, agreed to the peace of Passarowitz; but Achmet V. by the peace of Belgrade, in 1739, re-annexed Servia, a part of Walachia, and Chozim to the empire.

The first sultans, or emperors, owing their success purely to their own valour, and being filled with maxims of war, would have a blind obedience paid them; they punished with severity, and laboured to keep their subjects under an inability to revolt; and, in short, would be served only by persons who stood indebted to them for their fortunes, whom they could advance without jealousy, and crush without being charged with injustice. These maxims which have continued amongst them above five centuries, render the sultan absolute master of the empire.

When there is a new emperor, or sultan, it is the custom to conduct him with great pomp and triumph to a place in the suburbs of Constantinople, called Job, where is an antient monument of one of their holy men of that name. At this place solemn prayers are made that God may prosper the sultan, and infuse wisdom into him who is to manage so great a charge. The musti then embracing him bestows his blessing, and the emperor solemnly swears to maintain the laws of the prophet Mahomet. Then the viziers of the bench, and other bashas, with profound humility, kiss the ground and the hem of his vest, acknowledging him their lawful emperor. After this form of inauguration, he returns with the like solemnity to the seraglio. Thus he obliges himself to govern within the compass of the law; but the Turkish doctors restrain the imperial oath only to the observation of the religious part of the Mahometan law, and say, that in civil matters it is so arbitrary, as to need no other judge than his will.

The sultan's cloaths differ little in fashion from those of other men, only they exceed them in length and richness. His turban resembles those of the bashas; but he wears plumes with gold clasps, which they do not. He sleeps upon mattresses of velvet and cloth of gold, covered in summer with sheets embroidered with silk, and in winter with fables.

When he goes by water, he is carried in his barge, covered with a canopy of crimson velvet richly embroidered, under which he sits, while his agas stand about him. The vessel is rowed by the Aglain Oglans, and steered by the Bostangee Basha. When he goes by land, he always rides on horseback, and commonly proceeds out of the great gate of the palace. On his going to the mosque on Fridays, he is accompanied through the city by all the bashas and grandees of the Porte. The lady Wortley Montague says, that when she saw the Grand Seignior in his passage to the mosque, he was preceded by a numerous guard of janizaries, with vast white feathers on their heads; as also by the spahis and bostangees, who are foot and horse guards, and the royal gardeners, which are a very considerable body of men, dressed in different habits

habits of fine lively colours, so that at a distance they appeared, says she, like a parterre of tulips. After them the aga of the janizaries, in a robe of purple velvet, lined with silver tiffue, his horse led by two slaves richly dressed. Next him the kishler-aga, who is the chief guardian of the ladies of the seraglio, in a deep yellow cloth, (which suited well with his black face) lined with fables. Last came the sultan himself, arrayed in green, lined with the furs of black Muscovite foxes, supposed worth about a thousand pounds sterling, and mounted on a fine horse, with furniture embroidered with jewels. Six more horses richly caparisoned were led after him; and two of his principal courtiers bore, one his gold, and the other his silver coffee-pot, on a staff; another carried a silver stool on his head, for him to sit on. It would be too tedious, says that lady, to describe the various dresses and turbans by which they are distinguished; but they were all extremely rich and gay, to the number of some thousands; so that, perhaps, there cannot be seen a more beautiful procession.

The titles of the emperor, according to the custom of the East, are very prolix and magnificent, as will appear from the following specimen. We, the servant and lord of the most honoured and blessed cities, the venerable houses, and sacred places, before which all nations bow; of Mecca, which God delights to honour; of the resplendent Medina, and the holy city of Jerusalem; of the imperial and desirable cities of Constantinople, Adrianople, and Bursa, emperor; also of Babylon, Damascus, of the fragrant Paradise, and the incomparable Egypt; of all Arabia, Aleppo, Antioch, and many other highly celebrated and memorable places, cities, and faithful vassals, emperor; emperor of emperors, the most gracious and all-powerful sultan, &c.

The Turkish arms are a crescent.

In the succession to the empire no regard is paid to age or birth-right, the Turks esteeming it sufficient, if, in their elections, they keep to the Ottoman family: but women are excluded from the throne. Though the government is purely monarchical and despotic, yet if the emperor takes no care to indulge the humours of the people, and especially of the mutinous janizaries, he is not only in danger of being deposed, but also of being murdered.

The emperor's divan, or council of state, meets twice a week in the emperor's palace, that is on Sundays and Thursdays. The grand vizier, who sits as president, has on his right hand the cadinaskier of Romelia, and on his left that of Natolia. The musti also assists when expressly summoned. All the other viziers have likewise a seat here, and next to them stand on one side the tefterdar, or high-treasurer, the reis-effendi, or secretary of state, and other commissioners of the exchequer; but the military officers, as the aga of the janizaries, the aga of the spahis, the aga of the filuds, &c. sit within the divan. These several members wear a particular habit. The sultan does not enter the room; but hears what passes from an adjoining chamber, which looks into the divan.

When he convenes a general council, to which all the great persons of the empire are summoned, as the clergy, the military and other officers, and even the old and most experienced soldiers, such a divan is called *ajak divani*, the whole assembly standing.

The highest office, next to the sultan, is the vizier *azem*, or grand vizier, who has the care of the whole empire, and is not only entrusted with the management of the revenue, with foreign affairs, and the administration of justice in civil and criminal concerns; but also with the conduct of wars, and the command of armies. When the sultan nominates this great officer, he puts into his hand the seal of the empire, upon which is engraven his name. This is the badge of his office, and he always carries it in his bosom. With this seal he dispatches all his orders, without consulting any one. His power is unlimited, except with respect to the troops, which he cannot punish without the consent of the commanders. All affairs are decided by his judgment; and he disposes of all the posts in the empire, except those of judicature.

The grand vizier lives in the utmost splendor; he has above two thousand officers and domestics in his palace,

and when he appears in public has his turban adorned with two plumes of feathers, charged with diamonds and precious stones; the harness of his horse is usually set with rubies and turquoises, and his housing richly embroidered with gold and pearls. His guard is composed of about four hundred Bosnians, or Albanians, some of whom attend him on foot when he goes to the divan; but when he marches into the field, they are all well mounted, and carry a lance, a sword, a hatchet, and a brace of pistols. He is preceded by three horse tails, on the top of which is a gold ball. This is the military ensign of the Ottomans; for one of their generals being at a loss how to rally his troops, who had lost all their standards, cut off a horse's tail, and erecting it on the point of a lance, the soldiers flocked to this new ensign, renewed their attack, and came off with victory.

When the sultan honours the grand vizier with the command of an army, he takes out one of the plumes of his own turban, and delivers it to him to place in his own. Upon his receiving this mark of distinction, the soldiers acknowledge him for their general. The grand vizier's income, without his being guilty of any injustice, amounts to about six hundred thousand dollars a year, exclusive of presents and other perquisites. But, notwithstanding the greatness of his revenue, and the splendour in which he lives, he is in continual danger, it being the usual policy of the emperors to screen themselves from the clamours of the people, by throwing the whole blame of any instance of male-administration on this officer, and giving him up to the public resentment.

While the emperor resides at Constantinople, or Adrianople, he is without any power; but if he be only eight hours distant from the city, his authority is little less than that of the grand vizier.

When the emperor takes the field in person, he nominates a *kaimakan* out of such viziers as are permitted to carry three horse tails. This officer, in case the grand vizier be at the distance of eight hours from the emperor, has the full power and management of all affairs; but is not to act contrary to the grand vizier's instructions. This *kaimakan* ought not to be confounded with the governor of Constantinople, or Adrianople, who bears the same title.

Next to the grand vizier are six others, styled viziers of the bench, or council, and *bashas* of the three horse tails; because, when they march, three horse tails are carried before them, while only one is carried before the ordinary *bashas*. These viziers ought to be men distinguished by their wisdom, and their knowledge of the laws. They assist at the divan, but never deliver their opinion upon the affairs which are treated there, unless required by the grand vizier. These have each two thousand crowns a year, and the grand vizier often refers matters of small consequence to them, as well as to the ordinary judges. *Cady* is a word used for all judges of a province or particular place.

A *beglerbeg* is a viceroy, with several provinces under his command, the name itself signifying a prince of princes. The three principal are the *beglerbeg* of Rumili, who resides at Sophia; the *beglerbeg* of Natolia, the seat of whose government is at Cutahia, and the *beglerbeg* of Damascus, who keeps his court in that city. Under these are the *bashas* or governors, whose posts are very considerable, but precarious; and subordinate to these are the *sangiacs*, who may be termed deputy-governors. These are all military officers.

The *reis-effendi*, also called the *reis-kital*, is lord chancellor and secretary of state. His name signifies chief of the writers. He attends on the vizier, to pass orders, decrees, patents and commissions, into all parts of the empire, which are daily dispatched in incredible numbers, and therefore he employs a multitude of clerks in his office.

With respect to the national revenues, they are returnable to two treasuries; the public treasury, and the treasury of the *musselmans*. The public treasury is under the management of the *tefterdar*, or high treasurer, who has under him twelve offices, to which all the revenues of the empire, arising from tributes, customs, &c. are returnable, and out of these the army is paid. The treasurer is allowed five per cent. of all the money brought

brought into the treasury, which must bring him in at least two hundred thousand dollars annually. One fourth of the money he receives he pays to the kietchudabeg, or kahya, who is the grand vizier's commissary, and above the tefterdar. The money of this treasury, called the public money of the musselmans, is not to be touched by the emperor but in the greatest exigency, much less for private occasions. The sultan's private treasury, which he disposes of according to his own pleasure, is under the care of the hasnadar baschi, who is the next person in rank to the kislar in the seraglio. Prince Cantemir says, that in his time, twenty-seven thousand purses, amounting to thirteen millions and a half of rix-dollars, were annually returned to both treasuries. The confiscations of the estates and effects of the bashas, and other officers, together with the money arising from the escheats of Turks dying without male issue, make also a very considerable article.

The janizaries are the flower of the Turkish forces, they are all infantry, and were first formed of captive Christians by the emperor Amurath I. Their number generally amounts to forty thousand, divided into a hundred and sixty-two companies, or chambers, called odas, in which they live together at Constantinople, as in a convent. The janizaries are of a superior rank to all other soldiers; but are also more arrogant and factious, and it is by them the public tranquillity is mostly disturbed. "The government, says the lady Wortley Montague, "is entirely in the hands of the army. The grand "signior with all his absolute power, is as much a slave "as any of his subjects, and trembles at a janizary's "frown. Here is, indeed, a much greater appearance "of subjection than amongst us: a minister of state is "not spoke to but upon the knee; should a reflection "on his conduct be dropped in a coffee-house (for they "have their spies every where) the house would be razed to the ground, and perhaps the whole company "put to the torture. No huzzaing mobs, senseless "pamphlets, and tavern disputes about politics. When "a minister here displeases the people, in three hours "time he is dragged even from his master's arms. They "cut off his hands, head and feet, and throw them before the palace gate, with all the respect in the world; "while the sultan, to whom they all profess an unlimited adoration, sits trembling in his apartment, and "dare neither defend, nor revenge his favourite."

The janizaries have, however, some good qualities; they are employed to escort travellers, and especially ambassadors, and persons of high rank, on the road, in which case they behave with the utmost zeal and fidelity. The ingenious and learned lady, whom we have just mentioned, happening to bespeak some pigeons for supper at a village near Philippopolis, one of the janizaries went immediately to the cady, the chief civil officer of the town, and ordered him to send in some dozens. The poor man answered, that he had already sent about, but could get none; upon which the janizary, in the height of his zeal for that lady's service, immediately locked him up prisoner in his room, telling him he deserved death for his impudence, in offering to excuse his not obeying her commands; but out of respect to the lady, he would not punish him but by her order. Accordingly he came very gravely to her, to ask what should be done to him; adding by way of compliment, that, if she pleased, he would bring her his head. "This, says "the lady Montague, may give some idea of the unlimited power of these fellows, who are all sworn brothers, and bound to revenge the injuries done to one "another, whether at Cairo, Aleppo, or any other part "of the world. This inviolable league makes them so "powerful, that the greatest man at court never speaks "to them, but in a flattering tone."

The capis are also infantry; the spahis light horse; but the timar spahi, or, the old and preferred spahis, instead of pay, have villages in several of the provinces, and are obliged, according to their income, to bring at least three slaves with them into the field.

The tributary princes, as the cham of the Crim Tartars, and the princes of Moldavia and Walachia, are obliged to send auxiliaries. In short, the whole Turkish army is composed of above three hundred thousand men.

When the Turks are encamped, the tents make a very magnificent appearance. Those of the great men are rather like palaces than tents, taking up a great compass of ground, and being divided into a great number of apartments. They are all green, and the bashas of three tails have those ensigns of their power placed in a very conspicuous manner before their tents, which are adorned on the top with gilded balls, more or less, according to their different ranks.

When the sultan is resolved to lead his army in person, all the companies of tradesmen are obliged to make him a present according to their ability; and, on this occasion, they make a very splendid procession through the principal streets, while the sultan views them from one of the windows of his seraglio. When our author saw this cavalcade, it was preceded by an effendi, mounted on a camel, reading aloud the Koran, finely bound, and placed upon a cushion. He was surrounded by a parcel of boys in white, singing some verses of it, followed by a man dressed in green boughs, representing a husbandman sowing seed. After him several reapers, crowned like Ceres, with ears of corn; they had also scythes in their hands, and seemed to mow. Then a little machine drawn by oxen, in which was a windmill, and boys employed in grinding corn, followed by another machine drawn by buffaloes carrying an oven, and two more boys, one employed in kneading bread, and the other in drawing it out of the oven. These boys also threw little cakes on both sides amongst the crowd, and were followed by the whole company of bakers, marching on foot two by two, in their best cloaths, with cakes, loaves, pasties and pies of all sorts on their heads, and after them two buffoons, with their faces and cloaths smeared with meal, who diverted the mob with their antic gestures. In the same manner followed all the other trading companies; the jewellers, mercers, &c. finely mounted, and many of the pageants representing their trades, truly magnificent; amongst which that of the furriers made one of the best figures, it being a very large machine set round with the skins of ermines, foxes, &c. so well stuffed, that the animals seemed alive, and were followed by music and dancers. The rear was closed by the volunteers, who came to beg the honour of dying in the sultan's service; they were all naked to the middle. Some had their arms pierced through with arrows left sticking in them. Others had them sticking in their heads, the blood trickling down their faces. Some flashed their arms with sharp knives, making the blood spring out upon the by-standers; which is looked upon as an expression of their zeal for glory. 'Tis said that some make use of these arrows and knives to advance their love, and when they are near the window where their mistress stands, (for all the women are veiled to see this spectacle) they stick another arrow for her sake, who gives some sign of approbation and encouragement to this gallantry.

SECT. V.

The Officers of the Seraglio, and the Regulations observed there with respect to the Women; the Splendor of their Dress, and the Magnificence in which they live.

THE principal officers of the seraglio are the eunuchs, who are in the highest confidence; for being entirely disengaged from love intrigues, they resign themselves wholly to ambition and the care of obliging their sovereign. The white eunuchs are employed in the service of the sultan, and the black wait upon and guard the women. These are forced to use a silver pipe in making water; they being deprived of the natural conveniency in their infancy; for the sultans were jealous of them, while they were made eunuchs in the ordinary manner, and on this account they are cut smooth close to the belly; a dangerous operation, that costs many of them their lives.

The capi-aga, or chief of the white eunuchs, is treated in the same manner in his youth, and is the great master of the seraglio. He has the inspection of all the pages of the palace, and all petitions which are to be presented

Lady Mary Wortley Montague visits the Sultana Hafsen.

presented to the prince are delivered to him. He is in the secret of the cabinet, and has the command of all the eunuchs of his own complexion. The principal of these eunuchs are, the great chamberlain, who has forty pages under him, that wait on the sultan: the deputy-supervisor of the pages apartment, and other buildings of the palace, who particularly takes care of their linen and wearing apparel: the sultan's privy-treasurer, who keeps the jewels of the crown, and one of the keys of the sacred treasure: the kilargi bashi, or grand expeditor of the seraglio, who is also great master of the wardrobe; it is his office also to look after the sultan's sweet-meats and drinks, the syrups, sherbet, and counter-poisons; he also takes care of the sultan's china-ware: the other white eunuchs are, the preceptors to the pages, the overseer of the infirmary, the great falconer, the overseer of the baths, and other officers who wait on the sultan's person.

The kyser-aga is the chief of the black eunuchs, and has the absolute command of the women's apartments, and all the other black eunuchs placed there pay him an implicit obedience. He has the superintendence of all the royal mosques of the empire, and disposes of all the offices that belong to them. The principal of the other black eunuchs are, the eunuch of the queen mother, the governor of the princes of the blood, the comptroller of the queen mother's treasury, the steward of her perfumes, sweet-meats, and liquors, the two chiefs of the great and little chamber of the women, with some others.

In the seraglio there are also musicians, buffoons, tumblers, dwarfs, and mutes.

All who live in the seraglio are the sultan's slaves, as indeed are all the subjects of his empire; for they acknowledge, that whatever they enjoy proceeds from his bounty, and that their estates and lives are absolutely at his disposal.

The women in the sultan's court, including the old and the young, amount to about twelve hundred. His concubines are beautiful and accomplished virgins, who have been stolen or purchased when children from Georgia, Circassia, or the neighbouring countries, and received an education that renders them well qualified in the arts of pleasing, such as singing, playing upon musical instruments, dancing, dressing to the best advantage, an engaging behaviour, and great skill in curious needle-work, particularly embroidery.

It is generally said, that the first of these ladies who conceives by the sultan, and brings forth a child, is stiled sultana queen; and, if it be a son, is confirmed and established by great festivals: thenceforward she has magnificent apartments, a great number of servants, with a large revenue, and all persons in the seraglio must pay her the respect due to a queen. The other women who bear him children are called sultanas, but not queens, yet live in separate apartments, which are extremely splendid; they are well served and attended, and are in no want of money, jewels, or the richest apparel: but if it happens that the heir of the empire dies, and another of the sultanas has a son to succeed the deceased heir, it is said that the sultana queen loses her title and rank, and another becomes queen in her stead; so that the title runs from one sultana to another, in virtue of the son's right to the succession.

The sultan was formerly married to the queen, but she now possesses that title without the celebration of any nuptial rites, and yet enjoys all the prerogatives of royalty, with a guard of thirty or forty black eunuchs, under the command of the kyser-aga.

The sons of the sultan, by the sultana queen, are all brought up by themselves, and have nurses provided for them. His sons by the other sultanas are also brought up by themselves; but they may play with each other till they are six or seven years of age. They live nine or ten years with the women, and at about fourteen are circumcised with great pomp. When the sultan's eldest son is circumcised, he is sometimes sent with a suitable equipage, under the care of a trusty eunuch, to be governor of Magnesia, in Natolia; but the eunuch is bound to send continual advice to the sultan of his son's behaviour; so that if he exceeds the limits of his commission, he soon falls into disgrace.

The daughters, sisters, and aunts of the emperor lodge in the same seraglio; and, being richly dressed and royally attended, live by themselves in continual pleasures, till the sultan gives them in marriage to the great officers of his court, or the governors of provinces. They are said to carry out with them a chest, presented by the sultan, filled with rich cloaths, jewels, and money, to the value of about thirty thousand pounds sterling, besides what they have saved, which sometimes amounts to a great sum: and if the Grand Seignior has a particular respect for them, he even continues their allowance of a thousand or fifteen hundred aspers a day. As for the husband, he is to make her a bill of dowry of at least a hundred thousand chequins in money, besides cloaths, jewels, and other ornaments. They, however, converse with no other men besides their husbands; and, with the sultan's leave, are allowed to visit their old acquaintance in the seraglio. These are the only women in Turkey who claim the privilege of having a man to themselves. They assume the state of queens, and have their husbands in the same subjection as other Turkish husbands have their wives; and they are said to oblige them to put away the rest of their women, how long soever they have lived with them.

Authors have given very incredible descriptions of the manner in which these ladies live in the seraglio, and of the treatment they receive from the sultan; but as it is evident, even from their own account, that they never so much as saw one of these ladies, and that they had no possible means of coming at the knowledge of what they describe, we shall pass them over as the fictions of travellers; and conclude this section with part of a letter wrote by an English ambassador on this subject, who writes from her own knowledge, and, from her rank and sex, had an opportunity of seeing what is carefully concealed from every man. Though the lady she describes had left the seraglio, yet she still seems to have kept up the way of life she led there; and, indeed, all that is said of her will give the reader a better idea of the splendor in which those ladies live, than any thing that has been written on the subject.

"I went, says this learned and polite writer, to see the sultana Hafiten, favourite of the late emperor Mustapha, who was deposed by his brother, the reigning sultan, and died a few weeks after, being poisoned, as it was generally believed. This lady was, immediately after his death, saluted with an absolute order to leave the seraglio, and choose herself a husband among the great men of the Porte. I suppose you may imagine her overjoyed at this proposal.—Quite the contrary.—These women, who are called, and esteem themselves queens, look upon this liberty as the greatest disgrace and affront that can happen to them. She threw herself at the sultan's feet, and begged him to pardon her, rather than use his brother's widow with that contempt. She represented to him, in agonies of sorrow, that she was privileged from this misfortune by having brought five princes into the Ottoman family; but all the boys being dead, and only one girl surviving, this excuse was not received, and she was compelled to make her choice. She chose Bekir Effendi, then secretary of state, and above fourscore years old, to convince the world that she firmly intended to keep the vow she had made, of never suffering a second husband to approach her bed; and since she must honour some subject so far as to be called his wife, she would choose him as a mark of her gratitude, since it was he that had presented her at the age of ten years to her last lord. But she never permitted him to pay her one visit; though she has been fifteen years in his house, where she passes her time in uninterrupted mourning, with a constancy very little known in Christendom, especially in a widow of one and twenty; for she is now but thirty-six. She has no black eunuchs for her guard, her husband being obliged to respect her as a queen, and not to enquire at all into what is done in her apartment.

"I was led into a large room, with a sofa the whole length of it, adorned with white marble pillars, covered with pale blue figured velvet, on a silver ground,

“with cushions of the same, where I was desired to repose till the sultana appeared, who had contrived this manner of reception to avoid rising up at my entrance, though she made me an inclination of the head when I rose up to her. I was very glad to observe a lady that had been distinguished by the favour of an emperor, to whom beauties were every day presented from all parts of the world. She had the remains of a fine face, more decayed by sorrow than time. But her dress was something so surprisingly rich, that I cannot forbear describing it to you. She wore a vest called a dualma, which differs from a caftan by its having longer sleeves, and folding over at the bottom. It was of purple cloth straight to her shape, and thick-set on each side down to her feet and round her sleeves, with pearls of the best water, of the same size as their buttons are; that is, about the bigness of a pea, and to these buttons large loops set with diamonds. This habit was tied at the waist, with two large tassels of smaller pearls, and round the arms embroidered with large diamonds. Her shift was fastened at the bottom with a great diamond, shaped like a lozenge; her girdle as broad as the broadest English ribbon, entirely covered with diamonds. Round her neck she wore three chains, which reached to her knees; one of large pearls, at the bottom of which hung a fine coloured emerald as big as a turkey egg; another consisting of two hundred emeralds close joined together, of the most lively green, perfectly matched, every one as large as a half-crown piece, and as thick as three crown pieces; and another of small emeralds perfectly round. But her ear-rings eclipsed all the rest. They were two diamonds shaped exactly like pears, as big as a large hazle-nut. Round her talpoche she had four strings of pearl, the whitest and most perfect in the world, fastened with two roses, each consisting of a large ruby for the middle stone, encircled with diamonds. Besides this, her head-dress was covered with bodkins of emeralds and diamonds. She wore large diamond bracelets, and had five rings on her fingers, with the largest diamonds (except Mr. Pitt's) I ever saw in my life. 'Tis for jewellers to compute the value of these things; but, according to the common estimation of jewels in our part of the world, her whole dress must be worth a hundred thousand pounds sterling. This I am sure of, that no European queen has half the quantity; and the empress's jewels, tho' very fine, would look very mean near hers.

“She gave me a dinner of fifty dishes of meat, which, after their fashion, were placed on the table but one at a time, and was extremely tedious. But the magnificence of her table answered very well to that of her dress: the hafts of the knives being of gold set with diamonds. But the piece of luxury which grieved my eyes was, the table-cloth and napkins, which were all tiffany embroidered with silk and gold, in the finest manner in natural flowers. It was with the utmost regret that I made use of these costly napkins, which were as finely wrought as the finest handkerchiefs that ever came out of that country. You may be sure they were entirely spoiled before dinner was over. The sherbet was served in china bowls, but the covers and salvers massy gold. After dinner water was brought in gold basons, and towels of the same kind with the napkins, which I very unwillingly wiped my hands upon, and coffee was served in china, with gold saucers.

“The sultana seemed in a very good humour, and talked to me with the utmost civility. I did not omit this opportunity of learning all that I possibly could of the seraglio, which is so entirely unknown among us. She assured me that the story of the sultan's throwing a handkerchief, is altogether fabulous; and the manner upon that occasion no other than this: he sends the kysser aga to signify to the lady the honour he intends her. She is immediately complimented upon it by the others, and led into the bath, where she is perfumed and dressed in the most magnificent and becoming manner. The emperor precedes his visit by a royal present, and then comes into her apartment. Neither is there any such thing as her creeping in at

“the bed's foot. She said, that the first he made choice of, was always after the first in rank, and not the mother of the eldest son, as other writers would make us believe. Sometimes the sultan diverts himself in the company of all his ladies, who stand in a circle round him. And she confessed they were ready to die with envy and jealousy of the happy she, that he distinguished with any appearance of preferment. But this seemed to me neither better nor worse than the circles in most courts, where the glance of the monarch is watched, and every smile waited for with impatience, and envied by those who cannot obtain it.

“She asked me to walk in her garden, and one of her slaves immediately brought her a pellice of rich brocade lined with fables. I waited on her into the garden, which had nothing in it remarkable but the fountains, and from thence, she shewed me all her apartments. In her bed-chamber her toilet was displayed, consisting of two looking-glasses; the frames covered with pearls, and her night talpoche set with bodkins of jewels, and near it three vests of fine fables, every one of which is at least worth two hundred pounds English money. I don't doubt but these rich habits were purposely placed in sight, though they seemed negligently thrown on the sofa. When I took my leave of her, I was complimented with perfumes, and presented with a very fine embroidered handkerchief. Her slaves were to the number of thirty, besides ten little ones, the eldest not above seven years old. These were the most beautiful girls I ever saw, all richly dressed, and I observed that the sultana took a great deal of pleasure in these lovely children, which are a vast expence; for there is not a handsome girl of that age, to be bought under a hundred pounds sterling. They wore little garlands of flowers, and their own hair braided, which was all their head-dress; but their habits are all of gold stuffs. These served her coffee kneeling; brought water when she washed, &c. 'Tis a great part of the business of the older slaves to take care of these young girls, to teach them to embroider, and to serve them as carefully as if they were children of the family.”

SECT. VI.

Of the Manufactures, Trade, and Coin of Turkey in Europe.

THE Turks have very curious and beautiful manufactures. The inland trade too, which the provinces, towns, and inhabitants carry on with each other, and with foreign nations, is very considerable; though it is chiefly through the channel of the Jews and Armenians. The Turks, indeed, convey both by land and water the products of the country and other goods from one province to another; but not to foreign Christian countries: great numbers of English, Dutch, French, Italian, and Spanish ships, as well as those of other trading nations, repairing in great numbers to the harbours in Turkey, where they import their goods, and purchase those of the country. They have also their envoys and residents at Constantinople, and their consuls in other ports.

The exports from Turkey are silks, beautiful carpets, goats hair and wool, camels hair, cotton yarn, burdets, dimity, waxed linen, shagreen skins, blue, red, and yellow leather, coffee, rhubarb, turpentine, storax, gums, saffron, opium, galls, mastich, emery, Lemnian bole, pomegranate shells, sponges, dates, almonds, wine, oil, figs, raisins, mother of pearl, box-wood, wax, &c. The traffic of the human species, however shocking it may appear at first sight, is infinitely less cruel than that carried on by the Christians on the coast of Guinea: this is a considerable part of their commerce; for they not only sell slaves of both sexes, but also beautiful young girls, who are bought up, particularly by the Jews in Circassia, Georgia, Greece, and other countries; their parents and relations readily parting with them, in hopes of raising their fortune.

The English Turkey merchants export thither broad cloth, long ells, tin, iron, sugar, watches, some bullion, and many other articles.

The

The gold and large silver coin of all countries are current in Turkey, more especially the cross dollars of Burgundy, and the Dutch lion dollars, which they term *allem*.

The proper coins of the country are, first those of gold; namely, the *altines*, or *ducats*, which are worth about seven shillings; and the *zechinos*, worth about nine shillings. Large sums are reckoned by purses; a purse being one hundred and eight pounds six shillings and eight pence.

The silver coin consists of the *solato*, worth about two shillings and two pence farthing; the *krip*, of the value of about eleven pence; the *grosch*, about three pence; the *para*, worth three aspers; an *asper* is of the value of about three half pence.

S E C T. VII.

Of the MOREA, anciently called the PELOPONNESUS.

Its Situation, Extent, Name, Rivers, Lakes, Soil, and Produce. With a Description of all the principal Cities and Towns in that Peninsula.

THE Morea is a large peninsula on the southern part of Greece, to which it is joined by the isthmus of Corinth, which extends between the gulphs of Lepanto and Engia, and in its narrowest part is not above four or five miles over. It lies between the thirty sixth degree twenty-three minutes, and the thirty-eighth degree seventeen minutes latitude; and between the twenty-first degree twenty minutes, and the twenty-fourth degree eight minutes east longitude from London. Its greatest breadth from south to north, or from Cape Matapan to the straits of Lepanto, is about one hundred and fifteen miles, and its greatest length east and west one hundred and twenty: but in many places it is much narrower and shorter, on account of the many gulphs, bays, and inlets all round the coast.

Its present name of Morea is said to be derived from *Morus*, a mulberry-tree, either from its resembling in its form the mulberry leaf, or from the great number of mulberry-trees it produces.

Its chief rivers are the *Carbon*, anciently the *Alpheus*; the *Pirnaza*, anciently the *Panifus*; and the *Eurotas*, now called the *Basilipotama*. Of the lakes, the most celebrated among the ancients was the *Stymphalus*, famous for the many ravenous birds which resorted to it; and the *Phineus*, for being the source of the river *Styx*, whose water is said to be so cold as to freeze those to death who drink it, and to corrode iron and copper, for which extraordinary qualities the poets have made it one of the rivers of hell.

This peninsula, notwithstanding its small extent, contained the kingdoms of *Sicyon*, *Argos*, and *Mycene*, *Corinth*, *Proper Achaia*, *Arcadia*, and *Sparta*, and was distinguished by the splendor of its cities, the courage and virtue of its ancient inhabitants, and the power of the several states; as well as by the fertility of its soil, which produces plenty of corn, wine, oil, most delicious fruits, and every thing that can contribute to the delight, as well as the necessities of life. Indeed the middle part, which contained the ancient *Arcadia*, being more mountainous, is not so fruitful, and therefore most of the inhabitants were formerly shepherds, the soil being more proper for pasture than agriculture. However, even in that part there are several fertile valleys, that would produce plentiful crops, were they well cultivated.

The country is divided into four parts, *Belvedera*, *Chiarenza*, *Brazzo di Maina*, and *Saccaria*.

Belvedera, the most southern part, contains the ancient *Elis* and *Messenia*; and has the following places of note.

Coron, one of the most considerable towns in the Morea, is situated on the south side of a gulph to which it gives its name, about seventeen miles from Cape Gallo. It is strong both by nature and art. The city is of a triangular form, and opposite one of its angles is a large tower built on a rock. The town, where it is not washed by the sea, is defended by a fortress, encompassed by old thick walls, flanked with large towers.

At a small distance from the town is a suburb, consisting of about five hundred houses. The adjacent country affords plenty of fruit, corn, oil, and silk, which the inhabitants export with great advantage.

Modon, the ancient *Methone*, is seated on the southern shore, opposite the isle of *Sapienza*, and stands on a hill which projects into the sea, at the foot of which is a good harbour. It is a strong, rich, and trading city, the residence of the governor of the Morea, and a bishop's see.

Navarino, the ancient *Pylus*, stands on a rising ground, at the foot of which is the harbour, which is esteemed the best and most capacious of all the Morea, it being able to contain two thousand vessels. It is defended by two castles, one of which stands on a high mountain, and commands the entrance into the harbour on the north side, the other defends the entrance on the south, and at same time defends the city.

Arcadia, formerly *Cyparissa*, is now a mean place, from which a bay takes its name.

Langanico, the ancient *Olympia*, is seated on the river *Carbon*, and was once famous for the games celebrated on the neighbouring plains, every fifth year, from which the computation of time by olympiads took its rise. In this city was also a fine temple of *Jupiter Olympius*, in which the image of that god, which was of an amazing size and beauty, and esteemed one of seven wonders of the world. This city is now but a small and inconsiderable town.

Belvedere, by the Greeks called *Calloscopium*, is situated on the spot where the ancient capital of *Elis* stood. The town received its name from the delightful places round it.

The next division called *Chiarenza* or *Clarenza*, contains *Achaia*, properly so called, together with the following places, viz.

Chiarenza, or *Clarenza*, a pretty good town, seated at the bottom of a gulph on the western shore of the Morea; but it suffered much in the last Venetian war.

Patras, *Patrasio*, by the Turks called *Badra*, or *Balubathra*, is situated upon a hill at the foot of a high mountain, not a mile from the sea. This city is governed by a *cady*, who determines all controversies: here is also a *waywode*, who executes the determinations of the *cady*, and gathers the taxes and duties upon merchandize and provisions. The Turks, who are about a third part of the inhabitants, have six mosques here, one of which was formerly a cathedral church. The Jews, who make also another third part, have four synagogues, and a kind of policy among themselves; for they choose ancient men or elders to decide all the differences that arise amongst them. The whole number of Christians, Jews, and Turks, is computed to amount to about four or five thousand persons. It is the residence of a Greek archbishop, and gives name to the gulph which runs between the coast of the Morea, and the island of *Cephalonia*.

The currants of *Patras* are esteemed the best in those parts; but there are no great quantities of them. The trade of the inhabitants chiefly consists of raw silk, made in great quantities in the Morea. Leather is also cheap, as are also honey, wax, wood, and cheese.

Braccio di Mania, or *Takonia*, comprehends the ancient *Arcadia* and *Laconia*, and contains the following places, viz.

Mistira, the ancient *Sparta*, is situated on the river *Eurotas*, now called *Basilopotamus*. It consists of a castle, the city properly so called, and below it two large suburbs. The town and castle have each their distinct walls. The former is advantageously situated on the top of a mountain, and its walls are strong and kept in good repair. It is defended by eight or ten pieces of ordnance, and the whole garrison consists of eighteen or twenty janizaries, commanded by a governor, who seldom resides in the castle. The Turks imagine, that it can only be taken by famine, and have therefore provided it with magazines constantly filled with corn. Within the place are also cisterns kept full of water.

The town stands at the foot of the castle, which covers it to the north, and consists of two spacious streets, and several narrow lanes crossing them. The old market-place

place has a curious fountain, which throws up water from three brazen pipes, and near it is a church built out of the ruins of Minerva's temple. There are also the remains of four magnificent marble buildings, the Persian gallery, or portico, erected in memory of the victory gained by the Greeks at the battle of Platæa, the temple of Helena, the temple of Hercules, and that of Venus. In the town stands also the cathedral, which is a very noble building. The roof is supported by marble pillars; it has seven domes, and the pavement is a curious piece of Mosaic work. This is the see of a Greek archbishop, who is stiled metropolitan, and has a handsome and commodious palace, in which are lodgings for ten or twelve coloyers, or monks, who are dignitaries of the cathedral.

Towards the south-east part of the town is a convent of nuns, whose church, though not so large, is more beautiful than the cathedral. In one of the suburbs is another church, far more magnificent than the two already mentioned. The inside is adorned with very fine paintings; the marble of its columns is very beautiful, and adorned with the most curious workmanship, and both the portico and the domes are admirable. In each of these churches is a particular inclosure, within which the Greek women are placed separate from the men. In the same suburb stands the finest mosque the Turks have at Mistræ; it was built out of the ruins of antient Sparta. The domes are extremely noble, and its minarets most curiously wrought. Adjoining to it is the best endowed hospital of any in Turkey; provisions are there daily distributed to the poor, and extraordinary care is taken of the sick; and both Jews, Moors, Turks, and Christians are equally welcome. There are also at Mistræ two hans, or caravanseras, for travellers; both of which are fine buildings, particularly the new one, where there are chambers for the merchants, with stables underneath for their horses and other beasts of burthen.

They reckon near two thousand houses at Mistræ, and near as many in the above suburb; but the latter are by far the finest, and therefore the most considerable of the Turks live there; where they have pleasant gardens. The other village contains about a thousand houses, most of them inhabited by Jews, who have a synagogue there, as they have also at Mistræ and in the other village; the Sadducees have also particular synagogues and burying-places, and never intermarry with the other Jews.

The city of Malvesia, by the modern Greeks called Monembasia, and by the Turks Menewtsche, is seated on a little island, on the eastern coast of the Morea, near the mouth of the gulph of Neapoli, thirty-nine miles to the south-east of Mistræ. The island on which it stands is not above a pistol-shot from the continent, and is joined to it by a handsome stone bridge. The town is built at the foot of a steep rock, on the top of which is a good fortress. The walls of the city are towards the sea-shore, and in very good repair; those of the fortress are very indifferent; but its situation renders it in a manner impregnable, there being no ascent to it but by a very dangerous path. It has a pretty good harbour, and is the see of a Greek bishop.

The island on which the city is built is planted with fine gardens and vineyards, which produce that excellent wine called malmsey: but, as the island is small, it cannot produce a sufficient quantity of it to answer the demands of the public; they have therefore planted on the opposite shore a space of ground about eight leagues in extent, with vines from this island; the wine they produce is generally sold for malmsey, and is little inferior to it.

Maina is a town with a district belonging to it on the south part of the island. Its inhabitants, and those in the neighbourhood called Mainotti, are the descendants of the antient Lacedæmonians, and are still distinguished as the bravest of all the Greeks. Though their whole military force is said not to exceed ten thousand men, they have never been conquered, nor even rendered tributary to the Turks. Their country is on all sides surrounded with mountains. Their modern name is derived from *μδνία*, or madness, from their custom of rushing upon the enemy, as if actuated by a phrenzy.

The fourth district is Sacconia, or Romania Minor, which contains the antient cities of Corinth, Sicyon, and Argos.

Corinth, first called Ephyra, and now by the Turks Gerame, was built at the foot of a very high rock, on which stands a castle, that has a most beautiful prospect on every side. It was antiently one of the finest cities of all Greece, and abounded in magnificent buildings, such as temples, palaces, amphitheatres, monuments, baths, and other works, adorned with statues by the greatest masters, and beautiful porticos of columns, whose singular decorations and elegant capitals gave rise to the appellation of the Corinthian order. But these superb edifices are demolished, and all this magnificence buried in the dust; and the spot on which Corinth stood being filled up with fields and gardens, it rather resembles a village than a city. The buildings are not contiguous, but in clusters of half a dozen, ten, or sometimes twenty together, but seldom more, with gardens of orange, lemon, and cypress trees about them. This town has two mosques, and is still the see of a Greek archbishop, who lives in the cathedral, which is the only church here.

Nemea, a village famed for the antient Nemæan games, celebrated in honour of Hercules.

Sicyon, now called Basilica, was once a very considerable city, the capital of the antient kingdom of Sicyona, which stood upon a hill by the river Asopus, about eight miles to the west of Corinth; but is now only a heap of ruins.

Argos, a mean place on the river Najo, or Inachus, formerly a splendid capital, is the see of a bishop, and is defended by a citadel.

Mycene, a village, once the capital of a kingdom.

Napoli di Romania, in Latin Neapolis, was antiently called Nauplia. It stands on the top of a small promontory, thirty-six miles to the south of Corinth. The port, which is one of the best in the Morea, is secured against pirates by a little castle built on a rock, that defends the entrance into the harbour; which is so narrow, that only one galley can pass at a time, though the harbour is so spacious as to be able to contain a large fleet. There is but one avenue, and only one gate to get into the town on the land side; every where else the sea washes the walls, which are pretty strong, and flanked with old towers. Besides the above-mentioned castle, there is another on the north side. As the harbour is more secure, and has better anchorage than any other on the west coast, the inhabitants carry on a considerable trade in corn, wine, oil, silks, cotton, and tobacco. The city is inhabited by Christians, Turks, and Jews, and is the see of an archbishop.

SECT. VIII.

Of LIVADIA, or GREECE PROPER.

Its Situation, Extent, Mountains, Rivers, with an Account of the most remarkable Places now in that Country.

UNDER the name of Livadia is at present comprized antient Greece, properly so called, to which belonged the little kingdoms of Acarnania, Ætolia, Ozolæa, Locris, Phocis, Doris, Epicnemedia, Bœotia, Megara, and Attica. This province reaches from the Ionian sea to the Archipelago, and is bounded on the north by Epirus, now the streight of Negropont, and by Thessaly, now called Janna; on the east by the Archipelago; on the south by the gulph of Engia, or Egina, the isthmus of Corinth, and the gulph of Lepanto; and on the west by the Ionian sea, and part of Albania.

It is a pleasant and fruitful country, extending about a hundred and thirty miles from the south-east to the north-west, and is for the most part mountainous, containing Mount Oeta, in Bœotia, famous for the pass of Thermopyle, which was not above twenty-five feet broad, and derived its name from the warm baths in its neighbourhood; and for Mount Parnassus, sacred to Apollo; with Mount Helicon and Cytheron, consecrated to the Muses; all of them celebrated by the poets.

Temple of Minerva.

Hadrian's Aqueduct.

The principal rivers of this country are the Sionapro, the antient Achelous, which separated the Arcanians from the Ætolians; the Cephissus, that falls into the lake of Copai, which it properly forms; and the Ismenus, which probably ran into the Asopus, a river that discharges itself into the Archipelago.

The following places are at present the most remarkable:

Lepanto, the antient Naupactus, a town on a mountain that runs along the shore of the gulph of Lepanto, formerly termed the gulph of Corinth. On the summit of the mountain stands a small castle. The town is surrounded by a fertile country, covered with olive trees and vineyards, corn-fields, and plantations of oranges, lemons, and citrons.

The Dardanel, are two castles that defend the entrance of the gulph of Lepanto. Here the Venetians, in the year 1571, gained a most signal victory over the Turkish fleet.

Castri, the antient Delphi, or Delphos, is situated two Turkish miles to the north of the gulph of Lepanto, and stands on a bare mountain. It was antiently very famous for its temple and oracle of Apollo; but is now only a poor place, consisting of about two hundred houses.

Livadia, the capital of the province to which it gives name, is situated twenty-two miles to the north of the isthmus of Corinth, and built round a mountain which, terminates in a peak, on the top of which is an old castle. The river Hercyna rises out of the mountain by the castle with such a plentiful stream, that it turns a considerable number of mills in its passage through the town. This place is large and populous; it is inhabited by many rich Turks, who are here more numerous than the Christians, and have fine mosques. The Christians have four or five old ruinous churches; but there are but few Jews. The city is governed by a vaivode and a cady, and carries on a pretty good trade in woollen stuffs and rice. This town was antiently celebrated for the oracle of Tryphonius, which was in a cave in the hill above the town.

The lake of Livadia is five or six miles to the east of the city, on the north side of a large plain, entirely encompassed with high hills.

Megara, antiently the seat of a monarch, and afterwards the capital of a republic, so formidable as to be able to carry on a war against the Athenians and others, and to plant a colony in Sicily, is now but a poor village, and consists of about three or four hundred pitiful cottages, inhabited only by Christians, who get their living chiefly by tilling the earth, for which they have half the crop, the rest being paid to their Turkish landlords. They also make pitch, and saw boards and planks, out of the pines and firs that grow in great abundance on the neighbouring mountains.

Salona is seated upon a rock in the inmost recess of a fruitful valley, under an high mountain which rises to the northward, about twelve miles to the north-west of Livadia. It is defended by a castle on the top of the rock, and is a bishopric subject to the metropolitan of Athens. The number of Christians and Turks are about equal, the former having six churches, and the latter seven mosques; but no Jews are permitted here. The trade consists in some cotton, but chiefly in tobacco.

Athens, now Setines, the ancient capital of Attica, was at first called Cecropia, from Cecrops its founder; but afterwards was known by the name of Athens, which is derived from the goddess Minerva. Exclusive of its power, amazing grandeur, and opulence, it was highly celebrated for being the nursery of the most eminent philosophers, statesmen, orators, and great commanders. It was at first governed by kings, then by archons, but afterwards fell successively under the power of the Persians, Macedonians, and Romans. In later times it came under the dominion of the Turks, from whom it was taken by the Venetians. In the year 1455 the Turks retook it. In 1687 the Venetians again recovered it; but in the last wars between those two powers, it again fell into the hands of the Turks.

This city, once justly celebrated for the magnificence of its buildings, has no walls; but the avenues to it be-

ing shut by gates, are a sufficient security against the corsairs, which sometimes frequent the coast. The houses are built close together, and the streets are very narrow. The town, which is defended by a citadel, is divided into eight quarters. The inhabitants are computed to amount to about eight or ten thousand, three parts of whom are Christians, and the rest Turks; for no Jews are permitted to live amongst them. It is the see of an archbishop, whose revenue amounts to four hundred thousand dollars a year. There are said to be two hundred churches and little chapels in and about Athens, fifty-two of which have their peculiar priests; the rest are seldom used, except on the days of their founders, and are indeed only little oratories. The catholicon, or cathedral, is the best kept in repair, and the best adorned of any of them; but in reality is but a mean building, and, in point of magnificence, exceeds very few of the ordinary parish churches in England. Here are also several convents of monks and nuns. The Turks have five mosques; one in the castle was the Parthenion, or the stately temple of Minerva, and is now accounted the finest piece of antiquity in the whole world; but in the last Venetian war this building suffered much by the cannon.

The Acropolis, which is the citadel above-mentioned, is situated upon the summit of a rock, in a very considerable elevation above the circumjacent plains. The top of this rock is flat, and about three quarters of a mile in circumference, to which there is an almost perpendicular ascent on all sides, except to the north-west. Its figure is an oblong square, and it is flanked all round with a tolerable good wall. This fortress might be rendered almost impregnable. Besides the temple of Minerva, now a mosque, there is on the south side of the castle the theatre of Bacchus; the magnificent pillars, gate, and aqueduct of the emperor Adrian; the stadium, where the public games, called panathenæa, were exercised; the ruins of the areopagus; the odeum, or music-theatre; the temples of Theseus, Augustus, and Jupiter Olympius; the temple of the winds; the Pharos, or lantern of Demosthenes: all these are still to be seen, either entire or in part.

The two rivers, Ilissus and Eridanus, that water the plain in which Athens now stands, are very small; the former being diverted into several canals for watering the olive yards, and the latter lost amidst the many branches into which it is conveyed over the country. Athens had antiently three harbours, of which those named Phalareus and Munichia lay to the eastward, and Piræus to the west of a small cape. The latter being an inclosed spacious harbour, with a narrow entrance, is still much resorted to, and by the Greeks called Porto Drago, but by the Italians Porto Leone, from a pillar there in memory of a lion which was carried from thence to Venice.

Lepina, the antient Eleusis, now lies in ruins, and is in a manner destitute of inhabitants; but the remains of the magnificent temple of Ceres still invite travellers to visit this place, there being visible marks of a most superb structure, all of very fine white marble, adorned with excellent carvings and statues.

Stibes, or Stives, the antient Thebes, distinguished for its sumptuous temples, palaces, and other noble structures, has at present no remains of its antient grandeur, except its being the see of a bishop. Its present walls seem very antient, and it has a castle of an oval figure. It is said to contain three or four thousand souls. The Turks, who appear to be the least part of the inhabitants, have two mosques, and the Christians several churches.

S E C T. VIII.

Of JANNA, the antient THESSALY.

Its Situation, Extent, Mountains, Rivers, Fertility, and principal Towns.

THIS country derived its antient name from king Thessalus, and is bounded on the north by Macedonia, on the west by Epirus, on the south by Livadia, and on the east by the Ægean sea and the gulph of Salonica, extending about a hundred miles where longest, from east to west, and its greatest breadth from north to south, ninety. It was sometimes annexed to Macedonia,

sometimes divided from it, and then united to it again.

Among its once celebrated twenty-four mountains the most remarkable is Olympus, now called Lacha, which, from its uncommon height, was celebrated by the ancients as the residence of the gods; for they supposed it to reach up to heaven, though it is not much above an English mile in perpendicular height. Mount Ossa, together with Nephele, was, according to the fabulous accounts of antiquity, inhabited by the Centaurs, whom Hercules slew or drove out. Here also are situated the plains of Pharfalia, and between the mountains Olympus, Pelion, and Ossa, is the delightful valley of Tempe, which was so adorned with the gifts of nature, and so delightfully watered by the gently winding streams of the transparent Peneus, now the Salampria, that it was esteemed the garden of the muses.

The principal rivers in Thessaly are the Salambria, or Selampria, the Peneus of the ancients. It springs from the mountains that divide Epirus from Thessaly, runs across the latter from east to west, and, having watered the cities of Janna and Larissa, discharges itself into the gulph of Salonichi. Besides this, there is no other river worthy of notice but the Agriomela, called by the ancients the Sperchius, which springs from Mount Pindus, now Mezzovo, runs eastward through Thessaly, and falls into the gulph of Zeyton.

This country, in its amazing fertility, seems to exceed all other parts of Greece. It produces citrons, oranges, lemons, pomegranates, grapes of an uncommon sweetness, excellent figs and melons, almonds, olives, chestnuts, cotton, and all sorts of grain. It was antiently famous for its breed of cattle and horses, from which, and the extraordinary skill of the Thessalians in horsemanship, the fable of the Centaurs is supposed to take its rise.

The most remarkable towns in this country are,

Larissa, or Larso, by the Turks called Jengishair, the capital, stands on the river Pineus, in a hilly and delightful part of the country. It is seated on a rising ground, with a large plain on the south, and Mount Olympus on the north. Over the river is a handsome stone bridge of nine arches; but the town has lost much of its antient grandeur, though it is still one of the most powerful cities in Greece. It is the see of a Greek archbishop, and yet the Christians are said to have but one church here. There are above two hundred Jewish families, most of them very rich, and a considerable trade is carried on, particularly in leather.

Tornovo is a spacious and pleasant city, in which are eighteen Greek churches, and three Turkish mosques. The present bishop is under the archbishop of Larissa.

Janna, or Jannina, from which the country receives its name, is seated in a little island formed by the river Peneus. It is inhabited by rich Greek merchants.

Zeyton stands on the bay of the same name, fifty miles to the south of Larissa, and was formerly defended by two large castles. Before the city is a beautiful and fertile plain, which abounds with corn-fields, kitchen-gardens, and orchards; and is surrounded by several villages, which, together with the many windings of the river Agriomela, afford a most delightful prospect. The city is inhabited both by Christians and Turks.

Armira, a town on the gulph of the same name, thought to be the Eretria of the ancients.

SECT. IX.

Of MACEDONIA.

Its Situation, Climate, Soil, Gulphs, Rivers, and Mountains; with a particular Description of Mount Athos and its Inhabitants, and of the principal Towns in Macedonia; particularly Salonichi, the antient Thessalonica, and Philippi.

MACEDONIA is of a very irregular figure; it is bounded on the north by Servia and Bulgaria, on the east by the Archipelago and Romania, on the south by Thessaly and Epirus, and on the west by Albania.

Its situation is advantageous, and the air clear, sharp, and wholesome. The soil is for the most part fertile,

particularly on the maritime coasts, which abound in corn, wine, oil, and whatever can be desired for use and pleasure; but in the inland parts are several uninhabited wastes. It had formerly mines of almost all kinds of metals, particularly gold. Here is great plenty of wood, and all kinds of timber; and its many fine bays are of great advantage to trade. The most remarkable of these are the Contessa, or the Sinus Strymonicus, Monte Santo, or the Sinus Singiticus, and the Salonichi, or the Sinus Thermæus.

The principal rivers are the Platamone, the antient Aliacmon, which runs into the bay of Salonichi; the Vistritza, the antient Erigon, which runs into the Vardar, the antient Axios, the greatest river in all Macedonia; and the Strymon, which rises in Romania, or Thrace, and discharges itself into the gulph of Contessa.

Among the many large mountains in this country is the chain of the Scardi, which traverses the northern part of it. Pangæus, formerly famed for its rich gold and silver mines. The mountain of Hæmus joins the Scardi, separating this country from Romania. Mount Athos is one of the most celebrated mountains in the whole world, and therefore deserves a particular description, which we shall give from that accurate geographer Dr. Busching.

Mount Athos, commonly called Monto Santo, lies on a peninsula which extends into the Ægean sea, and is indeed a chain of mountains, reaching the whole length of the peninsula, seven Turkish miles in length, and three in breadth; but it is only a single mountain that is properly called Athos. Its uncommon height appears from the accounts of Pliny and Plutarch, who affirm, that when the sun is at the summer solstice, probably a little before its setting, the mountain casts its shadow as far as the market-place of Myrrhina, in the isle of Lemnos, which, in the best maps, is fifty-five Italian miles distant; whence the height of Mount Athos may be inferred to be about eleven stadia.

It is evident from Ælian, that antiently the mountain in general, and particularly the summit, was accounted very healthy, and conducive to long life; whence the inhabitants were called Macrobii, or long lived. We are farther informed by Philostratus, in the life of Apollonius, that numbers of philosophers used to retire to this mountain for the better contemplation of the heavens, and of nature; and after their example the monks doubtless built their cells.

On it are twenty-two convents, besides a great number of cells and grottos, with the habitations of no less than six thousand monks and hermits; though the proper hermits, who live in grottos, are not above twenty: the other monks are anchorites, or such as live in cells.

These Greek monks, who call themselves the inhabitants of the holy mountain, are so far from being a set of slothful people, that, besides their daily offices of religion, they perform all manner of work, cultivate the olive and vineyards, are carpenters, masons, stone-cutters, cloth-workers, taylors, &c. They also live a very austere life; their usual food, instead of flesh, being vegetables, dried olives, figs, and other fruit, onions, cheese, and on certain days, Lent excepted, fish. Their fasts are many and severe, which, with the healthfulness of the air, renders longevity so common there, that many of them live above a hundred years.

In every convent are two or three studying monks, who are exempted from labour; but use exemplary diligence among the many writings to be found in their libraries; these are highly esteemed for the orthodoxy of their doctrines, and the sanctity of their lives; and here it is that the Greeks properly and chiefly learn their divinity. These convents and churches have bells, which are no where else allowed the Greeks; and are also surrounded with high and strong walls, planted with cannon, as a security from any surprize from Corsairs.

Besides churches and monasteries, the mountain has also a town called Kareis, inhabited by monks, and the residence of a Turkish aga, who commands here in the name of the bostangi basha, to defend the place against the corsairs, it being under the protection of that basha, to whom it annually pays twelve thousand dollars, and near

near as much more is paid at Salonichi for the use of the sultan. This heavy tribute is discharged by alms, and the liberal contributions of Russia, and the princes of Walachia and Moldavia. In this town a market is held every Saturday among the monks and anchorites, which last bring hither knives and little pictures of saints, and with the money they thus earn, they purchase bread; but the monks carry them about every where, and receive alms for them. No fowls or cattle are kept by the inhabitants of this mountain; but graziers on paying a consideration are allowed to fatten their cattle there. On this chain of hills formerly stood five cities.

The principal towns of Macedonia are Salonichi, the ancient Thessalonica, a celebrated trading city in the bay of the same name, and at present the most considerable city in Macedonia. It was once called Halia, and Therma; but Cassander rebuilt it, and in honour of his wife Thessalonica, the sister of Alexander the Great, gave it her name. To its admirable situation for trade is probably owing the regard which the several conquerors of Macedonia have shewn it. The advantages derived from it are such as are scarcely to be met with elsewhere; and as it attracted the encomiums of the ancients, so it has the admiration of the moderns.

This city, which is situated in twelve degrees twenty-three minutes east longitude from London, and in forty degrees forty minutes latitude, is one hundred and sixty miles to the north-west of the isthmus of Corinth, and stands partly on a hill, and partly on its declivity. In its neighbourhood runs the river Vardar, which abounds with fish, and its banks are adorned with beautiful trees. The city is said to be ten miles in compass; its walls are flanked with several towers, and it is defended by three castles: the first, which is the smallest, stands where people land from the sea, at some distance from the walls, and is furnished with twenty pieces of ordnance. The two others are within sight of the sea, on the highest parts of the wall, and are provided with forty heavy cannon. On the land-side is a fortress which commands the city, it being seated on a hill, at the foot of which is a large suburb encompassed by its own walls; but yet contiguous to the town. It is extremely populous; but most of those houses in the plain are too low, and hardly sufficient for the great number of Jews who inhabit them; nor are they less inconvenient on account of the offensive smell caused by the narrowness of the streets. In this city a great quantity of silk, wool, leather of all sorts, wax, powder, grain, cotton, and iron are continually worked. The trade is chiefly managed by the Jews, who have the monopoly of the manufactures of all the stuffs made for the use of the janizaries. The Jews have thirty-six large synagogues here, besides several small ones; and two colleges, to which youth flock from all parts to study. The Greeks have thirty churches, and the Turks forty-eight mosques, among which is one that was formerly a christian church, dedicated to St. Demetrius. This is distinguished by its beauty and magnificence, it consisting of one church built over another, and having in it above a thousand columns of marble, jasper and, porphyry. Among other stately remains of the ancient grandeur of this city are triumphal arches, one of which is almost entire, erected in honour of the emperor Antoninus, and without the city are a great number of antique fragments with inscriptions. Numbers of coins too are also found here.

This city is the residence of a Turkish basha, and likewise of a Greek archbishop, who has eight suffragans under him. The Christians were formerly so considerable, that St. Paul addressed two of his epistles to them. In the year 1313, the city was sold to the Venetians; but they were dispossessed of it about eight years after by Amurath II.

Philippi now an inconsiderable village, seventy miles to the north-east of Salonichi, stood on a hill betwixt the rivers Nessus and Strymon, on the borders of Thrace, to which in its most ancient times it belonged. It was at first called Crenides, or Spring-town, from the many springs issuing from the hill on which it stood; afterwards Dasos or Thasus, from the Thasii who built it,

and lastly Philippi, from Philip of Macedon, who, after reducing it, rebuilt it with considerable improvements; and from thenceforward it belonged to Macedonia. Near this place Brutus and Cassius were defeated by Octavius and Mark Antony. Under Julius Cæsar and Augustus it was a Roman colony. Here the apostle Paul preached, and wrote one of his epistles to the Christians of this city.

On approaching the place you first see the castle seated on the hill; it is very large, and its walls almost entire. On the several hills that surround the castle stand several other fortresses, which have a communication with it, encompassed by large walls that extend into the plain. Within the place are heaps of free-stone, and pieces of marble, but no footsteps of any buildings. Farther up you see a great number of edifices half demolished. It is easily perceived that there were here magnificent temples built of white marble, and noble palaces, the broken remains of which give the beholder the highest idea of the beauty of the ancient architecture. There are, however, only a few houses near the ruins of this celebrated city; and its inhabitants consist of a small number of poor Greeks, notwithstanding which it is the residence of a Grecian bishop, who styles himself metropolitan of Philippi and Drama.

Contessa is a small town twenty miles distant from the ruins of Philippi, and gives name to the gulph into which the river Strymon runs.

Cavalla is situated also on the same gulph between Contessa and Philippi. Its castle is still entire; but what appears more remarkable is, there being still in the neighbouring mountains long and thick walls, and several fortifications, which were probably built for the defence of the city. The walls extend to the top of the highest mountains, and seem to have been designed for shutting up the passes. There are at Cavalla the remains of an aqueduct, with a double row of arches, one over the other, which served to convey water into the city and castle. This place has some trade, and also gives its name to the gulph, which is sometimes called the gulph of Cavalla.

Emboli, the ancient Amphipolis, is seated upon the river Strymon, about six miles above its mouth, and was once famous as an Athenian colony; but is now a very inconsiderable place.

Pirlipe, a town situated among high mountains, which glitter like silver, and besides talc, abound also in metals and minerals.

S E C T. X.

Of ROMANIA, by the Turks called RUMILI.

Its Name, Situation, Mountains, Rivers, and Climate, with an Account of the principal Towns, and a particular Description of Adrianople.

THIS country, which received the name of Romania, either from the Romans, or from New Rome, or Constantinople, the seat of the eastern part of the Roman empire, is the ancient Thrace so often mentioned by the Greek and Roman historians. It is a spacious country, bounded on the north by mount Hæmus; on the east by the Red-Sea, the Hellespont, and Propontis, or Sea of Marmora; on the south by the Archipelago; and on the west by Macedonia, and the river Strymon.

It is situated between the thirty-ninth and forty-third degrees of latitude, and its utmost extent from the south-east to the north-west, that is from the city of Constantinople to the extremity of Macedonia, is about two hundred and eighty miles, and its breadth from north to south one hundred and eighty.

The country is mostly level, though interspersed with some large and remarkable mountains, the most considerable of which is mount Hæmus, which on the north separates Rumili from Bulgaria. The next in bigness is Rhodope, celebrated by the ancient poets for the catastrophe of Orpheus. Mount Pangæus separates this country from Macedonia, and Orbelus lies at no great distance from the river Nessus. Hæmus and Rhodope

dope are two long ridges of mountains, that extend from the frontiers of Macedonia to the Black-Sea.

The rivers worthy of notice are,

The Maritz, called by the ancients the Hebrus, which rises in mount Hæmus, and traversing Romania, falls into the *Ægean* sea. The Carasu, Mestro, or Nessus, rises in mount Rhodope, from whence it discharges itself into the *Ægean* sea; and the Strymon which rises in mount Pangæus, and also falls into the *Ægean* Sea.

The territories situated among the mountains are cold and barren; but those nearer the sea are pleasant and fertile, producing all kinds of grain, and other necessaries, particularly rice, which grows there in great plenty, and is remarkably good.

The country was anciently divided into many independent kingdoms; but the present inhabitants are Greeks, descended from the ancient Thracians, with a mixture of Turks. The flourishing state of the sciences and polite arts was chiefly owing to the Thracians; but at present there is scarce a person of any remarkable eminence in literature in all Romania.

The country is divided into three fangiackships, and is therefore governed by three fangiacks.

The fangiackship of Kirkeli lies to the north, near Mount Hæmus, and contains, among others, the following places:

Basartshick, a considerable town seated on the river Maritz, into which falls at this place another stream, which runs round the town. It is delightfully situated, and universally well built; the streets are broad and clean, and its inhabitants carry on a great trade.

Philippopoli, a very antient city, first founded by Philip, the father of Alexander the Great, from whom it received its name, is still a pretty large town. It is built on three little hills, which in a manner join. Upon one of these hills stands a quadrangular tower, which was once a fortification, but at present is only used for a watch tower. The Maritz, which begins here to be navigable, separates the town from the lower suburb, which is joined to the town by a good wooden bridge. There are here about a hundred and twenty Jewish families; but most of the citizens are Greeks, who have six churches, and it is the residence of a Greek archbishop.

Mustapha Basha Kiuperi, a town which takes its name from a very beautiful bridge erected there over the Maritz, by Mustapha Basha. This bridge consists of twenty arches, all of free-stone, and is said to have cost four hundred purses, or two hundred thousand rix-dollars.

The fangiackship of Byzia extends from the foot of Mount Hæmus to the sea of Marmora, and contains the following places:

Adrianople, called by the Turks Edrene, takes its name from Adrian, who founded or restored it. In the year 1360 sultan Amurath I. took it from the Christians, from which time it became the seat of the Turkish emperors, till they took Constantinople. It is of a circular form, surrounded with a wall and towers, and is said to be eight miles in compass. It has good houses, but narrow and unequal streets. The seraglio stands in a most delightful situation, the country all round being very beautiful; but the air is bad, and the river Maritz, on which it is situated, being dried up every summer, greatly contributes to render it unwholesome: but during the rest of the year it is a very pleasant stream, over which are two noble bridges. The bazar, or exchange, founded by Ali Basha, extends half a mile in length; the roof is arched, and kept extremely neat. It holds three hundred and sixty-five shops, furnished with all sorts of rich goods, which are exposed to sale in the same manner as in Exeter Exchange, in London. The pavement is kept remarkably neat, and the shops as clean as if just painted. Idle people of all sorts walk here for their diversion, or amuse themselves with drinking coffee or sherbet, which are cried about as oranges and apples are in our play-houses. Most of the rich tradesmen here are Jews. Near it is the Sherki, a narrow street a mile in length, covered on the top with boards to keep out the rain, that merchants may meet conveniently in all weathers. The Besisten near it is another exchange,

built upon pillars, where all sorts of horse furniture is sold, and is seen every where glittering with gold, rich embroidery, and jewels, especially when the court is there.

The mosque of Sultan Selim I. is a building well worth the curiosity of a traveller. It is advantageously situated in the midst of the city, and in the highest part of it, whence it is seen on every side to great advantage. The first court has four gates, and the innermost three. They are both of them surrounded with cloisters, with marble columns of the Ionic order, finely polished, and of very lively colours. The whole pavement is of white marble, and the roof of the cloisters divided into several cupolas, or domes, headed with gilt balls on the top. In the midst of each court are fountains of white marble; and before the great gate of the mosque is a portico, with columns of green marble, and five gates. The mosque is covered by one prodigious dome of a vast height.

The lady Wortley Montague, who has given the only intelligible and consistent description of this mosque, and was perhaps the only Christian that ever entered it, says, she thought it the noblest building she ever saw. On the inside it has two rows of galleries, supported by columns of red and white marble, with marble balustrades; the pavement is also marble, covered with Persian carpets. The walls are encrusted with Japan china, in flowers of the most lively colours. In the middle of this structure hangs a vast lamp of silver gilt, and about two thousand of a smaller size, which must have a glorious effect when all are lighted. Under the large lamp is a great pulpit of carved wood gilt, and just by it a fountain to wash. In one corner is a little gallery enclosed with gilded lattices for the sultan; and at the upper end is a large niche, very like an altar, raised two steps, and covered with gold brocade. Before it stands two silver gilt candlesticks the height of a man, and in them were wax candles as thick as a man's waist.

The outside of the mosque is adorned with towers of a prodigious height, gilt on the top, from whence the imaums call the people to prayers. To each of these towers there is but one door, which leads to three different stair-cases, rising to the three different stories of the tower, in such a manner that three priests may ascend, rounding, and descend, without meeting each other; a contrivance very much admired.

Behind the mosque is another exchange full of shops, where poor artificers are lodged gratis.

There are some other mosques built much after the same manner, but not comparable in point of magnificence, to that just described.

Selivrea, the antient Selimbria, is a celebrated port on the sea of Marmora. It has an old ruinous castle, which stands on an eminence, and was formerly very strong. The town is neatly built, and has a bridge of thirty-two arches. In the suburbs is an imperial granary, into which the grain of the province is brought. Here is a famous antient Greek church; but it is an ill built edifice, set out with the same sort of ornaments as the Romish churches, but these are less rich. They here pretend to shew a saint's body, and a picture of the Virgin Mary, drawn by the hand of St. Luke, very little to the credit of his painting; but no picture among the papists is more famous for its miracles. The Greeks have indeed a monstrous taste in their paintings, which, for more finery, are always done upon a gold ground; and they have no notion of either shade or proportion. This town is the see of a bishop.

Heraclea, antiently Perinthus, was formerly a large city; though now it is but a mean palace. It has a good harbour, and is the residence of an archbishop. Here are abundance of fragments of statues, entablatures, columns, and there are still to be seen the remains of an amphitheatre built in the time of the emperor Severus.

Rodoso is a large and populous trading town, lying on the sea of Marmora. It is situated upon the brow of a hill, at the bottom of a bay, and makes a handsome appearance towards the sea.

Belgrade, a village near Constantinople, situated in the midst of a wood, consisting chiefly of fruit-trees, watered by a great number of fountains, famous for the excellence

of their water, and divided into many shady walks, with-in view of the Black sea, from whence a cool breeze perpetually arises that make the inhabitants insensible of the heat of summer. This village is only inhabited by the richest among the Christians.

We might here give a description of Constantinople, which is situated in this sangiacship; but, as that will take up a considerable length, we choose to defer it till the next section.

The third sangiacship is that of Gallipoli, which extends from Mount Rhodope to the Archipelago. To it belongs,

Trajanopolis, antiently called Zernis, but being repaired and beautified by the emperor Trajan, about the end of the first century, was called by his name. It is still the see of a bishop, though the town is but small, and very thinly peopled.

Demetia, a town on the Maritz, the residence of a Greek bishop. Here Charles XII. king of Sweden, spent some time in the year 1713.

The Thracian Chersonesus, which is in this division, is a peninsula washed on the eastward by the sea of Marmora and the Hellespont, on the south by the Archipelago, on the westward by a gulph into which falls the small river of Melas, and on the north it is joined to the continent by a tract of land, the breadth of which was reckoned by the antients to be about thirty-seven stadia. It formerly contained eleven towns, but at present the following are the principal of note:

Gallipoli, the antient Callipolis, was built by Callias, prince of the Athenians, from whom it received its name, and is still a large town, situated on the celebrated strait by the antients called the Hellespont, which divides Europe from Asia, and is said to contain ten thousand Turks, three thousand five hundred Greeks, and not quite so many Jews. The inhabitants are famed for making excellent arrows. The Bazar is a handsome building, with several domes covered with lead. The town has no walls, and is only defended by a castle and an old tower.

At the entrance of this strait, next the Archipelago, are the celebrated Dardanells, two castles which command the whole strait, and are the key of Constantinople. One of them stands in Europe, on the most southern point of the Thracian Chersonesus, where the straits begin, and the other opposite to it in Asia. That in Europe only consists of one round tower, with some out-works; close to which stands a village. Both these castles were built by Mahomet II. in 1452; but, in the year 1656, the Venetian fleet forced their way through, and drove the Turkish fleet ashore. On a rock in the middle of this strait stands a tower, on which the Turks have some small cannon; this serves the mariners as a mark to steer by, and is only used by the Turks as a watch-tower. "Since I have seen this strait, says the ingenious lady Wortley Montague, I see nothing improbable in the adventure of Leonidas, or very wonderful in the bridge of boats of Xerxes. 'Tis so narrow, 'tis not surprising a young lover should attempt to swim, or an ambitious king try to pass his army over it. But then 'tis so subject to storms, 'tis no wonder the lover perished, and the bridge was broken."

S E C T. XI.

Of the Names and Situation of Constantinople; with a concise History of that City: its agreeable Climate, and a Description of its principal Buildings.

THE city of Constantinople, the antient Byzantium, by the Turks called Istambul, the capital of the Turkish empire, is situated on the most eastern part of Romania, on a neck of land which projects towards Nattolia, from which it is separated by a strait about a mile broad. It stands in the forty-first degree of latitude, and the twenty-eighth degree forty minutes east longitude from London; and is also called the sublime Porte, the sublime sultanian Porte, the Port of justice, majesty, and felicity. The appellation of Porte is said to be derived from the large and magnificent port or gate built by Ma-

homet II. at the principal entrance of the seraglio, or imperial palace.

The antient Byzantium was built by Pausanias, king of Sparta, but afterwards becoming subject to the Romans, it was demolished by the emperor Severus, in order to punish the rebellion of the inhabitants. It was, however, afterwards rebuilt by Constantine the Great, who called it New Rome, and removed the seat of the empire thither; but afterwards called it Constantinople, from his own name.

This city, after being the capital of the Eastern empire almost three hundred years, was first besieged in the reign of the emperor Phocas by Chozroes, king of Persia, who blocked it up for eight years together, till it was delivered by Heraclius in the year 611, who on this account obtained the empire.

In 672 it was besieged in the reign of the emperor Constantine Pogonates by Yefid, the son of Moavia, the first caliph of the family of the Ommiades; when the Greek emperor was so pressed, as to be almost reduced to despair; for while the Saracen army lay before it on the land side, they blocked it up with a prodigious fleet at sea. But Callinicus, a famous engineer, invented a kind of wild-fire, that would burn under water, and by this means is said to have destroyed the whole fleet.

In 717 this city was again besieged by Moslemah, the brother of Solyman; but was relieved by Leo the Isaurian, who caused the emperor to be shaven and confined in a cloister, and then seated himself on the throne.

In 780 Haroun Alraschid, son of the caliph Matradi, invested Constantinople with a prodigious army, when the Greek empire being governed by Irene, as regent to her son Constantine VI. surnamed Porphyrogenetes, she was so hard pressed, as to be glad to deliver herself by a treaty, in which she promised to pay an annual tribute of seventy thousand pieces of gold to the caliph. Thus this part of the Roman empire became tributary to the Saracens.

The Greek empire now began to decline, and that of the Mahometans had greatly increased, when crusades, produced by bigotry, began to be formed, under the pretence of recovering the Holy Land. These crusaders committed the greatest barbarities in the Eastern empire; and in one of these expeditions Baldwin, earl of Flanders, in the year 1204, surprised Constantinople, notwithstanding its being a Christian city, and caused himself to be proclaimed emperor of the East; but dying in less than a year, he was succeeded by his brother Henry, earl of Flanders, who held the government ten years; and, at his death, Peter Courteney, of that noble family, which still subsists in England, having married his daughter, succeeded to the throne; but was killed in the sixth year of his reign. His son Philip resigned the empire to his brother Robert, who was murdered, after a reign of seven years, when Robert's son, Baldwin II. though a child, succeeded, under the tutelage of John de Brenne, who stiled himself king of Jerusalem.

At length, in the year 1232, Batu, grandson to Gengiskan, the founder of the Tartar empire, after over-running Moscovy, Poland, Silesia, Bohemia, and Hungary, advanced through Bulgaria to besiege Constantinople, when the Eastern and Western Christians uniting, gave him battle, defeated him, and obliged him to abandon his design.

In the year 1259, or, according to others, in 1262, Michael Paleologus recovered Constantinople from Baldwin Courteney; from which time it continued in the possession of the Greek emperors, till the year 1453, when Mahomet, emperor of the Turks, laid siege to that city on the ninth of April, and took it by storm on Tuesday the twenty-ninth of May, the Greek emperor being, as some say, killed in the breach, or, according to others, trampled to death by his own soldiers in their flight. From this time it has been the seat and capital of the Turkish empire.

The climate of Constantinople is extremely delightful; it would indeed be very hot in summer, were it not cooled by a breeze which blows every afternoon from the mouth of the port; and in winter the air is so moderate, that lady Wortley Montague, in one of her letters, mentions her being writing of it on the fourth of January

with the windows open, enjoying the warm sun-shine; while her friends in England were freezing at a sea-coal fire, and her chamber set out with carnations, roses, and jonquils, fresh from her garden.

The city is of a triangular figure, and has the most agreeable and most advantageous situation in the world. It seems as if the canal of the Dardanells, and that of the Black sea, were made to bring thither the riches of all the four quarters of the earth. Those of the Mogul, the Indies, China, and the remotest parts of the north, come by the way of the Black sea; and by the White sea, or sea of Marmora, come the merchandizes of Arabia, Egypt, the coast of Africa, the West Indies, and whatever is produced in Europe.

To the north of the city lies its harbour, which is both convenient and of so large extent, that it is said to be able to contain a thousand ships, it being formed by an arm of the streight which runs north-west up into the country, and is joined by a river. It is encompassed with walls, which have twenty-two gates, six towards the land, as many along the port, and ten on the streight of the sea of Marmora, antiently called the Propontis: these have all landing-places and stairs. The fortifications, however, are too antique and ruinous to make any tolerable resistance against an enemy.

The city stands, like antient Rome, on seven hills, and makes a grand appearance from without, rising gradually from the shore in the form of an amphitheatre. The unequal heights of the buildings make it seem as large again as it is, showing an agreeable mixture of gardens, pine, and cypress-trees, palaces, mosques, and other public buildings, beautifully rising one above another; but it is not equal within to the ideas formed of it when viewed from the Black sea; for the streets are narrow and slippery, running along a declivity, and most of the houses are low, built only of wood and mortar; but are crowded with inhabitants. The best houses stand in the places least subject to any great concourse of people, and where the city is most thinly inhabited; for the finest buildings are without the city near the harbour.

The castle of the Seven Towers joins the walls on the continent side to those that lie upon the sea of Marmora, but is only used as an honourable prison. On the outside it has two large figures in white marble, done in basso relievo, one of which seems to be Endymion, and the other Diana coming to visit him. There are also the nine muses, and the horse Pegasus, all done by a good hand. A square tower stands in the sea, at about two paces from the city walls, where it is said Justinian imprisoned his brave general Belisarius.

By this tower is a spring, for which the Greeks have a great veneration; and, upon the day of Christ's transfiguration, carry their sick to it, give them some of the water, and cover their bodies for some time with the sand; by which means they pretend that surprising cures have been performed.

Near this spring stands the kiosk, or pleasure-house, of the overseer of the gardens. This is a pavilion just without the walls of the seraglio, affording a view of the sea of Marmora and the Thracian Bosphorus. Beyond this kiosk are many cannon planted level with the water, to secure the entrance into the port, and the seraglio, should any attempt it by force; and in the center of the place where these cannon are fixed is one of the four posterns of the seraglio, called the Gate of the Gardens; it has two large turrets, and is guarded by two companies of gardeners, who keep all from entering at this gate, except the officers of the seraglio.

On passing the cannon and doubling the cape, you come to two kiosks, built by Sultan Solyman, to take a view of the men of war as they sail out and come in, and to divert himself with his women. Both of them are adorned with gilt cupolas and alcoves, with rich sofas, and every thing fit for so great a prince. At these pleasure-houses some small gallies and faics attend to receive the Grand Seignior and his train whenever he pleases to divert himself on the water.

The word seraglio signifies no more than a palace. This edifice is of a triangular figure; but is rather a collection of palaces and apartments joined together by the emperors, as their several fancies led them, than one

single building. It is a mile and a half in compass, and is inclosed by a strong wall that has several watch-towers, on which guard is kept day and night; and though it has many gates, both on the sea and land side, only that towards the sea is daily used, and the rest never opened but upon some particular occasions. The principal gate is of marble, and by the Turks called Capi, or the Porte; and from hence you enter the first court, in which are the mint, the infirmary, and other buildings. The second court is called the Divan-Court, the great council-chamber being there, with the kitchen, the treasury, and stables. To the north adjoining to the divan is the seraglio, properly so called, through which is a narrow passage that leads to the audience-chamber, which is of amazing magnificence, particularly the throne. Thus far ambassadors are permitted to come, and no farther dare any foreigners approach, though not a few travellers have had the boldness to say, that they have penetrated the apartments of the women, and have even described the bedchambers of the sultan.

The gardens take in a large compass of ground full of high cypress trees. The buildings are all of white stone, and have gilded turrets and spires, which have a very magnificent appearance, and it is said that the palace of no Christian king is half so large. It has six large courts all built round, and set with trees for the use of the Sultan, and his officers; and on the ladies side, there are said to be as many more.

As no credible author can give a just description of the inner part of the imperial seraglio, we shall here give one of a grand vizier, who was killed at Peterwaradin, and which he built to receive his royal bride, the daughter of a late sultan. This description we shall take from the letters of the ingenious and learned lady, with extracts which we have already embellished this work. "It is situated, says she, on one of the most delightful parts of the canal, with a fine wood on the side of a hill behind it. The extent of it is prodigious, the guardian assured me, there are eight hundred rooms in it; I will not, however, answer for that number, since I did not count them; but it is certain the number is very large, and the whole adorned with a profusion of marble, gilding, and the most exquisite painting of fruit and flowers. The windows are all lashed with the finest glass brought from England, and here is all the expensive magnificence that you can suppose in a palace founded by a vain luxurious young man, with the wealth of a vast empire at his command. But no part of it pleased me better than the apartments destined for the bagnios. There are two built exactly in the same manner, answering to one another; the baths, fountains, and pavements all of white marble, the roofs gilt, and the walls covered with Japan china. Adjoining to them are two rooms, the uppermost of which is divided into a sofa; and in the four corners are falls of water from the very roof, from shell to shell of white marble, to the lower end of the room, where it falls into a large basin, surrounded with pipes that throw up the water as high as the room. The walls are in the nature of lattices, and on the outside of them, there are vines and woodbines planted, that form a sort of green tapestry, and give an agreeable obscurity to those delightful chambers. I shall only add, that the chamber destined for the sultan when he visits his daughter is wainscotted with mother of pearl, fastened with emeralds like nails. There are others of mother of pearl, and olive wood inlaid, and several of Japan china. The galleries, which are numerous and very large, are adorned with jars of flowers, and porcelain dishes of fruit of all sorts, so well done in plaister, and coloured in so lively a manner, that it has an enchanting effect. The garden is suitable to the house, where arbours, fountains, and walks, are thrown together in an agreeable confusion. There is no ornament wanting except that of statues."

The next remarkable structure is that of St. Sophia, which was formerly a Christian church, built in the sixth century by the emperor Justinian. This is a very noble edifice. The dome is said to be one hundred and thirteen feet in diameter, built upon arches, supported by vast pillars of marble: the pavement and stair-case are

also of marble. There are two rows of galleries supported with pillars of a party colour marble, and the whole roof is covered with mosaic work, which decays very fast, and part of it has fallen down. In this structure they show the tomb of the emperor Constantine, for which they have a high veneration. It was with great difficulty the lady Wortley Montague obtained permission to see this structure, and even the mufti was consulted upon the occasion.

Though the mosque just described is generally represented as the noblest building in Constantinople, there are others which seem still more beautiful. That of Sultan Solyman is an exact square, with four fine towers in the angles. In the midst is a noble cupola supported by fine marble pillars, and two smaller at the end supported in the same manner. The pavement and gallery round the mosque is of marble. Under the great cupola is a fountain, adorned with pillars of such beautiful colours, that they seem to exceed nature. On one side is the pulpit of white marble, and on the other a little gallery for the sultan, which is ascended by a fine staircase, with gilt lattices. At the upper end is a kind of altar, where the name of God is written, and before it stand two candlesticks, as high as a man, with wax candles as thick as three flambeaux. The pavement is spread with fine carpets, and the mosque illuminated with a vast number of lamps. The court leading to it is very spacious, and encompassed with galleries supported by columns of green marble, and on two sides covered with twenty-eight cupolas, with a fine fountain in the middle. In all the mosques are little chapels, where are the tombs of the founders and their families, with wax candles burning before them.

This description may serve for all the mosques in Constantinople; for the model of all is exactly the same, and they differ only in size and the richness of the materials. That of the Sultana Valida is the largest, and built entirely of marble. It was founded by the mother of Mahomet IV. The lady we have just mentioned observes, that the size is prodigious; that it is the most beautiful structure she ever saw; and that St. Paul's church at London would make but a pitiful figure near it. She observes too, that this would be the case with any of our squares were they compared with the alterdan or place of horses. This was the Hippodrome in the reign of the Greek emperors. In the middle of it is a brazen column of three serpents twisted together, with their mouths gaping; for their heads are not broken off, as some travellers have pretended. It is impossible to learn the reason for which this pillar was erected: the Greeks can tell only fabulous legends in relation to it, and there is no sign of its ever having had any inscription. At the upper end of this square is an obelisk of porphyry, brought from Egypt; it is adorned with hieroglyphics, which are all entire, and is placed on four little brazen pillars upon a pedestal of square free-stone filled with figures in bas-relief, on two of its sides, one square representing a battle, the other an assembly. On the other sides there are Greek and Latin inscriptions.

The historical pillar mentioned by several authors is no more; it fell down about fifty years ago. Among the other antiquities are the aqueducts, which are prodigiously large, and as ancient as the Greek empire, tho' the Turks have cut upon them some Turkish inscriptions, to give them the honour of having performed so great a work.

The Greeks have thirty churches, and the Armenians a great many. The Roman catholics have also more than one, and the Swedes have been permitted to build a Lutheran church here. The Greek patriarch has a palace, which stands on a hill about two hundred paces from the harbour near the patriarchal church, which is dedicated to St. George.

The exchanges are all noble buildings, consisting of fine alleys, the greatest part with their roofs supported by pillars, and kept wonderfully neat. Every trade has its distinct alley, where the merchandize is disposed in the same order as in Exeter-Exchange in London. The jewellers quarter is extremely rich, and shews such a vast quantity of diamonds and precious stones of all

kinds, that they dazzle the sight. The embroideries are also very rich. The markets are most of them handsome squares, admirably well provided, and affording every thing in the greatest plenty. The other public buildings are the hans and monasteries of dervises; the first are very large and numerous, the second few in number, and not at all magnificent.

The number of people in Constantinople have been computed at eight hundred thousand. The plague, which visits the city every year, frequently makes dreadful havoc: the city has also often suffered by fires, some of which have destroyed from fifty to seventy thousand houses at once. In the year 1754, it suffered much by an earthquake, a fire breaking out at the same time. In 1755 and 1756, two other dreadful conflagrations happened here.

On the west side of the city are the suburbs of Ejap, or St. Job. The country along the streight into the Black-Sea is covered with towns and villages, noble seats, gardens, meadows, vineyards, and woods. The chief officers of the court generally reside there in spring, summer, and the beginning of autumn, both for the benefit of the fresh air, and in order to be near the emperor, who spends the summer at Besictash, where he has a seraglio.

Galata is a suburb surrounded with walls, towers, and moats. This and the following suburbs are situated on the opposite side of the harbour. The inhabitants of Galata are chiefly Greeks, Armenians, Franks, and Jews, who choose it for their residence, for the sake of living more at liberty than in the city. The catholics have a few churches here, and the Greeks have six. Here also are the warehouses of the merchants, and near them close to the harbour is the dock.

At no great distance is Pera, which is also a handsome suburb standing on an eminence, and is the quarter where the Christian envoys reside, though it is principally inhabited by wealthy Greeks. The air is healthy, and the prospect extremely pleasant.

Tophana, which is so called from its cannon foundery, may be considered as another of the suburbs of Constantinople, and lies directly fronting the imperial seraglio.

S E C T. XII.

Of B U L G A R I A.

Its Situation, Extent, Name, Rivers, Mountains, hot Springs, and principal Towns.

THIS country, which was formerly called the Lower Mysia, is bounded on the north by the Danube; on the eastward by the Euxine or Black sea; on the south by Mount Hæmus, which separates it from Romania, last described; and on the westward by Servia. Its greatest length, from east to west, is about two hundred and eighty miles; and its breadth, from north to south, about a hundred and eighty.

It was antiently subject to Thrace; but being conquered by the Romans, it at length, on the division of that empire, fell to the share of the Eastern emperors. Upon the declension of the empire, it was subdued by a people from Asiatic Sarmatia, supposed to have come from the banks of the Volga; from whence some derive the name Bulgaria, from a corruption of Volgaria. Others maintain, that the people who gave their name to this province were called Bulgar, or Bolgar, and the people originally called Bulgares. However, they rendered this country a part of the kingdom of Hungary, and possessed it till it was taken by Amurath II. emperor of the Turks, about the middle of the fifteenth century, since which it has continued under the government of that empire.

The Danube, which runs through this country for the space of eighty miles, receives the Ister of Axiopolis. There is here another river, called the Ishar, which rises in Mount Hæmus, and falls into the Danube near Nicopolis.

The country is in general very mountainous, but the valleys and plains are extremely rich and fruitful, producing

ducing wine and corn in the greatest plenty. The mountains too are also far from being barren, and in particular afford excellent pasturage. Thus that of Stara Plamina, though bare and desolate towards its summit, is extremely fertile in the middle and lower part.

At the foot of the mountain which divides Bulgaria from Servia is a warm bath, where the water gushes out in a stream that is said to be of the bigness of a man's body, and yet but sixty paces from it is another spring in the same valley as cold as ice; but, from the smell, it evidently appears, that they both contain nitrous and sulphureous particles. Upon this mountain is a Greek convent for monks of the order of St. Basil. On the frontiers of Servia, between the mountain of Suha and the river Nissava, are several warm baths, whose waters are of a sulphureous quality, and issue from the mountain deeply tinged with red sand and stones. At the foot of Mount Witoscha, towards the borders of Romania, are likewise four warm baths of great repute, and the mountain has not only iron mines, but is covered with villages, corn-fields, vineyards, and pastures.

Among the natural curiosities of this country are also the vast number of large eagles in the neighbourhood of the town of Babadagi, where the archers all over Turkey and Tartary supply themselves with feathers for their arrows, though each eagle has no more than twelve fit for their use, and those only in the tail. These feathers are commonly sold for a lion dollar.

The inhabitants, who were antiently renowned for their martial achievements, now apply themselves to graziery, agriculture, and handicraft employments. Their language is Slavonic, but differs a little from the Servian in pronunciation. Some of the inhabitants are Greeks, and others Mahometans. The Greek church has here a patriarch, though he is not acknowledged as such by the other patriarchs, and also three archbishops.

The country, being governed by four sangiacs, is consequently divided into four sangiacships. The sangiacship of Sardic contains the following towns:

Sophia, called by the inhabitants Triaditza, is a very large and populous trading town, well built, but open. It is situated on a large beautiful plain, and surrounded with distant mountains. 'Tis hardly possible to see a more agreeable landscape: but the streets are narrow, uneven, and dirty, being paved only in the foot-ways. However, every house has a garden well planted with fruit-trees and shrubs. The Ischa in some places runs along the skirts of the town, and in others passes through it. The principal part of the traders here are Greeks or Armenians. It is the residence of a beglerbeg, and was built by the emperor Justinian out of the ruins of the antient city Sardica. It is one of the greatest thoroughfares in Turkey, since all who travel from Constantinople to Ragusa, Venice, or into Hungary, must pass through this town; but the air is so unwholesome, from its being surrounded with marshes, that it would be in a much less flourishing condition were it not for the residence of the beglerbeg. The mountains to the south make the winter continue longer than the summer, and are the cause of frequent rain. This town is famous for its hot baths, and for their medicinal virtues.

Among the hills, where the steep rocks and dreadful precipices scarce admit of any access, is Trajan's gate, which that emperor erected in commemoration of his marching with his army through this country, where he made a road through places before impassable. This gate consists of two stone pillars, which support an arch representing a large open gate; but this building is now very ruinous: it consists of hewn-stone and bricks; the curious in antiquity have been, however, too busy in taking off the stones, which has greatly effaced this stately monument. In the mountains leading to this gate are several iron works, and a boiling spring.

Ternowa, the antient Ternobum, was formerly the capital of Bulgaria, a royal seat, and fortified, though at present it is but a mean place. It is situated about a hundred and twenty miles to the east of Sophia, is the residence of a patriarch, and has still an archbishop, who is stiled archbishop of Ternowa and all Bulgaria.

The sangiacship of Bibin, or Widin, among other places, contains,

Widin, by the antients called Viminacium, a strong fortification on the Danube, and a bishop's see. In 1739 the Hungarians made a fruitless attempt upon this place.

Colombotz, or Golombotz, a well fortified castle seated on a mountain, at the foot of which is the strong pass of Urania.

This sangiacship also contains several other fortresses, and some pretty good towns.

The sangiacship of Nicopoli contains,

Nicopoli, or Nigepoli, a large town on the Danube, defended by a castle, and rendered famous in history by the first unfortunate battle fought there between the Christians and Turks in the year 1396, when the emperor Sigismund was defeated by Sultan Bajazet, and lost twenty thousand men; though Bajazet is said to have bought the victory so dear as to have sixty thousand slain.

Preslaw, antiently called Marcianapolis, was built in honour of Marciana, sister to the emperor Trajan; its present name signifies an eminent city.

The fourth and last sangiacship is that of Silistria, which contains the following places:

Silistria, a large and fortified town, situated on the Danube. It is a bishop's see, and stands at a small distance from the remains of the wall erected by the Grecian emperors against the inroads of the barbarous nations, sixty-six miles to the eastward of Nicopoli. Its great antiquity appears from the nature of its walls, which are evidently of Roman, and not Turkish architecture. Very few of the inhabitants are Turks.

There are several other towns, but as they are in general small and inconsiderable places, and have nothing worthy of observation, we shall not trouble our readers with a repetition of their names.

The district of Drobrudsch, which extends to the mouth of the Danube, is an entire plain, interspersed neither by woods nor rivers; though at the end of it is a wood called by the Turks Dali-Orman, or Fools-Wood. The inhabitants, who derive their origin from Tartarian emigrants, are famed for their singular hospitality, which is so great, that when a traveller of any religion or country passes through any of their villages, all the house-keepers of both sexes come out to salute him, intreating him in the civilest manner to take up his lodging with them, and kindly accept of what God has been pleased to bestow. The person whose invitation the traveller accepts entertains him and his horses, if they do not exceed three, for the space of three days, with a cordiality and cheerfulness that can scarce be paralleled. He sets honey and eggs before him, in both of which this country abounds, and very fine bread baked in the embers. They also build a little house for the reception of strangers in particular, with couches round the hearth for travellers to use as they think proper.

Having described the Turkish empire in Europe to the west of the Archipelago, the sea of Marmora, and the Black sea, we shall, before we proceed to describe the more western regions, give a description of the European islands of the Archipelago, the Mediterranean, and the Ionian seas.

SECT. XIII.

Of the principal Islands of Greece, in the Archipelago; containing a concise Description of whatever is most remarkable in each, with respect to their Antiquities and present State.

THE most natural method of classing the many island on the coasts of the countries we have just described, seems to be dividing them according to the seas in which they lie; that is, into those of the Archipelago, the parts about Candia, and in what was formerly called the Ionian sea.

The islands of the Archipelago, antiently termed the Ægean sea, lie to the east of Turkey in Europe, and are comprized by antient geographers under two general names; those called the Cyclades, or the Circle Islands, from their forming a kind of circle round Delos; and those

those which lying scattered at a greater distance from Delos were called the Sporades, or Scattered Islands.

Samondrachi, the Electria and Dardania of the ancients, lies near the coast of Romania, and was famous for the worship paid to certain deities called Cabiri, who were held in such high veneration, that it was thought profane even to mention their name. The town of Samondrachi is situated on a mountain that commands a prospect of its spacious harbour.

Embro, or Lembro, the ancient Imbros, is a mountainous island over-grown with woods, harbouring wild beasts and game. It has four villages, one of which bears the same name as the island, and is defended by a castle. It had formerly a town of the same name consecrated to the Cabiri and to Mercury.

Thassus, the ancient Aeria, or Aethria, lies in the gulph of Contesso, and was once famous, even to a proverb, for its gold mines, its fertility, excellent wine, and marble.

Stalimene, the ancient Lemnos, is a fruitful and well cultivated island, seated opposite the streight of the Dardanells. It is of a quadrangular form, about twenty-five miles over: but the eastern part of the island is dry and barren. It has two mountains, which were once volcanoes, and was formerly sacred to Vulcan, whom the inhabitants worshipped as their patron. This island has always been famous for a kind of earth, or bole, called from the place *terria lemnia*, and from the seals or marks stamped upon it *terra sigillata*. It is thought an excellent remedy against poison, the bite of a serpent, wounds, and the dysentery. It is dug up with many ceremonies, that were probably first introduced by the Venetians. The principal Turkish and Christian inhabitants of the island meet on the sixth of August, and on that day only, at a chapel called Sotira, half way between the village of Cochino and the mountain where the earth is found, and from thence proceed in procession to the top of the mountain, where the Greek priests read the Liturgy; after which several persons appointed for that purpose begin to dig, and as soon as they discover a vein of the desired earth, give notice of it to the priests, who fill small hair bags with it, which they deliver to the Turkish governor and other officers present. After they have taken up as much as they think proper, they fill up the place again, and return back in procession as before. Some of the bags are sent to the sultan, and the rest marked with his seal, or with these words, *Tin imächton*, or, The sealed earth, and sold by the *sangiac*, or his deputies, to the inhabitants and foreign merchants. The *sangiac* must send an account to the sultan's treasury of the money annually produced from it; and the inhabitants are punished with death if they keep this earth in their houses, export, or trade in it without his permission. In this island was formerly a famous labyrinth, which consisted of a stately building, supported by forty pillars of an uncommon height and thickness. This island is the residence of a Greek bishop; the principal places here are Cochino, the ancient Hephestias, and Lemno, or Stalimene, formerly Myrina.

Sciro, antiently Sciros, is of a triangular or rather pyramidal form, with a ridge of mountains that cross it two ways. It has a little town of the same name, which is the see of a Greek bishop: besides this town, which has a safe harbour, it has several villages. The country is stony and barren, and has some quarries of marble. The Greek families in the island are computed at about three hundred.

Negropont, antiently Eubœa, and afterwards from its capital called Egripos, is situated on the coast of Livadia, and extends in length from the south-east to the north-west above a hundred miles, but its greatest breadth does not exceed twenty-five. It is, next to Candia, by far the largest island in these seas, and is supposed to have been antiently joined to the continent by an isthmus, that was broke either by the violence of the waves, or by an earthquake. It is divided from the continent by a streight called the Euripus. This island is very fertile, producing corn, wine, fruit, and cattle in such abundance, that all sorts of provisions are extremely cheap. The mountain of Caristo is famous for its excellent marble, and the stone *amianthos*, or *asbestos*, of which incombustible cloth was made, was also found here. About the year 1470

this island was attacked by Sultan Mahomet II. with a fleet of two hundred sail, and a hundred and twenty thousand men; he took it, and the Turks have possessed it ever since. The chief towns in the island are,

Negropont, called by the Greeks Egripos, seated on the south-west coast of the island on the narrowest part of the streight, over which is a small stone bridge of four or five arches, that leads from the coast of Livadia, to a little tower in the middle of the channel, from whence to the town of Negropont is a draw-bridge, no larger than just to let a galley pass through. The walls of the town do not exceed two miles in compass; but there are more buildings and people in the suburbs of the Christians, without the walls than in the city, which is inhabited only by Turks and Jews. The number of inhabitants in both is computed to amount to fourteen or fifteen thousand. The Turks have four mosques, one of which was the cathedral of St. Mark, and the Christians have a bishop, and several churches in the suburbs. This is the chief residence of the captain *basha*, or admiral of the Turkish fleet, who is also governor of the island, and the adjacent parts of Greece, and the harbour is seldom without a fleet of galleys.

Castel Rosso, the ancient Carystus, is a good city, with a commodious harbour on the south-east coast of the island, fifty-five miles to the south-east of Negropont. It is a bishop's see, and very populous. In its neighbourhood were formerly some quarries of marble. Four or five miles to the north-east of this city is Cape Doro, the ancient Caphareum, which is so surrounded with rocks, that it is dangerous to come near it.

The Euripus or streight that divides this island from the continent, has been long celebrated for the stated irregularities of the tide. The jesuit Babin observes, that in the first eight days of the month, and from the fourteenth to the twentieth inclusive, and also in the three last days, it is regular both in its ebb and flood; but on the other days of the lunar month very irregular; the ebb and flood returning sometimes eleven, twelve, thirteen, and fourteen times within twenty-four or twenty-five hours. This irregularity has baffled the researches both of the ancients and moderns.

Andra, the ancient Andros, is eighty miles in circuit, and is one of the most pleasant and fruitful islands in the Archipelago; it is watered by innumerable springs, and has prodigious plenty of wine, oil, barley, and all kinds of delicious fruits; but its greatest riches consist in its silk, in which the inhabitants carry on a great trade. The port is a pretty good one, and the town of Arna adjoining to it, has about two hundred houses. It is the residence of a cady and aga, as also of a Romish and Greek bishop. At some distance from the town may be seen the remains of a large and strong wall, with several columns, entablatures, and pedestals, on which stood statues, and various inscriptions, some of which mention the senate and people of Andros, and the priests of Bacchus; whence it is supposed that here stood the city of Andros. In the island are also between thirty and forty villages, and four or five thousand inhabitants, most of them Greeks, with a colony of Albanians. There are many Greek churches in the island, the Romans also have six churches, with a cathedral dedicated to St. Andrew, and the jesuits have a church dedicated to St. Veneranda.

Engia, or rather Ægina, as it is still called by the Greeks, is situated in the gulph of the same name, and is about thirty miles in circumference. There is only one town in the island, which is said to consist of above eight hundred houses, and is defended by a castle, which stands above it, and is remarkable for the fine prospect it affords of many of the islands, and the coast of the continent. In this castle are about eighty houses, and two churches adjoining to each other, the one for the Greeks, and the other for the Latins. This island produces great plenty of corn, almonds, honey, wax, and cotton.

Colouri, the ancient Salamis, lies towards the bottom of the gulph of Engia, near a promontory, between which and this island runs a streight, which in its narrowest part is not above a mile over. This island is about fifty miles in compass, and has a spacious harbour

on the west side, of an oval figure, on which stands a town, which has the same name as the island; but is said to have only about one hundred and fifty poor cottages, and about four hundred persons. There are two villages, one of them named Metropis, seated on a hill, and the other called Ambelachi, situated near the strait, where the ancient city of Salamis stood. This island is famous for the important victory gained there by the Greeks over the Persians, in which the fleet of Xerxes was defeated by Themistocles.

Porus, the ancient Calabria, lies next to the shore of the Morea; it is about eight miles in compass, and is remarkable for being the place to which Demosthenes was banished.

Zia, or Cea, the ancient Ceos, was formerly famous for its fertility, pastures and figs, and is fifty miles in compass. It now produces corn and wine, and the harbour is full of fish. The town of Zia, which gives name to the island, is situated upon an eminence, in the neighbourhood of the ancient city of Carthea, of the ruins of which, as well as of the ancient city of Zulis, some remains are still visible. Those of the last take up a whole mountain. Near this place are to be seen the ruins of a magnificent temple. The houses of Zia are built of stone and earth, with flat roofs, as are all the houses in the Levant, and are ranged on the side of a hill, like the benches of an amphitheatre. On this island resides a Greek bishop.

Tine, the ancient Tenos, is very mountainous; but in many parts abounds with excellent fruit, and still more in silk. The wine of this place was much admired by the ancients. Besides the town, which is defended by a castle, this island contains between thirty and forty populous villages. Here are also a Greek and Latin bishop, the former of whom is very rich, there being many churches and chapels, and five monasteries of the Greeks in the island.

Mycone is thirty-six miles in compass, and produces wine, figs, and some olives, with barley enough to supply the inhabitants; but has little water and wood. The inhabitants are mostly Greek Christians, and have magistrates of their own religion; but a Turkish officer comes every year to collect the tribute paid to the Porte. A cady also sometimes visits them, and holds courts of justice there. In this island are upwards of fifty Greek churches, and several convents of monks and nuns, tho' they are not very well filled: among these the convent of nuns of Paleo Castro, which is situated in the midst of the island, is the principal. The city of Micone is seated on a large harbour; but the number of its inhabitants is variously represented. This island is said to produce the best sailors in the Archipelago, and has at least five hundred sea-faring men, and above one hundred barks, besides forty or fifty saics for the trade to Turkey and the Morea; that of Turkey chiefly consists in goat-skins, and the Morea trade is chiefly in wine.

Delos, once a celebrated island, but at present a desert rock, is not above seven or eight miles in circuit; it is three times as long as it is broad, and is a secure retreat for the corsairs. This being the imaginary birth-place of Apollo and Diana, it was held in the highest veneration, and its oracle of Apollo was the most celebrated in the world. Here are still to be seen the remains of the celebrated pillar of Apollo, and several noble fragments of the famous temple consecrated to him.

Rhenæa, anciently called the great Deli, lies near the last mentioned island, and has fine pastures; but from the dread of the corsairs it is now uninhabited, though it was anciently extremely populous, as appears from the many stately ruins to be found there.

Syra, the ancient Syros, is mountainous, but produces good wheat, and plenty of barley, wine, figs, olives, and cotton. The air is moist, and cooler than in the neighbouring islands. The inhabitants, except a few Greek families, are of the Romish religion. The town of Syra is built round a little steep hill, and between it and the harbour may be seen the remains of superb buildings, which made a part of the ancient city of Syros.

Thermia receives its present name from the *Thermæ*, or hot springs found there: it is thirty-six miles in circumference, and is not so mountainous as the other islands. The soil, when well cultivated, produces large quantities of barley, wine, and figs; with plenty of honey, wax, silk, and as much cotton as the inhabitants require for their own use: it has also a vast number of partridges. The Greek Christians in this island are computed at sixteen thousand. In the city of Thermia is a bishop, with about fifteen or sixteen churches, and several convents. The people are esteemed very honest, and the women virtuous, handsome, and neatly dressed. The inhabitants are governed by a cady, and four procurators, chosen from among themselves. On the island are still visible the ruins of two cities, one of which on the south coast, must have been of extraordinary splendor.

Siphanto, the ancient Siphnus, is thirty-six miles in compass, and enjoys a wholesome air, good water, and a fertile soil that produces great plenty of fine fruit, with grain sufficient for the support of its inhabitants: here is also no want of tame and wild fowl, and other game. It is said to have once had rich gold and lead mines; but the inhabitants knew nothing of the former, and the latter are not worked. The number of people is computed at five thousand, who inhabit five or six villages, and are chiefly Greeks, yet they are said to have above five hundred chapels, four convents of monks, and two of nuns. The island has five secure harbours, and a castle in a rock near the sea.

Milo, anciently called Melos, consists almost entirely of one hollow porous rock, which is macerated, as it were, by the sea water, and the heat of a continual subterraneous fire is felt by only putting the hand into the holes of the rock: a place in the island is always burning, and the earth around it smoaks like a chimney. Great quantities of allum and sulphur are found; for here allum grows in some natural caverns in the form of flat stones, between nine and ten inches thick. The island also produces plume allum, which grows on the rock. Sulphur is found in one particular place perfectly pure, and as it were sublimated; this is in a cavern, the bottom of which is full of sulphur continually burning. The water in the lower grounds is unfit for common use, and at the foot of a mountain, between the town and the harbour, are baths and some springs, so hot as to scald one's finger. The island abounds in iron mines; but though its surface is in general mountainous and rocky, it has many delightful plains, where the soil is extremely fertile, and produces great plenty of corn, exquisite fruits, especially grapes, melons, and figs; with honey, flesh, fowl, game, and fish. The inhabitants are Greeks, and are said to be given up to voluptuousness, and entirely insensible of the danger of their situation; and there is both a Greek and a Latin bishop. The town of Milo has an excellent harbour, at about the distance of half a mile; it contains about five thousand persons, and was it not for its extraordinary filthiness, it would make a tolerable appearance.

Paros, the antient Platea, is seventeen miles to the east of Siphanto, and about thirty-six miles in compass. It is well cultivated, and the inhabitants feed abundance of flocks. Their trade consists in corn, wine, pulse, sesamums, and calicoes; and, before the Candian war, they had a great deal of oil; but the Venetian army burnt all the olive trees, during the nine or ten years in which they continued there. This island has always been famous for its fine white marble, known by the name of Parian marble, and had also most excellent artists for working it. It was once opulent and powerful; but now contains only fifteen hundred families. The celebrated antiques, called the chronicle of Paros, are marbles that have Greek inscriptions performed on this island, and purchased in the year 1627, by Thomas Howard, earl of Arundel; who, in 1667, presented them to the university of Oxford, and they are now called the Arundelian marbles. These inscriptions form the most authentic piece of antient chronology, they being carved two hundred and sixty-four years before the Christian

era; and contain a space of above three hundred years. The town of Parichia seems to stand on the ruins of the antient Paros, the walls and houses being decorated with several fine remains of that city; and there are ancient monuments to be seen in the adjacent country. The Penagia, or Madonia, without the city, is the largest and most splendid church in the Archipelago. There are a great number of churches and chapels in this island, and also several considerable villages. A large fleet may lie conveniently and securely in the harbour of St. Maria; but the usual anchoring-place for the Turkish navy is Drio, on the west side of the island.

Antiparos, the antient Oliaros, stands about two miles to the west of Paros, and is only a rock about sixteen miles in circuit; yet in some part of it is well cultivated, and produces as much barley as serves a small village. The port is navigable only for small barks. This island is remarkable for a grotto, which is one of the greatest curiosities perhaps in nature, and seems to prove one of the most important truths in natural philosophy, the vegetation of stones. This grotto appears to be about forty fathoms high, and fifty broad: the roof forms a pretty good arch, which every where entertains the eye with an infinite variety of figures of a white transparent crystalline marble, representing vegetables, marble pillars, and a superb marble pyramid; all which appear to be natural.

Nixia, the antient Naxos, is a hundred and twenty miles in compass. This is the most fertile island in all the Archipelago, and its wine still maintains its former excellence. Its plains are covered with citron, orange, olive, pomegranate, apple, mulberry, cedar, and fig trees. It was also famed for a kind of marble called by the Greeks ophites, it being green speckled with white like a snake, and some mountains on the western coast afford emery, whence the Italians called the adjoining cape Cape Smerigli, or Cape Emery. It was taken from the Turks by the Venetians, and there are still several noble families in it descended from the latter. All the people of the island do not exceed eight thousand, and there is but little harmony between the Greeks and the Latins, who have each an archbishop here; the former of whom is rich, and has a handsome cathedral. The inhabitants have such violent feuds among themselves, that sometimes they will not speak to one another as long as they live; in this the women are said to be more obstinate than the men. The inhabitants, like those of most of these islands, have the choice of their own magistrates; but sometimes a cady takes a circuit among them, and to him appeals lie. The island contains between forty and fifty villages, and only one town, which is seated on the south side of the island, and is defended by a castle. About a musket shot from it stands, on a rock near the sea, a beautiful marble portal, amidst a heap of fragments of marble and granite, supposed to have been a temple of Bacchus. The inhabitants carry on a considerable trade in barley, figs, wine, cheese, salt, oxen, sheep, mules, oil, cotton, silk, flax, and emery.

Patino, Palmosa, or Palmora, the antient Patmos, is by some geographers placed in Asia, and by others in Europe; it is about eighteen miles in compass, and has only one well built town, in the middle of which is the castle called the Monastery of St. John, inhabited by two hundred Greek monks. St. John the Evangelist being banished into this island, is said to have written here his Revelations. In their church they carefully keep a body shut up in a case, which they pretend to be that of St. John, and shew a cave where they say he wrote his Apocalypse. There are about three thousand persons in the island, all of whom are Christians, who pay tribute to the Grand Seignior; but the soil being dry and rocky, they find it difficult to live: though no Turks reside in the island, the corsairs put in there to carcen and take in fresh water.

Amorgo, antiently Amorgos, extends from north to south, and does not exceed thirty-six miles in compass: it is exceeding steep towards the south-east, but enjoys a good soil, and produces excellent wine. The town is built in the form of an amphitheatre round a rock, with a castle upon it. At about three miles distance stands a large Greek convent. The island is well cultivated, and

yields oil enough for the inhabitants, and great plenty of corn and wine.

Policandro is eight miles in compass: it is a pleasant island; but has no port, and only a creek on the south-east side. It has but one village, in which there are three well built churches, two monasteries of men, and a convent of women. There are no other houses in the island besides those of this village. The island is rocky, and affords a scanty subsistence to its inhabitants, who are an honest, civil, and courteous people; and carry on some trade in cotton.

S E C T. XIV.

Of Candia, and the Islands lying about it; with a very particular Account of the rising of some new Islands by Means of Earthquakes.

CANDIA, the antient Crete, one of the largest and most celebrated islands in the Mediterranean, is situated between the thirty-fourth degree forty minutes and the thirty-fifth degree forty minutes of north latitude, and between the twenty-third degree fifty minutes and the twenty-seventh degree six minutes east longitude from London; and being a long and narrow island, extending from east to west, its greatest length, from Cape Garabusa to Cape Solomon, is about a hundred and sixty miles; and its greatest breadth, which is towards the middle, does not exceed forty-four miles; every where else it is much narrower. It lies south-east of the Morea, before the mouth of the Archipelago.

The people breathe a pure air; but the south wind is dangerous, and sometimes suffocates those who are exposed to it.

Above half the island is covered with rocky barren mountains, the most famous of which is Psiloriti, the antient Ida, the highest in the island. This is now one continued barren rock, and, for the greatest part of the year, its summit is covered with snow. The only thing it produces is the tragacantha, famous for its gum. This mountain commands a view of both seas.

This island has many springs and rivulets of excellent water, but no rivers proper for carrying boats.

It has many valleys and plains remarkably fertile; and though not half of these are cultivated, yet the country not only abounds in wine, but also supplies strangers with oil, wool, cheese, silk, honey, wax, and opium. Their wine and wheat are excellent; their silk would be exceeding good, did they but know how to manage it; their honey is admirable, and smells of the thyme with which the whole country abounds. The quince-tree was first brought into Italy from the town of Cydonia, in this island, and was therefore called by the Romans the Cydonian apple.

In the island are abundance of cows, sheep and swine, hares and rabbits. There is no want of poultry, and great plenty of pigeons, turtle-doves, woodcocks, red partridges, and wheat-eats.

The antient poets make frequent mention of the hundred cities of this island, on which account it was called Hecatompolis; but it had many more, a hundred and twenty occurring in antient writings; and under the emperor Valentinian I. above a hundred towns were overthrown and destroyed by an earthquake.

The island had originally its own kings; but the republican form was afterwards introduced. It was first subdued by the Romans, and continued subject to the Eastern emperors, till the year 823, when it was conquered by the Saracens; from whom it was recovered again in the year 962. It was afterwards taken by the Genoese, who ceded it to Boniface, marquis of Montferrat; and he, in 1204, sold it to the Venetians. In 1644 the Turks made a descent, and, after a siege of twenty years, reduced the whole country, which, except a few forts, the Venetians were obliged to cede to them at the peace in 1669; and in 1715 the Turks made themselves masters also of the Venetian forts; since which time the island has been entirely in their possession.

The inhabitants are Greeks, who have an archbishop; and Armenians, Turks, and Jews.

In most of the villages the houses are built of rugged unhewn pieces of white marble, joined with mud instead of mortar: they have but one floor, which is divided into two or three apartments. The roof is formed of faggots placed upon joists, and covered with a kind of terrafs.

The city of Candia, the capital of the island, is seated about the middle of the northern coast. It stands on the ruins of Heraclea, which, with great probability, is supposed to have been the same with Matium. The city at present is, however, little better than a desert, except the market-place and a few of the adjoining streets, where the principal inhabitants reside; in the rest there is hardly any thing but rubbish, occasioned by the last siege, which was one of the most considerable that was undertaken in the last century. The harbour is also choaked up, so that no other vessels but boats can enter it. There are computed to be in this city about eight hundred Greeks, who pay the capitation or poll-tax, and their archbishop is the metropolitan of the whole island. The Armenians have but one church here, and are about two hundred in number; and the Jews amount to about a thousand. The rest of the inhabitants are Turks, among whom is a considerable body of janizaries. The country about Candia consists of spacious and fruitful plains, enriched with all sorts of grain; but the exportation of wheat is prohibited, without first obtaining leave from the beglerbeg.

The second city in point of rank is Canea, the antient Cydonia, which stands on the northern coast, and is said to contain above fifteen hundred Turks, two thousand Greeks, fifty Jews, and about a dozen French merchants, who have a consul. It is the see of a Greek bishop, suffragan to the archbishop of Candia. This town is pretty strong, it having a good wall faced with stone, and defended by a deep ditch. The entrance of the port is defended on the left by a small fortress, where there is a light-house. The castle is on the left, beyond the first bastion. The houses are very indifferent, and the best of them never exceed two stories high; the first of which, or the ground-floor, has a parlour, warehouse, cellar, and stable. The walls are of brick, with free-stone angles. The ascent from the first floor to the second is by a wooden ladder, set almost perpendicular. The second floor is also divided into several apartments, and covered with deal boards, supported by joists of oak laid two or three feet asunder. On the outside it is covered with earth tempered like mortar, well beaten, and then paved with small flint stones and pebbles. The terrafs is made a little sloping for the rain to run off. In fine weather they walk on these terrasses, and when it is very hot lie upon them. Every house has commonly besides these flat roofs a small terrafs on the same floor with the second story; but this is properly only an open room, adorned with pots of flowers. The country about Canea is extremely delightful, and the forests are diversified with lofty olive-trees, pleasant fields, vineyards, flower-gardens, and streams shaded with myrtle and laurel.

The third city in point of rank is that of Retimo, which stands on the northern coast of the island, twenty-six miles to the west of Candia. The city is encompassed by a mean wall, and is defended by a citadel, which stands on a steep rock that stretches out into the sea. The country about Retimo is all rock on the west side; but towards Candia it is very delightful, nothing being to be seen along the shore but gardens. Cherries are earlier here than in any other part of the island, and all the fruit is better tasted. Their silk, wool, honey, wax, and oil are preferred to all others. The water that supplies the town gushes out of a narrow valley about a mile to the southward, and they have cut a channel to bring it to Retimo; but they lose one-half of it by the way. On the road leading to the valley is a handsome mosque, and in the court before it a han, or caravanfara, where travellers, who arrive after the gates of the town are shut, or design to set out before they are opened, may lodge and eat gratis.

The village of Gartina stands amidst the ruins of a noble city, named Gortyna, about six miles distant from Mount Ida, at the foot of low hills, just at the entrance

of the plain of Messaria, which is properly the granary of the island. These ruins are an evident proof of the magnificence of that city, but it is impossible for a stranger accustomed to contemplation to behold them without concern. The people plough, sow, and feed sheep amidst a prodigious quantity of marble, jasper, and granite, wrought with the most admirable art; and, in room of the great men who once caused these stately edifices to be erected, are only to be seen shepherds and husbandmen.

One of the greatest curiosities of this island is a cave, called the labyrinth, which runs under a small mountain at the foot of Mount Ida, in a thousand intricate meanders, without any appearance of regularity, and is generally thought to be a work of nature. The entrance is a natural aperture, seven or eight paces broad; but in some places so low, that there is no going in without stooping. The ground is rugged and uneven; but the top level, consisting of a horizontal layer of stones. The principal passage, in which there is less danger of bewildering one's self than in the others, is about twelve hundred paces in length, and reaches to the end of the maze, where are two spacious chambers. The most dangerous part of the main walk is about thirty paces distant from its mouth; for if a person happens to take any other course, he is immediately lost, amidst the innumerable windings of this maze, and then it is no easy matter for him to find his way out; on which account travellers always provide themselves with guides and torches. There is little appearance of this place having ever been a stone-quarry, and whether it was ever the famous labyrinth of Crete, is far from being satisfactorily proved.

To the northward of Candia is the island of Santorini, that is Sant Erini, thus named from St. Irene being its patroness. This island, which was antiently called Calista, and afterwards Thera, is about thirty-six miles round; and the coast is so craggy and rugged as to be almost inaccessible, and great part of the island is covered with pumice-stones; yet the inhabitants have, by their labour, rendered the island fruitful, particularly in barley and wine, which is of the colour of rhenish, and cotton, which grows in great plenty. It also produces some wheat. The inhabitants, who are computed to amount to ten thousand, are all Greeks, but one-third of them are of the Latin church, and subject to a popish bishop. There are five populous villages in the island, and several castles erected on the coast.

Cerigo, the antient Cythera, is an island which was in a particular manner consecrated to Venus, and is situated between Candia and the Morea; but being mountainous and rocky produces little corn, wine, or oil, it has therefore no great number of inhabitants, but does not want for sheep and fowls, both tame and wild. The principal town, which is on the south side of the island, has a castle on a very steep rock; but the harbour below it lies open to the south winds.

Acroteri is an island famous in natural history; it seems to be composed of pumice-stones, incrustated with a surface of fertile earth, and the ancients represent it as rising in a violent earthquake out of the sea. Four other islands near Santorini had the same origin, and yet the sea is here of such a depth, as to be unfathomable by any sounding line. The first, which is in the harbour of Apanormia, a port of Santorini, was antiently called Hiera; but is now named Megali Cammeni, that is, the Great Burnt island, rose out of the sea after a violent earthquake in the nine hundred and sixth year before the birth of Christ; and in the beginning of the eighth century, a new island suddenly appeared with a terrible explosion, and adhered to the island of Hiera, which by this means became considerably enlarged. The second island, which lies a little without the harbour, was antiently called Therasia; but now from its whiteness, is named Aspronisi, and sprung from the sea in the first century. In 1573, a sudden fire bursting out of the sea, soon produced a new island, to which was given the name of Micri Cammeni, or the Small Burnt island. Another island arose in the years 1707 and 1708, between this island and great Cammeni. The reader will not be displeased at seeing here a particular account of this

this extraordinary phenomenon; for no circumstance can be more worthy of being preserved in a system of geography, than the birth of an island.

On the twenty-third of May 1707, after an earthquake that happened the night before, the last mentioned island was discovered early in the morning by some seamen, who taking it for a wreck, rowed immediately towards it; but finding rocks and earth instead of the remains of a ship, halted back, and spread the news of what they had seen in Santorini. How great soever the apprehensions of the inhabitants were at the first sight, their surprise soon abated, and in a few days, seeing no appearance of fire or smoke, some of them ventured to land on the new island. Their curiosity led them from rock to rock, where they found a kind of white stone that cut like bread, which it nearly resembled in its form, colour, and consistence. They also found many oysters sticking to the rocks; but while they were employed in gathering them, the island moved and shook under their feet, upon which they ran with precipitation to their boats. With these motions and tremblings the island increased, not only in height, but in length and breadth; yet sometimes while it was raised and extended on one side, it sunk and diminished on the other. Our author observed a rock rise out of the sea, forty or fifty paces from the island, which having continued four days, sunk and appeared no more; but several others appeared and disappeared alternately, till at last they remained fixed and unmoved. In the mean time the colour of the surrounding sea was changed: at first it was of a light green, then reddish, and afterwards of a pale yellow, accompanied with a noisome stench, which spread itself over part of Santorini.

On the sixteenth of July the smoke first appeared, not indeed from the island, but from a ridge of black stones which suddenly rose about sixty paces from it, where the depth of the sea was unfathomable. Thus there were two separate islands, one called the White, and the other the Black island, from their different colour. This thick smoke was of a whitish colour, like that of a lime kiln, and was carried by the wind to Santorini, where it penetrated the houses of the inhabitants.

In the night between the nineteenth and twentieth of July, flames began to issue with the smoke, to the great terror of the inhabitants of Santorini, especially those of the castle of Scaro, who were not above a mile and a half distant from the burning island, which now increased very fast, large rocks daily springing up, which sometimes added to its length, and sometimes to its breadth. The smoke also increased, and there being no wind, it ascended so high as to be seen at Candia, and other distant islands. During the night, it resembled a column of fire fifteen or twenty feet high, and the sea was then covered with a scurf or froth, in some places reddish, and in others yellowish, from whence proceeded such a stench, that the inhabitants throughout the whole island of Santorini burnt perfumes in their houses, and made fires in the streets, to prevent infection. This indeed did not last above a day or two, for a strong gale of wind dispersed the froth; but drove the smoke upon the vineyards of Santorini, by which the grapes in one night were parched up and destroyed. This smoke also caused violent head-achs, attended with reachings.

On the thirty-first of July, the sea smoked and bubbled in two different places near the island, where the water formed a perfect circle, and looked like oil when ready to boil. This continued above a month, during which many fish were found dead on the shore of Santorini. The following night was heard a dull hollow noise, like the distant report of several cannon, which was instantly followed by flames of fire, shooting up to a great height in the air, where they suddenly disappeared. The next day the same hollow sound was several times heard, and succeeded by a blackish smoke, which, notwithstanding there being a pretty fresh gale, rose up in the form of a column to a prodigious height, and would probably in the night have appeared as if on fire.

On the seventh of August the noise was different, it resembling that of large stones thrown all together into a deep well. This noise, having lasted some days, was succeeded by another much louder, so nearly resembling thunder, as hardly to be distinguished from three or four real claps, that happened at the same time.

On the twenty-first, the fire and smoke were considerably diminished; but the next morning they broke out with greater fury than before. The smoke was red and very thick, and the heat was so intense, that all round the island, the sea smoked and bubbled in a surprising manner. At night, our author viewing with a telescope a large furnace upon the highest part of the island, discovered sixty smaller openings or funnels, all emitting a very bright flame, and he imagined there might be as many more on the other side of the great volcano. On the twenty-third of August in the morning, the island was much higher than the day before, and its breadth was increased by a chain of rocks sprung up in the night almost fifty feet above the water. The sea was also again covered with reddish froth, which always appeared when the island received any considerable additions, and occasioned an intolerable stench, till it was dispersed by the wind, and the motion of the waves.

On the fifth of September, the fire opened another vent at the extremity of the Black Island, from whence it issued for several days, during which but little rose from the large furnace: and from this new passage the astonished spectators beheld the fire dart up three several times to a vast height, resembling so many prodigious sky-rockets of a glowing lively red. The following night the subterraneous fire made a terrible noise, and immediately after a thousand sheaves of fire flew up into the air, where, breaking and dispersing, they fell like a shower of stars upon the island, which appeared all in a blaze, presenting to the amazed spectators at once a most dreadful and beautiful illumination. To these natural fire-works succeeded a kind of meteor, which, for some time, hung over the castle of Scaro, which is seated on a high rock in the island of Santorini, a meteor not unlike a fiery sword, and which served to increase the consternation of the inhabitants.

On the ninth of September the White and Black Islands united, after which the western end of the island daily increased. There were now only four openings that emitted flames, which issued forth with great impetuosity, sometimes attended with a noise like that of a large organ pipe, and sometimes like the howling of wild beasts. On the twelfth the subterraneous noise became much augmented, having never been so frequent nor so dreadful as on that and the following day. The bursts of this subterranean thunder, like a general discharge of the artillery of an army, were repeated ten or twelve times within twenty-four hours, and immediately after each clap, the large furnace threw up huge red hot stones, which fell into the sea at a great distance. These claps were always followed by a thick smoke, which spread clouds of ashes over the sea and the neighbouring islands.

On the eighteenth of September an earthquake was felt at Santorini, but did no great damage, though it considerably enlarged the burning island, and in several new places gave vent to the fire and smoke. The claps were also more terrible than ever, and in the midst of a thick smoke that appeared like a mountain, were seen and heard large pieces of rock thrown up with as much noise and force as balls from the mouth of a cannon, which afterwards fell upon the island, or into the sea. One of the small neighbouring islands was several times covered with these fiery stones, which being thinly crusted over with sulphur gave a bright light, and continued burning till that was consumed.

On the twenty-first, after a dreadful clap of subterraneous thunder, very great lightnings ensued; and, at the same instant, the new island was so violently shaken, that part of the great furnace came tumbling down, and huge burning rocks were thrown to the distance of two miles and upwards. This seemed to be the last effort of the volcano, and to have exhausted the combustible matter, as all was quiet for several days after. But on the twenty-fifth the fire broke out again with still greater fury, and

among the claps was one so terrible, that the churches of Santorini were soon filled with crouds of people, expecting every moment would be their last; and the castle and town of Scaro suffered such a shock, that the doors and windows of the houses flew open. The volcano continued to rage during the remaining part of the year; and in the month of January, 1708, the large furnace, without one day's intermission, throwed out stones and flames, at least once or twice, but oftener five or six times a day.

On the tenth of February, in the morning, a pretty strong earthquake was felt at Santorini, which the inhabitants considered as a prelude to greater commotions in the burning island: nor were they deceived; for soon after the fire and smoke issued in prodigious quantities, the claps like thunder were redoubled, and nothing appeared but horror and confusion; rocks of an amazing size were raised up to a great height above the water, and the sea raged and boiled to such a degree, that it occasioned a general consternation. The subterraneous bellowings were heard without intermission, and sometimes in less than a quarter of an hour there were six or seven irruptions from the large furnace. The noise of the repeated claps, the quantity of huge stones that flew about on every side, the houses tottering to their very foundations, and the fire, which now appeared in open day, surpassed all that had hitherto happened, and formed a scene astonishing beyond description.

The fifteenth of April was rendered remarkable by the number and violence of the bellowings and irruptions, by one of which near a hundred large stones were thrown up all together into the air, and fell again into the sea at about two miles distance. From this time to the twenty-third of May, which might be called the anniversary of the birth of the new island, things continued much in the same state; but afterwards the fire and smoke by degrees subsided, and the subterraneous thunders became less terrible.

On the fifteenth of July our author, accompanied by the Romish bishop of Santorini, and some other ecclesiastics, hired a boat to take a near view of the island. They made directly towards it on that side where the sea did not bubble, but where it smoaked very much. Being got into this vapour, they felt a close suffocating heat, and found the water very hot; upon which they directed their course towards a part of the island at the farthest distance from the large furnace. The fires, which still continued to burn, and the boiling of the sea, obliged them to take a great compass; and yet they felt the air about them very hot and sultry. Having encompassed the island, and surveyed it carefully from an adjacent one, they judged it to be two hundred feet above the sea, about a mile broad, and five miles in circumference: but not being thoroughly satisfied, they resolved to attempt to land, and accordingly rowed towards that part of the island where they perceived neither fire nor smook; but when they had got within a hundred yards of it, the great furnace discharged itself with its usual fury, and the wind blew upon them a thick smoke and a shower of ashes, which obliged them to quit their design. Having retired a little, they let down a plummet, with a line ninety-five fathoms long; but it was too short to reach the bottom. On their return to Santorini, they observed that the heat of the water had melted most of the pitch from their boat, which was therefore grown very leaky.

From this time, till the fifteenth of August, when our author left Santorini, the fire, smoke, and noise continued pretty moderate; and, by the accounts he received from thence for several years after, it appears that the island still increased, but that the fire and subterraneous noise were much abated; and as the travellers who have since visited the Levant give no account of its burning, it has doubtless long ceased.

Strange as this account may appear, it is allowed to be unquestionably true; and indeed these are not the only instances in which islands have been known to rise from the bottom of the sea, of which we have a recent instance in the Philosophical Transactions, of an island near the Azores thus raised by subterraneous fires, in the year 1720.

SECT. XV.

Of the Islands in the Sea antiently called the Ionian.

ALL these islands lie on the western coast of Turkey in Europe, and therefore properly deserve a place here. These are,

Le Sapienze, antiently the Sphagi islands, which are three small islands lying near the coast of the Morea. The largest was formerly called Sphacteria, and was famous in antient history for the victory obtained there by the Athenians over the Lacedemonians. The adjacent sea is called the Sea of Sapienza, or of Wisdom, because the pilots are obliged to make use of a great deal of wisdom and caution in getting through the rapid and dangerous currents near this island. The second island is only separated from the first by a channel, which does not exceed two or three miles over: this is called Fuschella, or Catretra, by mariners; and the third, which lies to the east of the former, is named San Venatica.

Strivali, the antient Plotæ, or the Floating Islands, are two small islands, the largest of which is not above two leagues and a half in compass; but they have good springs of water, and the soil is very fruitful. The inhabitants, however, never marry, for they are said to have no women amongst them, and only consist of three or fourscore Greek monks, whose convent is built in the form of a fortress, and is well provided with cannon, in order to keep off the corsairs.

The following islands belong to the Venetians:

Zante, the antient Zacynthus, is situated near the strait of the gulph which runs between the Morea and Livadia, already described, in thirty-seven degrees fifty-seven minutes latitude, and is supposed to be about twenty-four miles in length, twelve in breadth, and fifty in compass. The country is pleasant, and fertile in corn, wine, oil, and all kinds of excellent fruits; especially the finest muscadine grapes, and currants of the sort brought to England. The melons of this island are in particular request, as are also their peaches, which are of a prodigious size, some weighing between eight and ten ounces, and are of an exquisite taste and flavour. On the south and west side of the island is a large chain of mountains, with a mountain also towards the east, and another at the north; so that it is in a manner surrounded by them. In the center is a delightful plain, and near Chieri, a seaport, is a resinous spring. The island contains many towns and villages, and the Greeks, who constitute the majority of its inhabitants, have a bishop, and above forty churches, besides convents. Another part of the inhabitants are Roman catholics, who have a bishop and three convents. The remainder of the inhabitants are Jews. The city of Zante is large and populous: it stands on the east side of the island, and has a commodious and safe port to those who are acquainted with its entrance; but has no walls, and is only defended by a strong fortress, which is erected upon an eminence, and is well defended with cannon. The houses of the city are built with large square stones, but are very low, on account of the frequent earthquakes which generally happen in the spring, when it is said that they seldom fail of feeling one or two, if not more, in a week. In the rock on which the city is built are abundance of fine springs of sweet water. The city is governed by a proveditor and two counsellors, who reside there; and both the English and Dutch have a factory and consul, with a number of merchants and factors for the staple commodities of this place, which are chiefly raisins and currants; but the English are esteemed the greatest promoters of this trade, as they consume more of the latter than perhaps half Europe besides.

Cephalonia, antiently called Cephalenia and Samos, is situated in the thirty-eighth degree of latitude, and is a considerable island, extremely fertile, and producing currants, oil, red wine, muscadine grapes, citrons, oranges, pomegranates, and grain. Most of the trees bear twice a year, that is in April and November; but the fruit of the last month is smaller than the other. It had formerly four

four considerable towns; but has now only some large villages, with a city of its own name, defended by a fortress, seated upon a hill, about six miles distant from Argostoli, the principal port of the island. This port is large, and well sheltered on all sides; but the bottom is not secure, the anchors not sticking fast. At the entrance is a large village, where most of the merchants reside. The island is chiefly inhabited by Greeks, who pay a tribute to the Venetians, who have here a provveditor and two counsellors.

The next island is Val di Compare, the name given to the island of Ithaca, famous for being the country of Ulysses.

Santa Maura, antiently called Neritis, and since Leucas, was in former ages a peninsula connected with the continent of Acarnania; but the Carthaginians, or, according to others, the Corinthians, severed it; so that there is at present a channel about fifty paces broad between the island and the continent. In this island were formerly three considerable towns, with a most magnificent temple of Venus. The best harbours are Santa Maura, Demata, and Englimeno. This island enjoys an uncommon plenty of corn, wine, oil, almonds, pomegranates, citrons, and other fruits, with fine pastures. The inhabitants are Greeks, subject to a bishop. The town of Santa Maura, which gives name to the island, contains about five or six thousand inhabitants; and being situated in the water, and defended by walls and towers, is so fortified, that there is no convenient approach to it, either by land or water. Beyond its works, in a morass, are two well inhabited islands, or suburbs. The cluster of little islands between this and the continent have a communication with each other by bridges. In 1473 the Turks dispossessed the Grecian emperor of the town and island. In 1502 the Venetians made themselves masters of it; but afterwards surrendered it again to the Turks; and in 1684 recovered it from them. In 1715 the town and island fell a second time into the hands of the Turks; but the following year the Venetians drove them out, and have ever since kept a provveditor there.

Corfu, antiently Phæacia, and afterwards Corcyra, takes its present name from the antient castle of Corypho, which stands on a mountain, and is so called from the Greek word *κορυφή*, a hill. It is seventy Italian miles in length, and, from Cape Barbaro to Cape Balacrum, thirty broad; but in most other places scarce twelve. It was famous in former ages for the beautiful gardens of king Alcinous. Its southern parts are barren, mountainous, and destitute of water; but the northern coast is very fertile in all kinds of delicious fruits, excellent wine, grain, olives, &c. It has but two cities, Corfu, the capital, and Cassopo, the Cassiope of the antients. But, besides these cities, it is said to have about a hundred villages. The city of Corfu is very strong, and constantly keeps between fifteen and twenty galleys, besides other vessels, for its defence. It has, besides, two fortresses, the oldest of which is situated on a steep craggy rock, and surrounded below with good strong bastions; the other, though not so advantageously situated, has been fortified at an immense expence, and the city is now one of the strongest places on all these coasts: it is governed by a balio, provveditor, capitano, and castellano, who are all noble Venetians; as is also its archbishop, who is primate and metropolitan of all these islands. The cathedral is a fine building, as is also that which belongs to the Greeks, both of which are adorned with paintings and other expensive ornaments. There are abundance of other handsome churches and structures, both here and in other parts of the island: here is also an academy of the liberal arts and sciences. The island is divided into four parts, called *balias*, or governments, under a balio. To the eastward is the government of Alefchimo, which contains twenty-eight villages, and twenty thousand people. In the middle part is the government of Mezzo, which contains no less than twenty-five thousand people. In this part is situated Corfu, the capital, and thirty towns. Agiru, the western part, comprehends twenty villages, and about eight thousand inhabitants; but the only remarkable place in it is the castle of St.

Angelo. Oros, the north part, contains twenty-five towns, and about eighteen thousand people.

SECT. XVI.

Of ALBANIA, or ARNAUT, and TURKISH DALMATIA.

Their Situation, Extent, Produce, and Rivers: the Persons and Manners of the Natives; with an Account of the principal Towns.

THIS country, which comprehends the old Grecian Illyricum and Epirus, lies between Macedonia on the east and the gulph of Venice and the Ionian sea on the west, having on the north-east and north a chain of mountains, called Monte Negro, or the Black Mountains, which divide it partly from Macedonia, and partly from Servia and Dalmatia, and on the south is bounded by Livadia. Its greatest length from north to south is about two hundred and ninety miles, and its breadth from east to west ninety-six, extending from latitude thirty-nine degrees to forty-three degrees thirty minutes.

The soil is fruitful, but more so towards the north than towards the south, and produces flax, cotton, and excellent wine; as also wax, and salt dug out of the mountains.

The chief rivers of Albania are the Bojana; the Drino Negro; the Argenta; the Siomini, antiently called Paniafus; the Chrevasta, the antient Apsus; the Pollonia, the antient Laous; and the Delichi, the antient Acheron, frequently mentioned by the poets.

The Albanians are generally tall, strong, and highly esteemed by the Turks on account of their valour. They are subject to the Grand Seignior, and have often distinguished themselves in the wars in Hungary. They are more courageous on horseback than on foot, and their horses are extremely swift. This was the country of the famous prince George Castriot, generally known by the name of Scanderbeg, who, with a small army, opposed for many years all the power of Turkey, and gained twenty-two battles. At his death he left his country to the Venetians; but they were unable to maintain the inland part of it, which was soon reduced by Mahomet II. and his successors have held the whole country ever since.

The inhabitants make tapestry, which they export; but they have scarce any notion of learning, yet are very skilful in laying aqueducts, and without any mathematical instruments measure heights and distances with all the exactness of a geometrician. Those of part of the country are Roman catholics, and most of the rest follow the doctrines of the Greek church.

The principal towns of Albania are,

Scutari, called by the Turks Iscodar, a large and fortified town near a lake of the same name, is well fortified, and defended by a strong castle, seated on a hill; it enjoys a great trade, is the residence of a beglerbeg, and an archbishop. It was formerly the seat of the kings of Illyricum. In the years 1474 and 1478, it was in vain besieged by the Turks; but the Venetians surrendered it to them in 1479.

Dulcigno, or Dolcigno, the ancient Ulcinium, is seated on the gulph of Venice, twenty miles to the south-west of Scutari: it has a good harbour, and a strong castle; it contains seven or eight thousand people, and carries on a considerable trade.

Alessio, the ancient Lyllus, is situated near the river Drin, two miles above its mouth, and sixteen to the south of Scutari. It stands on a steep coast, and is defended by a strong castle. It is by some esteemed the capital of Albania, and is particularly famous for being the place where Scanderbeg died, and was buried in the year 1467. It is said the Turks have such veneration for him, on account of his valour, that they carry away pieces of his tomb for relics, and esteem them as a charm to animate their courage in battle.

Durazzo, the ancient Epidamnus, and the Dyrrachium of the Romans, is a small sea-port on a peninsula in the gulph of Venice, thirty-five miles to the south of Scutari. It has a pretty good harbour and castle.

La Valona, the ancient Aulon, stands on a bay at the mouth of the gulph of Venice, and was anciently fortified. It has a spacious, but not very secure harbour.

Chimera is seated near the coast of the Ionian sea, on the banks of a little river, and has a good harbour. It is famous for its warm baths; but is at present only a mean place. It is, however, the capital of a small country of the same name, the inhabitants of which are stiled Chimarioti, and are descended from the ancient Macedonians. Besides their capital, they have a few inconsiderable towns on the sea-coast; but the mountains of Chimera are so high, and of such difficult access, that they serve them instead of fortresses; and the people trust so much to this advantage, that, according to Mr. Wheeler, they refuse paying tribute to the Turks.

Larta, a large and well peopled town on a bay of the same name, containing seven or eight thousand inhabitants, above half of which are Greeks, and the rest Turks. It is the see of an archbishop, and has a very large cathedral, supported by above two hundred marble pillars, and said to have as many doors and windows as there are days in the year.

Turkish Dalmatia extends from Albania through the country of Herzegowina, to Bosnia. A small part of this country is, at its most southern extremity, bounded on the west by the gulph of Venice; but first extending east through Venetian Dalmatia, then turns to the north-east, on the back of the territories of Ragusa and Venice. Thus it is bounded on the south by a part of Venetian Dalmatia, and Albania, on the north-east by Bosnia, and on the west by Venetian Dalmatia, Ragusa, and the Adriatic sea, or gulph of Venice, extending about one hundred and forty miles from north to south; but no more than forty-five miles from east to west. The soil is in some parts mountainous; but is otherwise very fruitful in corn, wine, oil, honey, and wax.

Its principal towns are,

Great and Little Melanto, two sea ports; but of small importance.

Scardona, in the Sclavonian language Skardin, is situated on the river Kirka, surrounded with walls, and defended by two small forts. It was anciently a considerable town. In the year 1120, the bishopric was removed hither from Jaden. In 1352, it fell into the hands of the Venetians; but the Turks wrested it from them, after which they were several times driven out; but as often recovered it.

Clinowo, or Kliuno, is a well built town, on a rising ground, which the Turks in time of war have generally made their place of rendezvous, and the depository of their magazines of provisions and military stores.

Master, an open town on the Visera, over which is still to be seen an old Roman bridge of stone.

Herzegowina, or Arcegovina, a spacious and well fortified town, in which the Turkish beglerbeg resides.

Popocco, a small district, difficult of access, on account of its situation between two long mountains; but remarkably fruitful in corn, wine, and excellent fruits, though the lands are generally over-flowed in autumn: but the inhabitants of this district in the year 1694, put themselves under the protection of Venice.

SECT. XVII.

Of TURKISH ILLYRICUM, including BOSNIA and SERVIA.

Their Situation, Extent, and Produce. Of the Inhabitants, their Language, Religion, and Learning. With an Account of the principal Places in these Provinces; and a particular Description of Belgrade.

THIS country extends from Sclavonia to Romania and Bulgaria, between Croatia, Dalmatia, and the Danube. It has several mountains, among which the Argentorato is particularly remarkable. Its navigable rivers are the Danube, which constitutes the northern boundary of Servia, the Morau, the Ibar, the Drino, the Bosna, the Verbas, and the Save.

The country is proper both for grazing and agriculture, producing grain, wine, and provender for every kind of cattle; and the mountains, particularly those of Bosnia, contain silver.

The inhabitants are of Sclavonic extraction, and from the middle ages have been divided into Servians, Bosnians, and Ratzians; though without any remarkable difference in their speech and manners. They speak the Sclavonian language, which nearly resembles that of the Russian. As to their religion, they are of the Greek church; but Mahometanism has gained considerable ground among them, which is doubtless owing to their being almost absolute strangers to learning. Their letters for writing are the Ciruli, which are also used by the Russians.

Both Bosnia and Servia were antiently united to Hungary, by what was then called a perpetual compact. The former was governed by a ban, and the latter by a despot, or prince; but now both form a province of the Turkish empire, which appoints beglerbegs and fangiacs over them.

Bosnia, also called Rama, derives both these names from the rivers Bosna and Rama, or perhaps the former from the nation of the Bosneni. This country is bounded on the north by the river Save, which separates it from Sclavonia; to the eastward by the Drino, which divides it from Servia; on the south by a chain of mountains which separates it from Dalmatia; and to the westward by the river Verbas, which divides it from Croatia. It is forty Turkish miles in length, fifteen in breadth, and consists of three fangiacships, in which are several towns, of which little more is known than their names.

Servia is so called from the Serbii, and is sixty Turkish miles in breadth, and thirty in length. At the treaty of Passarowitz, concluded in the year 1718, the greatest part of it was ceded to the Roman empire; but at the peace of Belgrade, in 1739, the Imperialists were obliged to restore it to the Ottoman Porte. It was antiently divided into Proper Servia and Rascia; and to the former, which is in the upper part towards the Danube, belongs the bannat of Masovia; it at present consists of four fangiacships.

The fangiacship of Belgrade lies between the rivers Drino, Save, and the Danube, and contains no other place worthy of notice but its capital of the same name.

The city of Belgrade, the antient Alba Græcorum, is a celebrated and important fortress, situated at the conflux of the Save and the Danube, two hundred and fifty miles from Vienna, and four hundred and fifty-five from Constantinople, in longitude twenty-one degrees east of London, and in forty-five degrees ten minutes latitude. It was formerly accounted the barrier and key of Hungary, to which it was first annexed by the emperor Sigismund. In the years 1440, 1456, and 1494, it was in vain besieged by the Turks; but in 1521 they took and kept it in their possession till the year 1688, when the Hungarians recovered it. In 1690, it fell again under the Turkish yoke, from whence it was unsuccessfully attempted to be wrested in 1693; but in 1717 accomplished. The Hungarians were, however, again obliged to evacuate it in 1739, though not till they had demolished all its outworks, leaving nothing standing but the old walls, and some fortifications inseparable from them.

This city is, however, still large, strong, and populous, and enjoys a considerable trade. It is built on a hill after the antient manner, and encompassed by a double wall, flanked with a prodigious number of towers. The only place not defended by either of the above rivers is fortified with a castle, built with square stones, situated on a rising ground. The suburbs are very extensive, and extremely resorted to by Turkish, Jewish, Greek, Hungarian, and Sclavonian merchants. The city is extremely well seated for commerce; for, besides the Danube and the Sava, which wash its walls, it is but a small distance from the place where the Tibiscas falls into the Danube; nor is it far from the Morawa to the east, and the Drowa towards the west; and as the Danube falls into the Black sea, this city may easily carry on a considerable trade with the most distant countries; accordingly it is the chief staple town in these parts, it being

being traded to by the Ragufans, by the merchants of Vienna, who have factories here, by the Armenians, and the Jews, who are very numerous in this city. The former have a church, and the latter at least one synagogue. The shops are small, and the sellers sit upon tables, from whence they sell their goods out of a window or door, the customers seldom going in. Here are two bazars for their richest commodities, and two exchanges, built with stone, crowded with merchandize. They have also a handsome caravanfera, built by a grand vizier, and a college for young students. This city is the see of a bishop, formerly suffragan to the bishop of Buda.

The second fangiacship is that of Cemender, among the remarkable places of which is,

Tachtali, a dangerous part of the Danube, where the water, after falling from a rocky precipice, forms a whirlpool. This is occasioned by the nature of the two shores, a high rock on the Servian side projecting a great way into the stream, which rushing against it with great impetuosity, recoils as it were against the opposite rocks on the shore of Walachia; so that a vessel missing the right channel is in great danger of being overfet. Beyond this place the Danube, slackening its course, expands itself into a wide curve. At a small distance farther lies Demikarpi, or Iron Gate, commonly called *Cataractæ Danubii*, which is likewise the name of the neighbouring country, where the Danube enters a streight between mountains, and pursues its course over a rocky bottom. The waves and agitations caused by the frequent obstructions of the stream, which is here very rapid, toss a ship with such violence, that unless the steersman be very expert, and well acquainted with the place, the vessel is in great danger, especially in going upwards, which can only be done by the help of sails. In 1737, the Imperialists were obliged to sink their ships here for want of wind to waft them against the stream. In this narrow pass the houses stand within a palisadoe, and are said to have been formerly barricadoed with an iron chain, which first gave rise to the appellation of the Iron Gate.

The next town we shall mention is Fetislan, called in the Rascian tongue Kladowo, a considerable town on the Danube, within a little of which terminates the chain of mountains, and the Danube runs between two plains.

The fangiacship of Kratowo contains the following places:

Nissa, once the capital of Servia, is situated in a fine plain, on the river Nissava, in a very good air, and so fruitful a soil, that the great plenty is hardly credible. There are several fine mosques, two public baths, and several fountains. The town is fortified with a wall and rampart; but in 1737, it was taken by the Hungarians, who lost it the year following. The lady Wortley Montague, in a letter to queen Caroline, when she was princess of Wales, gives a dreadful account of all that part of Servia through which she passed; and observes, that the desarts of Servia are almost overgrown with wood, though a country naturally fertile. The inhabitants are industrious; but the oppression felt by the peasants is so great, that they are forced to abandon their houses, and neglect their tillage; all they have falling a prey to the janizaries, whenever they please to seize upon it. Mr. Wortley had a guard of five hundred of them, and she was almost every day in tears at beholding their insolence in the poor villages through which she past. On speaking of the fertility of the soil at Nissa, she says, "I was certainly assured, that the quantity of wine last vintage was so prodigious, that they were forced to dig holes in the earth to put it in, not having vessels enough in the town to hold it. The happiness of this plenty is scarce perceived by the oppressed people. I saw here a new occasion for my compassion: the wretches that had provided twenty waggons for our baggage from Belgrade hither, for a certain hire, being all sent back without payment, some of their horses lamed, and others killed, without any satisfaction made for them. The poor fellows came round the house weeping and tearing their hair and beards, in a most pitiful manner, without getting any thing but drubs from the insolent soldiers. I cannot express how much

"I was moved at this scene. I would have paid them the money out of my own pocket with all my heart; but it would only have been giving so much to the aga, who would have taken it from them without any remorse."

Procupia, or Procopia, a pretty town thus named from the bishop Procopius, is called by the Turks Urchup.

The fourth fangiacship is that of Scupi, in which is Uscup, Scupi, or Scopia, an open, but large, well-built town, on the confines of Albania and Bosnia, and is the residence of an archbishop. It is seated in a pleasant and plentiful country, partly hills and partly plains, on the river Vardar, or Axios, fifteen miles to the west of Nissa; it has a great trade, and is adorned with fine houses, many mosques, and delightful walks near it. Among the mosques is one built upon a hill, and adorned with a spacious portico, supported by four marble pillars. There is here a fine bridge of twelve arches over the Vardar, and near the city is a noble aqueduct of stone conveyed over a valley between two hills, and supported by two hundred arches. This is supposed to be very antient, and performed by the Romans. The city carries on a considerable trade between Bulgaria, Macedonia, Belgrade, &c. particularly in tanned leather, which here employs above seven hundred tanners.

We shall now proceed to those countries in Europe that are tributary to the sultan, and under his subjection.

S E C T. XVIII.

Of W A L A C H I A.

Its Situation, Extent, Climate, Soil, and Rivers. The Origin, Language, and Religion of the Inhabitants. Their History, and a concise Account of the most considerable Places in the Country.

WALACHIA is a pretty large province, separated from Moldavia by a chain of mountains and the river Sereth. It is about two hundred and ten miles from east to west, and about a hundred and five from north to south; but this country being of a triangular form, these dimensions can only relate to a very small part of it.

The air is temperate, the soil very fruitful, particularly in grain, wine, and melons: it is also fit for grazing, and the country is famed for excellent horses.

Walachia is watered by a considerable number of large and small rivers, most of which run from north to south, discharging themselves either immediately into the Danube, or doing it in conjunction with other rivers. The principal of these are the Aluta, which rises in the mountains of Transylvania, dividing Walachia into two unequal parts, namely, the east and west; the Jalonitz, which has also its source in the borders of Transylvania; and the Sereth, or Strech, the boundary on the side of Moldavia.

The Walachians who inhabit this country are descended from an old Roman colony settled here by the emperor Trajan. This appears not only from their language, which is a barbarous Latin, but from their customs and manner of diet: as for instance, their thick pottages and onions, of which they are extremely fond, their dress, and their great regard for the Italians, their language, and whatever belongs to that country. They are, however, intermixed with the Sclavi and Pazinacitæ. But, to shew that they are descended from the Romans, they call themselves Romunii.

Historians are far from being agreed about the derivation of the word Walachian; and we shall not here enter into their various opinions, but shall only observe, that the word Wlach in Sclavonic signifies an Italian, as does also the word Welcher.

The Walachians profess the Greek religion, and as in writing they use the same letters with the Russians, so they agree with them in all their religious ceremonies. The common people are wretchedly ignorant; and even the highest attainments to which the ecclesiastics themselves aspire, are seldom more than preaching and singing well. They have a kind of university at Buckereft,

to which they go in order to learn a polite behaviour, the elegancies of the Walachian tongue, and the ceremonies of the church. People of rank are so fond of Italian, that they apply themselves more to it than to their native language, and generally send their sons to study at the university of Padua. A great number of Mahometans live intermixed with the Walachians.

With respect to the history of these people, the Romans, after obtaining a decisive victory over Decebalus, king of Dacia, made themselves masters of his kingdom. Afterwards Trajan sent thither several Roman colonies, who not only cultivated their lands, but built towns, which they embellished with noble edifices. His successor, however, transplanted the greatest part of them into the neighbouring countries, where mingling with the Bulgarians, Thracians, Servians, and Ligurians, they learned to speak a new language, or jargon. These kingdoms, which lie on the Danube, afterwards constituted part of the dominions of the emperors of the East. At length the Walachians moved farther to the north towards the borders of Podolia and Russia, where they applied themselves to agriculture and the breeding of cattle. The conversion of the Bulgarians and their neighbours to Christianity was followed in the ninth century by that of the Walachians, who embraced the doctrines of the Greek church. Towards the beginning of the twelfth century a numerous colony of Walachians, under the conduct of one Nigers, or Negrovot, for the sake of pasturage, religion, and other motives, quitting Transylvania, passed over the mountains, and settled in Modern Walachia, founding the towns of Tergovisto, Buckereft, Longenau, and Pitefto St. Georgi, where they chose their own princes, whom they stiled waywodes, or despots. At length the kings of Hungary becoming powerful, made several attempts against the Walachians, and obliged them, in the fourteenth century, to become tributary to him. But in the year 1391, and 1394, they were greatly harrassed by the Turks, who, in 1415, laid the whole country waste with fire and sword, and compelled the waywode to pay them an annual tribute, which was continued till the year 1608, when the Walachians put themselves under the protection of the emperor of Germany, who at length, by the treaty of Carlowitz, resigned them up again to the Turks. In the beginning of the present century, they suffered various calamities by the plague, war, and many revolutions among their princes. At the treaty of Passarowitz, in 1718, the western part of Walachia, as far as the river Aluta, was ceded to the emperor, but in 1739 was lost again.

This country is governed by a waywode, or prince, also stiled the hospodar, who is a vassal of the Ottoman Porte, and whose annual tribute generally amounts to fifty-eight or sixty thousand ducats.

The arms of Walachia are a black eagle standing on a mount, and in its beak a cross erect, with the sun on one side, and on the other the moon, in a field, argent.

It has been already observed, that the river Aluta divides Walachia into two parts. In the western part, called the bannat of Severin, are the following places:

Severin, a little town on the Danube, but formerly fortified, and the capital of a bannat, received its name from the emperor Severus, its founder.

Upon the Danube are seen the remains of the stone pillars of a bridge, which was probably that which the emperor Trajan built over the Danube, in order to attack Decebalus, king of the Dacians, with greater advantage. According to count Marfigli, the river here is not above a thousand yards over, and the two first piers of the bridge standing seventeen fathoms and a half asunder, he concludes there must have been twenty-three in all; and that the whole length of the bridge was 443 fathoms. He also asserts, that the masonry of the piers was of common quarry stone, lined with bricks; and that probably the twenty-two arches, with all the upper part of the bridge, were of oak. The emperor Adrian caused not only the upper part of the bridge to be removed, but demolished all the masonry above the water.

Walachia, on the other side of the river Aluta, contains the eastern part of the country, in which are,

Langenau, in Latin Campus Longus, a genteel populous town, which suffered greatly in the war with the Turks in 1737 and 1738.

Tergovisto, or Tervis, the capital of Walachia, is situated on the river Jalonitz. It has some fortifications, with a fine palace belonging to the waywode, and is a town of good trade. It is, however, surrounded by marshy grounds, which, while they render it of difficult access, make the air unhealthy.

Buckereft, a fortified city on the river Dembrovitz, is situated thirty miles to the south-east of Tergovisto; it is the usual residence of the waywode, and an archiepiscopal see. Here is also an academy for the sons of persons of quality.

SECT. XIX.

Of MOLDAVIA.

Its Name, Situation, Extent, Climate, Soil, Produce, and Rivers. Of the Inhabitants, their History, Government, Arms, and principal Towns.

THIS country takes the name of Moldavia from the river Moldaw, which runs from the upper parts, and falls into the Sereth. It is bounded on the north by Poland, on the east by Oczakow Tartary and Bessarabia, on the south by Walachia, and on the east by Transylvania. It extends about a hundred and seventy miles from the river Sereth to the Niefter; but its length, from south to north, is only about two hundred and ninety.

The air of this province is wholesome; but a considerable part of the eastern division lies uncultivated, and chiefly consists of deserts, and the western is very mountainous; but the middle part is fruitful in corn, pulse, honey, wax, &c. but is chiefly remarkable for the great number of horses bred there.

Its principal rivers are the Sereth; the Pruth, which has its source in the borders of Transylvania and Poland, running through Moldavia from north to south; and the Niefter, which forms the boundary towards the north and east. These three rivers receive several small streams in their course, and the two first fall into the Danube or Ister, which is the boundary to the southward; but the last discharges itself into the Black sea.

The inhabitants are of Walachian extraction, and profess the religion of the Greek church; but many of them are Russians, Poles, Rascians, Armenians, and Mahometans.

Towards the close of the twelfth century a Walachian colony from Transylvania settled in this country, under Bogden, their leader, who established their civil and ecclesiastical government; and, for the support of the latter, obtained an archbishop and other ecclesiastics from the patriarch of Constantinople. He was the first prince of Moldavia, and laid the foundation of the principal towns; for which reason the country was originally called from him Bogdania. The increase of the king of Hungary's power was a misfortune to this country, the inhabitants, after several resolute struggles, being made tributary to that monarch in the fourteenth century. But before that period they had been rendered tributary to the Turks, and soon became so again. In 1686 the Poles over-ran the country, and took the chief cities, which obliged the inhabitants to put themselves under the protection of the German empire; and, at the treaty of Carlowitz, it was agreed, that the Poles should retire, and this country again become tributary to the Ottoman Porte.

This country has a waywode, or prince, of its own, who is stiled hospodar, and is a vassal of the Grand Seignior, to whom he is obliged to pay an annual tribute.

The Moldavian arms are an ox's head, sable, in a field, or.

Moldavia is divided into Upper and Lower.

Upper Moldavia is bounded towards the east by the river Niefter; on the north partly by that stream, and partly by Poland; and on the westward by Transylvania. In the northern part of this division reside the Lip Tartars.

In this division are the following places:

Chotzin,

Chotzin, or Coczim, a town situated on the Niefter, well fortified both by nature and art, and belonging to the Turks. In the years 1621 and 1674 the Turks were defeated here by the Poles. In 1739 the Russians made themselves masters of it, having first beaten the Turks out of the intrenchments, which they had thrown up near the fort; but the Turks soon recovered it again.

Soczowa, or Sotshowa, a small town on the river Sereth, formerly the capital of the country, and the usual residence of the hospodar.

Lower Moldavia borders to the west on the mountains of Transylvania, which run along the road called Tetras, and belong to Moldavia and Walachia. It is bounded on the south by the Danube, on the south-east by Bessarabia, and on the east by the Niefter.

This division contains,

Jassy, the capital, which is a considerable city, and the residence of the hospodar, is seated on the river Pruth, and is a spacious well fortified place, defended by a castle; and is built in a country abounding with wine. In the years 1711, and 1739, it was taken by the Russians; and, in 1753, the whole city, with the palace of the hospodar, some popish convents, and a Lutheran church, which had been newly built, were all destroyed by fire.

Faltshii, a town situated also on the Pruth, is remarkable for having in its neighbourhood ruined walls and foundations of houses, which run in straight lines amidst very thick woods. These are supposed to be the ruins of the antient and large city of Taiphali mentioned by Herodotus, out of the ruins of which Faltshii was built.

S E C T. XX.

Of the several Colonies of Tartars tributary to the Turks, and their different Districts; including an Account of the Tartars of Bessarabia, the Oczakow, the Nojay, and the Crim Tartars; with an Account of their several Towns, and of the Peninsula of Crimea, or Crim Tartary.

FROM the northern branch, through which the Danube enters the Black sea to the river Don, is a winding tract of land, which extends along the Black sea and the sea of Asoph, and is inhabited by several tribes of Tartars, which are generally comprehended by geographers under the title of European Tartars; but there being many other Tartars in Europe, this term is by no means proper. The Tartars made themselves masters of this country in the beginning of the thirteenth century, and some of them still wander about in hords or clans, while others are settled in towns and villages. Some are also immediately dependent on the Ottoman Porte, and others subject to the Crim, who is himself a vassal to the Grand Signior. Geographers vary greatly in their division and the extent they give to these Tartarian districts; for the accounts we have of them are very imperfect. In describing this country along the Black sea, and the sea of Asoph, we shall begin at the west, at the mouth of the Danube, and proceed according to the principal rivers which intersect the country, mentioning what is most remarkable in the several districts formed by those large streams, the Niefter, the Nieper, and the Don. Thus tracing the country from the west, we meet with

Bessarabia, which lies on the Black sea, between the north branch of the Danube and the Niefter, and is by the Turks called Bujack, or Budjiack. The inhabitants still rove from place to place along the Niefter. Their usual food is the flesh of their oxen and horses, cheese, and milk, particularly that of mares.

The chief towns are,

Bender, a Turkish fortification on the Niefter, formerly called Tizene; but being made over to those Turks by one of the princes of Moldavia, they gave it the name of Bender, that is, a pass; it is a small town, but has always a basha for its governor. Warnitz, near this town, is remarkable for being the place where Charles XII. of Sweden, broke up his camp in 1709, and continued till the year 1713, when the Turks were obliged to make use of force to get rid of him.

There are several other towns in this district; but being inconsiderable places, do not deserve being particularly mentioned.

The country between the Niefter and Nieper, by some called Oczakow Tartary, is inhabited only along those two rivers, and near the sea; the other parts being quite waste, and are therefore called the Desert Plains. This plain, however, affords good pasturage, but has not a single tree. The most remarkable place in this district is,

Oczakow, a very strong town, situated at the influx of the Nieper into the Black sea. It lies on the declivity of a mountain, and has a castle above it. When it was invested by count Munich, in 1737, its fortifications were in excellent order, and its garrison consisted of a large body of chosen Turkish troops; but the count, being compelled by want of fodder for the horses and other cattle, risked an assault, and carried it the third day after his opening the trenches. The Russians held the place till the following year, when they evacuated it, after having demolished the works.

The country between the Nieper and the efflux of the Don, contains,

The Lesser Nogay Tartars, who inhabit the main land along the Black sea and the sea of Asoph, and the rest of them belong to Asia. They wander from place to place, each hord or tribe keeping at thirty hours distance, and frequently not so far from each other. These people seldom apply themselves to agriculture. Among them, as well as the Crims, horse-flesh is a favourite food. But however savage this may make them appear, they are so hospitable, that the pleasure they receive from entertaining a traveller and his horse, is with them a sufficient reward; and if they are presented with a little tobacco, or any thing else, they receive it with abundance of thanks, and never fail to make a return. They profess the Mahometan religion, and are governed by murses, or beys, of their own nation, or by such as the kan of Crim Tartary, their sovereign, appoints from among them. With respect to the limits of this district, which it has been said extends from the Nieper to the Don, it was agreed at the treaty of Belgrade, in the year 1739, that a line should be drawn from the river of Zalimy to the river Berda, which falls into the sea of Asoph. The district within this line continues under the kan of Tartary, who enjoys a much larger district northwards, but is dependent on Russia.

In the first district on the Black sea is Kinburn, a Turkish fortification, which lies opposite Oczakow, and east of the Nieper, where it discharges itself into the Black sea. The Russians took this place, and blew up the fortifications in the year 1736; but the Turks thought it worth rebuilding. There are also several small places between the Nieper and the Black sea.

The Crim peninsula, the antient Chersonesus Taurica, is called in the Turkish maps Kiram Athasi, or the Crim island, which is nearly of the same figure with the Morea, and was supposed by the antients to have almost the same extent. It is surrounded by the Black sea and the sea of Asoph, except at the narrow neck of land by which it is joined to the continent. The soil in many parts produces all kinds of grain, wine, &c. but the Tartars seem to despise agriculture, and leave it to their slaves and to strangers. The favourite food of these Tartars is horse-flesh, milk, and cheese; bread being little used among them. Of all the Mahometan Tartars, these have the nearest resemblance to the Calmucs.

The inland country of this peninsula was antiently possessed by the Scythians, who extended themselves northwards beyond Perekop, westward to the Nieper, and eastward as far as the Don. The western and southern coasts were antiently inhabited by some Greek colonies, of which the town of Chersonesus was the most powerful. The east side of the Crim, as far as the Don, and the opposite country, or the tract from the Don along the sea of Asoph, antiently called the Palus Mæotis, to the Black sea, and Mount Caucasus, was under the kings of the Bosphori-Greeks, who were thus called from the streight of Bosphorus. The Scythians proving troublesome neighbours to the Greeks, they solicited the assistance

of Mithridates, king of Pontus, who at last drove the Scythians out of the peninsula, forming the kingdom of Bosphorus, which comprehended the whole peninsula and the country facing it eastward to Mount Caucasus. In the reign of the emperor Dioclesian the Sarmatæ were solely possessed of this kingdom, except the Goths having seated themselves on the west side of the peninsula, and along the tract of land which lies to the northward along the Don. This peninsula afterwards came under the dominion of the emperors of the East, though it was partly shared by the Huns, who were succeeded by the Cozars, as these were by the Polowzers. About the end of the twelfth century, the Genoese, after making themselves masters of the Black sea, and all its harbours, also settled in this peninsula. In the thirteenth century, the Tartars dispossessed the Polowzers of their country, and particularly of Crimea; but the Genoese forts and castles baffled their undisciplined fury, and especially the town of Costa, which held out till the year 1471, when it was taken by the Turks, who also reduced the whole peninsula, and appointed a kan over it. In 1698 the Russians made an attempt to conquer this peninsula, but gained only Perekop; and in 1736 they penetrated a second time into Crimea, under the conduct of count Munich, marched over the line which the Perekop Tartars had thrown up across the isthmus, took Perekop, and opened a way into the peninsula. In the years 1737, 1738, and 1739, the Russians renewed their enterprizes against Crimea with such success, that half of the peninsula was ravaged by them and the Tartars; while many of the inhabitants abandoned the country, and others perished by famine.

Crimea has its own kan, or prince, who styles himself sovereign kan of Lesser Tartary, though he is really a vassal of the Ottoman Porte; and, on a proper summons, must take the field with a considerable body of auxiliaries. The eldest son, who is the kan's presumptive heir, has the title of Sultan Galga; the second son is called Or Beg, that is, lord of Or, or Perekop; the third is styled Noradin Beg, &c.

The peninsula of Crim has many great and small villages, and likewise contains several large but ill built towns; among these are,

Perekop, a fortified town on the isthmus which joins the peninsula to the continent, and has always been esteemed the key to the whole empire. Its name, which is Slavonian, signifies a cut made through a place, and is derived from a ditch antiently dug across the isthmus for the security of the peninsula, which has been repaired from time to time, and of late fortified. It is defended by a castle, but the houses are very mean. In the year 1638 and 1736, it was taken by the Russians; at the last of which times the whole Turkish garrison, consisting of two thousand five hundred and fifty-four men, were made prisoners of war. Though the Russians demolished the place, the Tartars took the pains to rebuild it. In the year 1738, it was again taken by the Russians, but they soon lost it.

Koslow, a town situated on a point of land which projects into the sea of Asoph on the western side of the peninsula, and has a fine harbour; it is defended by a stone-wall, strengthened by towers, and carries on a

very considerable trade. The inhabitants consist of Tartars, Turks, Greeks, Armenians, and Jews. The Turks import rice, coffee, dried figs, raisins, dates, cloth, and silk stuffs; and, in return, receive corn and slaves. Both the garrison and Turkish inhabitants abandoned the town in the year 1736, when the Russians took it without opposition.

Bakshisarai is an open town, notwithstanding its being the residence of the kan. It is situated on the west side of the peninsula near the sea, between two hills, which serve the town instead of walls. Its inhabitants are Tartars, Armenians, Greeks, and Jews; and the houses the best built of any in the whole country. The kan's palace is a large and irregular structure. The Russians made themselves masters of this town in the year 1736.

Karabazar is a large town that carries on a considerable trade; yet its houses are low wooden buildings; but it has four mosques built with stone. The inhabitants are Tartars, Turks, Armenians, Greeks, and Jews. The horse-fair held in this place is the most considerable in all Crimea. This town was laid in ashes by the Russians in the year 1737.

Kersh, or Gerh, the antient Panticapæum, since called the Bosphorus, is a considerable town, situated on a steep mountain near the streight formerly called the Bosphorus, but now termed by sailors the streights of Caffa. It commands the entrance into the Black sea; and is not only surrounded with a high wall, but defended on the south-east by a castle with seven towers; and at the harbour is a mole built with stone. The far greatest part of the houses are likewise built of stone, and have flat roofs. In this town are twenty-two Turkish mosques, and as many Greek churches.

The Turks have a castle on the streight near Kersh, with a harbour, but it is not fit for ships of burthen. They have also the town of Caffa, or Keffeh, the antient Theodosia, a large trading sea-port, situated on the east of the peninsula, supposed to have been built by the Greeks in the fifth century. In 1226, the Genoese having got this place into their possession, they enlarged and fortified it; but in 1297 the Venetians drove them from thence: they soon, however, recovered it again; but, in the year 1474, the Turks took it from them. While this town was in the possession of the Genoese, its commerce rose to such a height, that it exceeded that of Constantinople itself; but, on its falling under the Turkish yoke, its trade greatly declined, and now only consists in slaves brought hither for sale by the Crim and Cuban Tartars, the Georgians, and Mingrelians. The inhabitants consist of Turks, Jews, Greek, Catholic, and Armenian Christians, &c. The Christians constitute the majority of the inhabitants, and enjoy a most perfect freedom with respect to religion. Here are still the descendants of several noble families of Genoa. The town, which is the largest in all Crimea, contains about five or six thousand houses, and is constantly well garrisoned. To the north-west are some high mountains, at the foot of which the town stands in a very delightful and convenient situation; but the harbour, besides having a difficult bar, affords but little shelter in a south-east wind.

C H A P. II.

O F R U S S I A.

S E C T. I.

Of the RUSSIAN EMPIRE in general.

Its amazing Extent : some general Observations on its Climate in different Parts ; and the Progress of the Seasons throughout the Year.

THE Russian empire is of an amazing extent : towards the north and east it is bounded by the main ocean, and towards the west and south its limits are settled by treaties concluded with several far distant powers ; with Sweden, the Poles, the Turks, with the Persians, and with the Chinese, by whose dominions this immense empire is bounded. Voltaire justly observes, that “ it is of greater extent than all the rest of Europe, “ or than the Roman empire in the zenith of its power, “ or the empire of Darius subdued by Alexander ; for it “ contains more than eleven hundred thousand square “ leagues. Neither the Roman empire, nor that of the “ Macedonian conqueror, comprized more than five “ hundred and fifty thousand each ; and there is not a “ kingdom in Europe the twelfth part so extensive as “ the Roman empire. In length, from the isle of Dago “ as far as its most eastern limits, it contains very near “ a hundred and seventy degrees ; so that when it is “ noon-day in the west, it is very near mid-night in the “ eastern part of this empire. In breadth it stretches “ from south to north three thousand wersts, which “ makes eight hundred leagues.”

As this empire consists of a great number of provinces, many of which are very extensive, both the soil and temperature of the air must be extremely various in different parts. In those which lie beyond the sixtieth degree of latitude, there are few places where corn will grow to maturity ; and in the northern parts of the empire, which reach beyond the seventieth degree, no garden-fruits are produced, except in the country about Archangel, where many bushes and shrubs grow spontaneously, and yield several sorts of berries : horned cattle are also bred, and there are plenty of wild beasts and fowls, and several sorts of fish in the neighbourhood of that city.

In the provinces situated in the middle of the empire, the soil produces most kinds of trees and garden-fruits, corn, honey, &c. They are likewise well-stocked with horned cattle ; the woods abound with game ; the rivers are navigable, and full of the best sorts of fish.

In the southern provinces the climate is hot ; and though in some parts there are many barren wastes, yet in others the land is covered with verdure and flowers. Tobacco, wine, and silk, might be there produced, as the two first are at Astracan and the Ukraine ; and they are well watered with rivers, which afford plenty of fish ; nor are they destitute of game in proportion to the extent and number of the woods.

In the middle, and more particularly in the northern parts of the empire, the cold is very severe, and the days extremely short in winter ; but the summers are warm and delightful, and even in the shortest nights the twilight is very luminous. At the winter solstice, when the day is at the shortest, the sun rises at Archangel at twenty-four minutes after ten in the morning, and sets at thirty-six minutes after one. At Petersburg the sun rises at fifteen minutes after nine, and sets at forty-five minutes after two ; but at Astracan the sun rises at forty-eight minutes after seven, and sets at twelve minutes after four.

At the summer solstice, when the day is at the greatest length, this order is reversed, and the sun rises at Astracan at twelve minutes after four, and sets at about forty

minutes after seven ; and at Archangel rises at thirty-six minutes after one, and sets at twenty-four minutes after ten.

It is a common observation, that the eastern countries are much colder in winter, and hotter in summer, than the western that lie in the same latitude : this is particularly true with respect to Russia, for the river Neva, at Petersburg, is in some years covered with ice so early as the twenty-fourth of October ; and in other years, when latest, about the twenty-second of November ; but it generally thaws by the twenty-sixth of April, old style, which it is never known to exceed.

The reader cannot fail of being pleased with seeing here the progress of the seasons at Petersburg, which is situated in the fifty-ninth degree of latitude, from an author of such acknowledged veracity as Jonas Hanway, Esq. February generally brings with it a bright sun and a clear sky, every object seems to glitter with gems, and the nerves become braced by the cold. There is then no small amusement in riding in sledges upon the snow, to those who, from the length of the winter, have forgot the much superior pleasure which nature presents when clothed in all her verdure.

March is frequently attended with showers, which with the heat of the sun, penetrates the ice : this is generally three quarters of a yard thick on the Neva, and in some great rivers to the north-east much thicker. This renders it like an honey-comb, and about the end of that month it usually breaks up.

The month of April is frequently very warm ; summer seems to precede the spring ; for it is sometimes the first of June before any considerable verdure appears, and then the intense heat brings it on so fast, that the eye can discover its progress from day to day. Till the middle of July it seems to be one continued day, the sun not intirely disappearing above two hours in the twenty-four ; but the delight which this season naturally affords, is considerably abated by the extreme heat of the weather ; however, a week seldom passes without the air being refreshed by southerly and westerly winds, which often bring gentle showers. Our author, who resided about five years in this city, once experienced a delightful autumn to the end of September ; but this rarely happens : August closes the scene, so that there are hardly above three months of summer.

September generally brings rain and frost ; the severity of both is increased in October, and in November the Neva is always frozen. Then comes on the season for the easy and speedy conveyance on the snow, which brings fresh provisions to market a thousand English miles by land, and the beef of Archangel is often eaten at Petersburg. In December and January the cold is so very intense, that the poor who are overtaken by liquor, or exposed to the air in open places, are frequently frozen to death. But the abundance of birch and alders with which the Russians are supplied, and the commodiousness of their stoves, enable them to introduce any degree of heat into their houses.

However, not one-tenth of the Russian empire is sufficiently peopled, and not a tenth part of it properly cultivated : for, notwithstanding its prodigious extent, the number of inhabitants who pay the poll-tax, is computed only at five millions one hundred thousand, and the rest, including the females, amounts to about ten millions, exclusive of the inhabitants of the conquered provinces.

As the greatest part of this empire is situated in Asia, and has already been described in treating of Siberia and Russia, the western part of that empire, therefore, now only remains to be treated of.

S E C T. II.

Of the Situation and Extent of Russia, its Rivers and Lakes.

THE boundaries of this part of the Russian empire towards the east, are indeed the same with the limits between Europe and Asia. It extends on the east to the Wercoturian mountains, and to part of the Wolga, which separate it from Siberia; on the south it is bounded by the river Don, and a line drawn from the Nieper to the mouth of the Don, at its entrance into the sea of Asoph; on the west by the Nieper, which separates it from Poland, the gulph of Riga, the gulph of Finland, Sweden, and Swedish Lapland; and on the north by the Frozen Ocean.

The principal rivers of Russia are as follow:

The Wolga, in Latin Volga, which has its source in the forest of Wolconski, and is one of the largest rivers in the world; for it runs a course of above two thousand miles before it falls into the Caspian sea. Its banks are generally fertile, and though not sufficiently cultivated, on account of the frequent incursions of the Tartars; yet the soil naturally produces all kinds of excellent herbs, and in particular asparagus of a very extraordinary size and goodness. It is observable, that most of the oaks in Russia grow in the countries watered by this river. At Iwer, a town little more than one hundred and twenty miles from its source, the Wolga is navigable for large ships; and towards the end of the spring this river is so swelled by the melting of the ice and snow, as to cause great inundations; particularly in the months of May and June. The masters of the vessels which sail down the Wolga to Astracan, carefully observe this season, as at that time they have not only the opportunity of a safe passage over the shallows; but also over several flat islands which then lie at a considerable depth under water. Trees are often torn away by the roots from the banks of this river by the violence of the current, and the anchors of the vessels are frequently so entangled amongst them, that there is a necessity of cutting the cables, so that many anchors are supposed to lie at the bottom. The Wolga abounds with a fine fish called beluga, which is about eight or ten feet in length. It receives several considerable rivers, among which are the Occa and Cama, and discharges itself through several mouths into the Caspian Sea, by which means it forms many islands.

The Don, the Tanais of the ancients, is called Tuna or Duna by the Tartars, and has its source not far from Tula in the Iwano Ossero, or St. John's lake. It first runs from north to south, and after its conflux with the Sosna, directs its course from west to east, and in several large windings, again runs from north to south; but at length dividing into three channels, falls into the sea of Asoph. The waters of the Don are thick and chalky, consequently not very wholesome to drink. This river is very shallow in summer, when it is also full of sand-banks; it, however, affords plenty of large and small fish. The Don in its course approaches so near the Wolga, that in one place the distance between them is but one hundred and forty wersts, or about eighty English miles.

The Dwina is a very large river, the name signifies Double, it being formed by the conflux of the Sukona and the Yug. This river divides itself into two branches or channels near Archangel, from whence it runs into the White Sea.

The Nieper, the ancient Borysthenes, arises from a morass in the forest of Wolconski, about one hundred and twenty miles above Smolenski, and forms several windings through Lithuania, Little Russia, the country of the Zaporog Cossacs, and a tract inhabited by the Nagaian Tartars; and after forming a marshy lake of sixty wersts in length, and in many places two, four, or even ten wersts in breadth, discharges itself into the Black Sea. The banks on this river are on both sides generally high, and the soil excellent; but in summer the water is not very wholesome. The Nieper has no

less than thirteen water-falls within the space of sixty wersts; yet in spring, during the land-floods, empty vessels may be hauled over them. It abounds with sturgeon, sterled, carp, pike, karaush, &c. There is but one bridge over this river, and that is a floating one at Kiew, one thousand six hundred thirty-eight paces in length. This bridge is taken away about the end of September, to give the flakes of ice a free passage down the river, and is again put together in spring. There are to be seen on this river a great number of mills erected in boats.

We shall now mention the principal lakes in this part of the Russian empire, which are,

The lake of Ladoga, situated between the gulph of Finland and the lake of Onega, is one hundred and fifty miles in length, and ninety in breadth. It is esteemed the largest lake in Europe; and is supposed to exceed any other for its plenty of fish, among which are also seals. This lake is full of quick-sands, which being moved from place to place by the frequent storms to which it is subject, cause several shelves along its course, which often prove fatal to the flat-bottomed vessels of the Russians. This induced Peter the Great to cause a canal near seventy English miles in length, seventy feet in breadth, and ten or eleven deep, to be cut at a vast expence from the south-west extremity of this lake to the sea. This great work was begun in the year 1718, and though vigorously prosecuted, was not compleated till the year 1732, in the reign of the empress Anne. This canal has twenty-five sluices upon it, and several rivers run into it. At the distance of every werst along its banks, is a pillar marked with the number of wersts; and it is the constant employment of a regiment of soldiers to keep the canal in repair; for this purpose they are quartered in several places on its banks. In summer-time it is covered with floats and vessels, which pay toll in proportion to the value of their cargo.

The lake of Onega is situated between the lake of Ladoga and the White Sea, and has a communication with the former by means of the river Swir. It is one hundred and eighty wersts in length, and about eighty in breadth; and though it has fresh water, seals are often seen in it.

The lake of Peipus in Livonia, is near seventy miles in length, and about forty miles in breadth. It abounds with fish, and runs into the gulph of Finland by the river Narva.

Medicinal and saline springs are not uncommon in Russia. Fine silver, which also yields some gold, is dug out of the mines of this country, and also exceeding fine copper, iron, and many other minerals, as isinglass and precious stones.

The most fertile part of Russia is near the frontiers of Poland, where the inhabitants are able to supply their neighbours with corn. The northern parts are not only extremely cold, but marshy, and over-run with forests, chiefly inhabited by wild beasts. Besides domestic animals, there are in Russia wild beeves, rein-deer, martens, white and black foxes, ermines and sables, whose skins make the best furs in the world; as also hyenas or gluttons, bears and wolves.

S E C T. III.

Of the Persons, Dress, and Manners of the Russians; the Houses of the common People, and their Furniture; their Food, and Fondness for strong Liquors. Their Roads, Manner of travelling, and Language.

BEFORE the time of Peter the Great, the Russians were little better than savages; but that wise prince, by incredible application, and a proper mixture of severity and mildness, wrought so happy a change in their manners, as in a great measure sets them on a level with the other civilized nations of Europe.

The Russians are for the most part of the middle stature, though many of them are tall and comely. The common people are fond of their ancient customs; and though the majority of them have been gradually brought to

to submit to modern improvements, many choose to suffer great inconveniences, and to pay additional taxes, rather than cut off their beards, and conform to some regulations with respect to religion.

The Russian women are extremely fond of paint, and consider a ruddy complexion as the very essence of beauty; so that in the Russian language, red and beautiful are synonymous terms. Even the poorer sort among the women, in order to mend their complexion, will beg money to buy paint. By this means they daub themselves so much, as to conceal the graces which nature may be presumed to have bestowed on them; for they generally profess, that if they had sufficient plumpness, they can procure themselves beauty. Persons of distinction are very fond of state and splendor. The dress of the common people in Russia is mean; they are clothed with long coats made of dressed sheep-skins, with the wool towards their bodies; their legs and feet are swaddled with a coarse cloth, secured by a cord of reeds, and their sandals are of the same materials. Their caps are lined with fur, and cover the ears and neck, as well as the head: they wear sashes round their waists, and double gloves, one of woollen, and the other of leather, which take in the hand without any distinction, except the thumb, and these are an essential part of their cloathing. However, people of any rank generally dress as we do in England, except wearing a full great coat lined with fur, with a deep quilted or fur-lined cap, when they go abroad. The women of the lower class, besides their petticoats, wear sheep-skins like the men; but those who move in a higher sphere, wear flowered silk cloaks, lined with furs, of which the most common sort is white hares. Ladies of great distinction have them lined with rich furs, and almost constantly wear them. Persons of both sexes hang on their breast a cross, which is put on when they are baptized, and this they never lay aside as long as they live. The crosses of the peasants are of lead; but those worn by persons of wealth are of gold or silver. The Russians seldom fail of bathing twice a week; for which purpose almost every housekeeper is provided with a bath; and he that has none of his own, goes to those that are public. It is remarkable, that they often sally out naked from the warm bath, run about in the cold, roll themselves in the snow, and then plunge again into the warm water; and this vicissitude of heat and cold they consider as beneficial to the constitution, by rendering them hardy and robust.

People even of the common rank salute each other with great civility; but before a Russian welcomes his guest, his visitor is obliged to make the sign of the cross, and at the same time to bow to a picture of some saint, which is so placed, as to be seen immediately at coming in. In visits of ceremony, the men and women usually welcome each other with a kiss; but those of the lower class show their profound respect for persons of high rank, by prostrating themselves on the ground before them.

The most usual method of building, both in the towns and country villages, is to lay one beam of wood upon another, and fastening them at the four corners, fill up the crevices between the beams with moss. The house is afterwards covered with shingles, and holes are made in the timber for doors and windows. A brick stove or large oven is commonly made in the houses of the peasants, and takes up a fourth part of the area: this is flat at the top, and boarded; upon it, and on a kind of shelves round the room, the whole family sleep without beds.

Their furniture consists of three benches, an oblong table, and the picture of a saint or two. Instead of candles or lamps, the Russian peasants usually burn long splinters of deal. The apartments are as black as so many chimnies; for the fire hearth being within the stove above-mentioned, which has no other vent for the smoke but into the room, the walls are covered with soot. It is no sooner dark, than the houses swarm with a species of insects called tarakans, which are a kind of goat-chaffers. The best method of keeping them out is burning a light in the room till break of day. The houses in the villages are contiguous, and built as close together as in the towns.

The insatiable eagerness of the common people after spirituous liquors and other strong drink, especially in the carnival time, is in a great measure owing to the severity of the winter, the rigorous fasts they observe, and the slender diet they live upon throughout the year. Their food chiefly consists of turnips, cabbage, pease, large cucumbers, onions, and coarse ill-tasted fish. Their drink is quas, a kind of small mead; and even among the gentry, brandy always makes a part of every repast. Among the lower class, it is generally the men who give themselves up to these excesses, though it is not uncommon to see at Petersburg a drunken woman staggering along the streets. Some authors indeed say, that drunkenness is so far from being considered as a crime, that they make it part of their religion, and that they do not think they have kept a holiday as they ought, if they are not drunk before night; and Mr. Perry affirms, that if you pass through Moscow on a holiday, you will see both priests and people lie drunk upon the ground; and if you go to help one of them up, he will tell you, by way of excuse, "It is a holiday." He adds, that their ladies of quality are so little ashamed of drinking to excess, that they will frankly acknowledge their having been very drunk, and return thanks for the favour to their friends who made them so.

Not only the common people, but the whole nation, are much more used to fish than flesh; for their fasts take up near two-thirds of the year, during which they are absolutely prohibited by their religion to taste of flesh: this is observed with the utmost strictness; they will not even taste of eggs, milk, or any thing that has even the least relation to flesh; but caviere is a great dish among them. At the other times of the year, people of rank have at their tables a variety of flesh-meat and fowl; but before they sit down, the mistress of the family presents every one of the guests with a cup of brandy on a plate, or salver, with her own hands; and, among particular friends, all the company salute the lady. The first dish usually consists of hams, tongues, and other savoury dishes, with several made-dishes dressed with oil, olives, onions, and garlic; which having remained a considerable time on the table, the second course, consisting of soups and roast and boiled meat, is brought in; after which follows the dessert, and plenty of mead, beer, wine, and brandy.

A person may travel cheap and with great expedition in Russia, both in summer and winter; the post-roads leading to the chief towns are very exactly measured, with the wersts marked, and the post-stages fixed at proper distances; for throughout the whole empire, and even in Siberia, a pillar, inscribed with the number of wersts, is erected at the end of each. The expence of travelling in this manner is so easy, that between Riga and Petersburg the hire of a post-horse for every werst is no more than two copeiks and a half, which is one penny three farthings sterling; between Novogrod and Petersburg only one copeik; and between Novogrod and Moscow but half a copeik. Nothing can be more accommodated to ease and dispatch than travelling in sledges during the winter, when the earth is covered deep with snow, and impassable for wheel-carriages; for in the journey Mr. Hanway made in that season from Moscow to Petersburg, he slept in his sledge, without waking, while he advanced a hundred wersts, or sixty-six English miles. The whole road between those two cities was marked out in the snow by young fir-trees planted on both sides, at the distance of twenty yards, which, at a moderate computation, amount to 128,480 trees. At certain distances were also great piles of wood, to be set on fire, in order to give light to the empress and her court, if they passed by in the night. On these occasions her imperial majesty is drawn in a kind of house that contains her bed, a table, and other conveniences, where four persons may take a repast. This wooden structure, which has a sloping roof, and small windows to keep out the cold, is fixed on a sledge, and drawn by twenty-four post-horses; and if any of them fail on the road, others are ready to supply their places. Our author observes, that the late empress was generally no more than three days and nights on the way, notwithstanding

withstanding her having several small palaces at which she sometimes stopped to refresh herself, though the distance is four hundred and eighty-eight English miles. Peter the Great once made the journey in forty-six hours, but did not travel in the same carriage. Mr. Busching observes, that it is not uncommon to go it with post-horses in seventy-two hours; and that a commodious sledge, drawn by a pair of post-horses for that journey, may be hired for fourteen or fifteen rubles.

The Russian language derives its origin from the Slavonian, but at present it is very different from it; and, with regard to religious subjects, is enriched with a great number of Greek words. The alphabet consists of forty-two letters, most of them Greek characters, as they were written in the ninth century: but as the latter did not express every particular sound in the Slavonian language, recourse was had to several Hebrew letters, and to the invention of some arbitrary signs. In the different parts of the Russian empire various dialects are used, as the Moscovite, the Novogrodian, the Ukrainian, and that of Archangel. The dialect used in Siberia nearly resembles the last.

SECT. IV.

Of the Religion of the Russians.

THE Russians profess the religion of the Greek church, which was first embraced by the great dutchess Ogla, sovereign of Russia, in the 955th year after the birth of Christ. The external part of their religion consists in the number and severity of their fasts, in which they far exceed the Romish church. Their usual weekly fasts are on Wednesdays and Fridays. In Lent, as hath been already observed, they neither eat flesh, milk, eggs, nor butter; but confine themselves to vegetables, bread, and fish fried in oil.

The great fast of Lent is regulated by the moveable feast of Easter, and lasts till that festival begins.

St. Peter's fast always begins on the first Monday after Whitsuntide; and sometimes lasts six weeks; and at others only eight days, according as Easter happens to fall out early or late. The fast of the Blessed Virgin annually begins on the first of August, and continues till the fifteenth of the same month. St. Philip's fast begins on the fifteenth of November, and continues till the twenty-fifth of December.

The eighth week before Easter is called the butter week, and may be considered as the Russian carnival, it being spent in all kinds of entertainments, and every species of licentiousness. Among the diversions exhibited at this time, one of the most singular is riding in sledges down a steep declivity, twenty ells in height, made with boards, and covered with ice, by throwing water to freeze upon it. At this time of public diversions they atone for their bad living in Lent, by feasting and the free use of brandy. On Easter-day most of them eat to such excess, as to throw themselves into a fit of sickness by overcharging their stomachs. On that joyful festival the Russians kiss one another in the most friendly manner, presenting an egg coloured over, and sometimes tolerably painted, with the following salutation: "Christ is risen;" to which the other answers, "He is indeed risen."

The Russians are great enemies to the worship of graven images, and yet are so absurdly inconsistent, that in their private devotions they kneel before a picture of our Saviour, the Virgin Mary, St. Nicholas, or some other saint, which is an indispensable piece of furniture in their closet. To this they bow several times, making the sign of the cross with their thumb, fore-finger, and third finger, on the breast, forehead, and shoulders; at the same time repeating, in a low voice, the Lord's Prayer, and some short ejaculations; particularly, "Lord be merciful to me." Indeed they seldom pass by a church without uttering of these words, at the same time bowing and crossing themselves, without paying the least regard to any person who happens to be present. They likewise practise the same bowings and crossings on seeing a church at a distance.

Many of the common people, and even some persons of rank, either by way of penance, or from other motives of humiliation, prostrate themselves on their faces at the entrance of the churches; and those who are conscious of having contracted any impurity, forbear entering the church, but stand at the door. The church bells are often rung; and as ringing is counted a branch of devotion, the towns are provided with a great number of bells, which make as it were a continual chiming.

The divine service is entirely performed in the Slavonian tongue, which the people do not understand, as it is very different from the modern Russian; and this service consists of abundance of trifling ceremonies, long masses, singing, and prayers; all which are performed by the priests, the congregation only repeating, "Lord be merciful to me." They sometimes add a lecture from one of the fathers; but there are few churches in which sermons are ever delivered, and even in those they preach but seldom.

In the Russian churches there are neither seats or forms, but the whole congregation perform their devotions standing. On festival days the clergy are adorned with very rich vestments, somewhat resembling those of the Levitical priests described in the Old Testament. The people know very little of the Bible, which has never yet been translated into their language. They have, however, one in the Slavonian tongue, with annotations; nor are there any proper measures taken for the instruction of young people among the vulgar, in the principles of religion. The people never sing psalms or hymns, nor have any hymn books in their houses; for none but the choiristers are allowed to sing psalms in the churches, that office being considered as their peculiar province, on which account they are held in some esteem.

Besides the great festivals ordained by the Russian church, there are every year others appointed by the civil power, when all public business and trades are suspended with greater strictness than even during the former; such as the anniversary of the birth, inauguration, and coronation of the person on the throne, and of the saint's day whose name he or she bears; and likewise the festival of the birth and name-day of other persons of the royal family; that of St. Alexander Neufski, which is kept on the thirtieth of August; and the anniversary of the battle of Pultowa, which is commemorated on the twenty-seventh of June.

There are a great number of convents for the religious of both sexes in the Russian empire; but Peter I. prudently ordered, that no person should be allowed to enter on a monastic life before fifty years of age: but this regulation has been repealed since his death, it being thought proper to shew a greater condescension to the monasteries; however, no man is permitted to turn monk till he is thirty, nor no woman to turn nun till she is fifty; and even then not without the express approbation and licence of the holy synod. The abbot, or head of an abbey, is here called archimandrite, and the prior of a convent, igumen; while an abbess is styled igumenia.

Every large village has a church and a priest to officiate in it, and in the towns there is a church almost in every street. It is remarkable, that all the old churches have a crescent under the cross erected on the tops of the towers.

With respect to baptism, they acknowledge themselves conceived and born in sin, and therefore baptize their children immediately after they are born: if they are weak, this is done at home; but if well, in the church; the child being received at the church-door by the priest, who signing his forehead with the sign of the cross, says, "The Lord preserve thy coming in and going out." He then fastens nine wax-candles given him by the godfathers, ready lighted, round the font. Having incensed the godfathers, and consecrated the water, each of them takes a wax-candle, and they all walk three times round the font, which always stands in the middle of the church, the clerk carrying the picture of St. John before them, and the priest reading out of a book. The priest then asks the godfathers the name of the child, which having given him in writing, he puts it upon a small picture, which he holds upon the child's breast, while he mutters certain prayers; and then asks, whether the child believes

in God the Father, the Son, and the Holy Ghost; and the godfathers having answered in the affirmative, they instantly turn their backs to the font, to shew their aversion to the three next questions, Whether the child forsakes the devil, his angels, and his works? To each question the godfathers answer Yes, and as often spit on the ground. Then turning again to the font, the priest asks, whether they promise that the child shall be brought up in the true Greek religion? and laying his hands upon him says, "Get out of this child thou unclean spirit, and make room for the Holy Ghost." He then blows upon the child three times to drive away the devil, by whom they suppose children are possessed before baptism. After this he cuts off a little of the child's hair, which he puts into a book; and having asked the godfathers whether they desire the child should be baptized, he takes him naked into his arms, and, dipping him three times into the water, makes use of the usual words: "I baptize thee in the name of the Father, and of the Son, and of the Holy Ghost." He then puts a corn of salt into the child's mouth, and making the sign of the cross on his forehead, hands, breast, and back, with consecrated oil, puts him on a clean shirt, saying, "Thou art as clean from thy original sin as this shirt." He hangs a small cross of gold, silver, or lead, according to every one's ability, about his neck, with a strict charge to wear it all his life-time: in which they are so exact, that if no such cross be found about a deceased person, they will not allow him Christian burial. He also assigns a peculiar saint, whom the child is hereafter to reverence as his patron; and having kissed the child and his godfathers, he exhorts them to mutual love. If more children are to be baptized at the same time, the font is emptied, because they imagine the water to be defiled by the original sin of the preceding child.

As they imagine that children are regenerated by baptism, they think they have a right to the Lord's supper, which is administered in the following manner: the priest going to the altar, attended by the clerk, says the office according to St. Basil's liturgy; and then mixing warm water with the wine, steepes bits of bread in the chalice, and then consecrates them together. The priest takes the bread out with a spoon, and gives it to the communicants, little babes having only half the quantity of grown people, till they are seven years of age.

Their proselytes who are of age are baptized in a river, and three times plunged over head like the children, on mentioning the Father, Son, and Holy Ghost.

Persons who are inclined to change their religion for that of the Moscovites, are instructed for six weeks in some convent; and at their baptism are to abjure their former religion, to desert it as heretical, and as often as it is named to shew their adhorrence, by spitting on the ground.

The metropolitans, who are only two, one at Kiow and the other at Tobolski, differ from the bishops only in their title: above these are the archbishops; and the deacons, popes, or priests, and protopes are exceeding numerous. In antient times the primate, or supreme bishop of the Russian church, was a suffragan to the patriarch of Constantinople; but the czar Feodor Iwanowitz appointed a Russian patriarch to preside over the church; yet as these patriarchs gradually assumed an exorbitant power, dangerous even to the state, Peter I. on the death of the last patriarch, in 1701, suppressed that dignity, and declared himself head of the church of Russia. In the year 1719, the same prince instituted a council that has the direction of ecclesiastical affairs, and is stiled, The most holy synod. Subordinate to this council are two others; the first called the œconomie, which has the management of all the ecclesiastical lands and revenues; the second has power to execute the regulations made in relation to the separatists, called Roskolniki, and levies the tax imposed on them for being permitted to wear their beards. This, however, is allowed to all ecclesiastics of the Russian church, who likewise wear their own hair, and on their heads a high stiff black cap, from which a piece of the same stuff hangs down on their backs, or else a large flapped hat. They have over their shoulders a sort of long cloak; but the secular priests, when out of the church, generally wear a blue or a brown

long coat. The clergy are permitted to marry, but it must be to a virgin; and, on her death, he is neither allowed to marry again, nor to hold his benefice; but must either retire to a convent, or be degraded; and if he chooses the latter, he is at full liberty to marry a second time: hence no wives are better treated than those of the ecclesiastics.

The Russian separatists are, by way of contempt, termed Roskolniki, or schismatics; but they call themselves Starowierzi, or antient believers. Their chief peculiarities consist in having their own books, from the authority of which they make the usual sign of the cross, only with the fore and middle finger, like the orthodox Russian clergy, when they give the benediction, and consequently differ from the laity of the national church, who make it with the thumb and the fore and middle finger. But this is not their only crime; they let their beards grow to the full length, though this privilege can only be procured, as hath been already intimated, by paying an exorbitant tax. They also entirely abstain from spirituous liquors, never enter the national church, and will neither eat nor drink out of any vessel that has been used by those who stile themselves orthodox Russians. This sect is not very numerous in Russia, though it has spread over all Siberia.

The natives of those provinces that have been conquered from Sweden profess Lutheranism; and both the protestants, of whom there are many among the Russians, and those of the Romish church, enjoy full liberty of conscience, and the public exercise of their religion; so that they have churches and priests, or ministers, at Moscow, Petersburgh, Cronstadt, Archangel, and Astracan; but those of the church of Rome have no longer the privilege of hanging bells in their churches. The Armenians have public places of worship only at Astracan. The Jesuits and Jews have been banished from the country; but it is thought that many who secretly adhere to Judaism still remain there.

A considerable number of the Russian subjects are Mahometans, and still greater numbers are Pagans. In order to promote their conversion, the synod has instituted a peculiar society for propagating Christian knowledge, and it is said many thousands of them have been converted to Christianity; but, on the other hand, it appears, from the writings of those who have lately travelled thro' Siberia, that great violence and constraint have been used to bring them over; and, that as most of the people have been baptized against their will, they have very imperfect and contemptible ideas of the religion they are said to profess.

In the thirteenth century several popes laboured hard to put the great duke of Russia out of conceit with the Greek religion, but without success. The doctors of the Sorbonne, at Paris, have since made the same attempt; for when Peter the Great suppressed the patriarchate, they endeavoured to persuade him to bring about an union of the Russian church with that of Rome; but this point they were unable to carry.

S E C T. V.

Of their Marriages and Funeral Ceremonies.

THE marriage ceremonies of the Russians, as described by the author of the Travels of the Holstein ambassadors through Russia to Persia, were very particular; and, as it does not appear that any other alterations on those occasions have been made, than such as necessarily arose from Peter the First introducing a greater degree of familiarity between the sexes, and permitting them to see and converse with each other, we shall here give them to our readers.

When every thing is agreed upon between the parents, if they are of quality, a woman, called the suacha, is appointed by the friends of the bridegroom, and another by those of the bride, to take joint care of the nuptials, who provides every thing fit for the chamber where the new-married couple are to lie. The bed is made of forty sheaves of rye laid in good order, and encompassed with several barrels of wheat, barley, and oats. When all is ready the bridegroom goes late in the evening, accompa-

ried by his kindred; the priest who was to marry him leading the van on horseback. They are received at the bride's door by her relations, invited to come in, and to sit down at table; where only three dishes of meat are served up, and even these are not to be touched by any one present. At the upper end of the table a place is left for the bridegroom, which is taken up by a young lad appointed for that purpose, while the bridegroom is talking with the bride's friends: but at length he having prevailed on the youth by some presents to resign his place to him, takes his seat, and the bride, richly dressed, used to be brought in with a veil over her face, and placed next the bridegroom; two lads at the same time holding a piece of taffety between them, to prevent their seeing each other. The *suacha* then comes in, and paints her, ties up her hair in two knots, puts a coronet on her head, and all the ornaments of a married woman. The coronet is of gold or silver gilt, and lined with silk; having on both sides, near the ears, five or six rows of pearls, hanging down in strings on her breast. The upper garment, which has sleeves an ell and a half wide, is embroidered at the edges with gold and silver, especially about the neck, where it is stiff with embroidery for the breadth of three inches. They sometimes bestow a thousand crowns upon this robe. The bridegroom is then painted by his *suacha*, whilst the women who are present stand singing upon the benches.

At length they all go to church, where the young couple stand upon a piece of taffety, and have a canopy of the same silk over their heads. Here having made offerings of fried meats, fish, and pastry, the priest gives them his benediction, and taking the man by his right hand, and the woman by her left, he asks them three times, whether they are both willing to be married, and to love one another as they ought to do. To which having answered Yes, the whole company join hands, and the priest sings the CXXVIIIth Psalm; which being ended, he puts a garland of rue upon the heads of the young couple, and if one of them be a widow or widower, about their shoulders, saying, "Increase and multiply. Whom God hath joined together, let no men put asunder." While the priest pronounces these words, each of the people invited to the wedding lights a wax-candle, and one of them gives a glass of wine to the priest, which he drinks; and the married-couple having pledged the same three times each, the bridegroom throws down the glass, and he and the bride treading it under their feet, saying, "May they thus fall under our feet, and be trodden to pieces who shall endeavour to sow division or discontent between us." The women then throw some flax or hemp-seed on the young couple, wishing them much prosperity; and some pull the bride by the robe, as if they would take her from the bridegroom, to whom she sticks close, while they seem unable to remove her.

The nuptial ceremony being ended, the bride returns in a sledge, or coach, by the light of six flambeaux, and the bridegroom on horseback. The men immediately sit down at the table, which is covered with provisions; while the women conduct the bride into her chamber, undress her, and having put her to bed, come to the bridegroom, who rising from the table, is conducted to the bride's chamber, by six or eight young men, each with a wax-candle in his hand, which they stick in the barrels of wheat, barley, and oats that stand round the bed: the bride no sooner sees the bridegroom than she slips on a morning-gown, lined with fur, and rising meets and salutes him with a low inclination of the head; and this used to be the first time of the bridegroom's seeing her face. They then sit down to a table, where, among other provisions, they have a roasted fowl, which the bridegroom pulls asunder, and throwing over his shoulder the part he lights on first, they eat the rest, and then go to bed; while the guests employ themselves in several charms to promote the happiness of the new-married couple. Some time after an old servant of the house, who attends at the door, comes and asks whether the business be done; and the bridegroom answering Yes, the word is given for the trumpets and timbrels to strike up, and these sound till the new-married couple are conducted to the stoves, where they bathe themselves apart.

After they have been well washed in the bath with water, mead, and wine, the bride sends the bridegroom a shirt richly embroidered, especially at the neck, and a rich habit. The two next days they spend in mirth and festivity.

Persons of inferior rank are satisfied with fewer ceremonies, for the night before the wedding the bridegroom sends some cloaths, a comb, and a looking-glass; and the next day the priest is brought in by two lads, carrying lighted wax-candles. As soon as he enters the house, he gives his benediction first to the lads, and then to the guests. The young couple being set down at the table, the lads holding a piece of taffety between them, the *suacha* dresses the bride's head, which being done, a looking-glass is brought, and the young couple joining their cheeks, look and smile one upon the other, while the two *suachas* cast hops upon them; after which they go to church, where they are married with the ceremonies already mentioned.

As the Russians esteem marriage a very sacred thing, polygamy is forbidden under pain of death; the emperor himself being allowed only one wife at a time; though if she proves barren, he may send her into a monastery, and marry another. Second marriages they consider as allowable, but not very commendable: a third marriage is not to be undertaken but upon very weighty considerations; and a fourth is punished with death.

Their funerals, like their other public actions, are performed with great ceremony; for the soul of the sick person is no sooner departed, than the widow sends for their kindred and friends, who standing round the corpse break out into lamentations. They then wash the body, and having put a clean shirt or shroud about him, with a new pair of thin Russia leather shoes on his feet, lay him with his arms across his breast, in a coffin made of the trunk of a tree, and in the mean while send a present to the priest to pray for his soul. The coffin is covered with a piece of cloth, or the coat of the deceased. The richer sort, if the season will permit, keep the body eight or ten days, during which the priest comes every day to purify it with incense, and by sprinkling it with holy water.

At length the priest proceeds with the picture of the patron saint of the deceased, followed by four virgins, who are nearest related to the latter, and make very mournful lamentations, but begin and leave off exactly at a time. Then comes the dead body carried by six men upon their shoulders; but if the deceased be a monk, or a nun, this office is performed by those of his own profession. The corpse is surrounded by several priests, who incense it, to keep off the evil spirits, all the while singing Psalms; then follow the kindred and friends with wax-candles, but without any order. On their coming to the grave the coffin is uncovered, and the priest holding over it the picture of the patron saint, says several prayers, in which he often repeats, "Lord look upon this soul in righteousness." Mean while the widow continues her lamentations, and the relations and friends, after kissing either the deceased or his coffin, take their leave. The priest then takes a piece of paper, signed by the bishop of the place and the confessor, and is a kind of ticket for his entrance into paradise. This he puts into the coffin, which is then shut and put into the grave, with the face turned towards the east; while those who return to the house of mourning, drown their sorrow in good liquor.

Their whole time of mourning lasts forty days, during which three feasts are made for the relations of the deceased, on the third, ninth, and twentieth day after the burial; during which the priest says certain prayers morning and evening over the grave, which for that purpose is covered with a small hut of mats: for though the Russians do not believe in purgatory, but maintain that there are two places to which the souls of men retire after their separation from the body, there to wait till the day of judgment, some in a pleasant and delightful abode, where they enjoy the conversation of angels; others in a gloomy and dismal valley, where they see nothing but devils; and that while the soul is yet on its way, it may be diverted from the evil road by the prayers of the priests and monks.

Marriage Ceremony of the Russians.

S E C T. VI.

Of the Learning of the Russians, and their Skill in Arts and Manufactures. The Method of making Caviar. The Exports and Imports. The Trade carried on by Land; and the Manner in which it is conducted at Peterburgh. The Weights, Measures, and Coins of Russia.

LEARNING was but little known in Russia before the reign of Peter the Great; but that illustrious monarch spared neither expence nor trouble to dispel the clouds of ignorance which overspread his empire, and to inspire his subjects with a taste for the arts and sciences: he founded an academy of sciences, an university, and a seminary at Petersburg; besides other schools in the different parts of his empire: invited persons of learning from England, Germany, France, and Holland, to settle at Petersburg: collected a great number of books; and encouraged his subjects to travel into those countries where the arts and sciences flourished. These wise and laudable measures were continued after his death, and the empress Elizabeth erected an university and two seminaries at Moscow. Hence many men of genius among the Russians have cultivated their minds, and made a considerable figure in the republic of letters. Indeed the number of learned Russians is but small; and as there are only three universities in that vast empire, those of Petersburg, Moscow, and Kiow, learning may justly be said to be yet only in its infancy in that empire. The Russians are, however, far from wanting talents and a disposition for learning. The studies to which they chiefly apply themselves are history, geography, and the mathematics.

We find that the members of the academy of sciences at Petersburg not only publish collections of their own memoirs, but compose a variety of books for the instruction of youth in the sciences, and make translations of the most useful books published in foreign countries. Peter the Great established the mystery of printing, that everlasting guardian and friend of the arts, in Russia. His types and other implements for that purpose were brought from Holland. Indeed a press, with letters, had been sent from Poland to Moscow, and a printing-house erected, by the approbation of one of the former czars; but the building was set on fire in the night, and burnt to the ground, by the procurement, as was generally supposed, of the ignorant and superstitious priests, who thought all books, and especially such as treated of their own history, and the miracles of their saints, to be no less dangerous than witchcraft.

All the mechanic arts and trades are continually improving in Russia, and these improvements are far from being entirely owing to the foreigners who reside among them; for the natives being spurred on by emulation, frequently equal, and sometimes exceed their masters. They were formerly almost solely employed in agriculture, feeding of cattle, hunting, and fishing. They excelled indeed in making Russia leather, which had been long practised by them; but they were entirely unacquainted with the more ingenious methanic arts. Great numbers of excellent artificers, invited by Peter the Great, settling in his dominions, the Russians shewed that, with proper instructions, they did not want the capacity of being taught; and they have now flourishing manufactures of velvet, silk, linen, and woollen stuffs; also copper, brass, iron, steel, and tin, are wrought; and great guns, fire-arms, gunpowder, wire, cordage, sail-cloth, paper, parchment, and glass, are made in Russia. All these manufactures are, however, not brought to such perfection as to be carried on without the assistance of foreigners, and additional supplies of those commodities from abroad. Besides, those made by Russian workmen are sold for one-half or a third part less than those made by foreigners at Petersburg and Moscow; and indeed they will not do more than half or a third part of the service: but ship-building is carried to great perfection in Russia. As for the Russian peasants, they are their own artists, and make all the utensils they want.

As caviar forms a considerable branch of their commerce, it will not be improper to give here the manner in which it is prepared. It is made of the roes of the fish called beluga and the sturgeon. The best is made of the beluga roes, and is of two sorts; the granulated and pressed. The former, which is most esteemed, is prepared in autumn and winter, but the latter is made in summer, and both sorts are exported to the southern parts of Europe. The granulated sort is first salted, after taking away the stringy part, with salt well cleaned and made into brine; and, being drained from the oily parts, it is put into kegs for exportation. Caviar is most palatable when fresh and spread on bread with salt, leeks, and pepper, and is therefore sent in the winter frozen to all parts of the empire; but, as it soon becomes tainted by warmth, it cannot well be exported fresh.

Russia affords a variety of articles of commerce, that are of great use to foreigners; and, as the exports of this country far exceed its imports, the balance of trade is considerably in its favour. The other Russian home commodities are fables and black furs; the skins of blue and white foxes, ermines, hyenas, linxes, squirrels, bears, panthers, wolves, martins, wild cats, white hares, &c. Likewise Russia leather, copper, iron, ising-glass, tallow, pitch, tar, linseed oil, train oil, rosin, honey, wax, potash, salt-fish, hemp, flax, thread, calimancoes, Russia linen, sail-cloth, mats, castor, Siberian musk, mamonts teeth and bones, as they are called, soap, feathers, hogs bristles, timber, &c. to which may be added the Chinese goods, rhubarb, and other drugs, with which the Russians partly furnish the rest of Europe.

The fishery of seals, of which about ten thousand are annually caught, yields five thousand measures of oil. The skins and oil are sent to England. Morfes, or sea-horses, from Nova Zembla, used to load thirty boats a year with blubber, and their teeth are esteemed next to ivory: but this trade being monopolized by a company, daily decays. Of cod and stock-fish, about three ships lading are sent yearly to Denmark: of salmon, salted and dried, a ship's loading to Bilboa.

The goods imported into Russia are silk, cotton and other woollen stuffs, fine linen, chintz, toys, French brandy, wine, herrings and other fish, spices, hardware, &c. In 1749, the value of the goods exported from Petersburg amounted to three millions one hundred and eighty-four thousand three hundred and twenty-two rubles, and that of the imports to two millions nine hundred and forty-two thousand two hundred and forty-two rubles. Of these the value of two millions two hundred and forty-five thousand five hundred and seventy-three rubles were exported to England; and the value of the commodities imported from thence amounted to one million twelve thousand two hundred and nine rubles.

But it will not be improper to enter here more minutely into the state of commerce in the Russian empire. The trade of Russia may be divided into domestic and foreign, or that by land and sea. The land-trade chiefly consists of,

1. The trade to China, which is chiefly carried on by caravans, and partly by private adventurers. The most valuable commodities, and those in the greatest quantity, carried by the Russians to China are furs; in return for which they bring back gold, tea, silks, cotton, &c.

2. The trade to Persia, by the way of Astracan and the Caspian sea, is pretty considerable; and the returns are made in raw silks and silk stuffs.

3. The trade with the Calmucs, which is entirely in private hands, consists of all kinds of iron and copper utensils; in return for which they receive cattle, provisions, and sometimes gold and silver; but this trade is of no great importance.

4. The trade to Bochara, one of the chief towns of Ussbec Tartary, is either for ready money or by bartering of goods for curled lamb skins, Indian silks, and sometimes gems brought to the yearly fair of Samarkand.

5. The traders in the Ukraine sell all kinds of provisions to the Crim Tartars; and also carry on a trade with the Greek merchants at Constantinople.

The inhabitants of Kiow trade to Silesia in cattle and Russia leather.

The

The Russians were strangers to the course of exchange, till it was introduced among them in the year 1670. Money was then so very scarce in this empire, that foreigners were obliged to barter their goods for those of Russia. Most of the foreign merchants then resided at Moscow, but took a journey in the summer to Archangel, where they had their warehouses and factors. This practice continued till 1721, when, by the order of Peter the Great, the seat of commerce was removed from Archangel to Petersburg; on which the foreign traders removed their factories thither, where they are not allowed to keep the goods consigned to them in their own warehouses, but are obliged to deposit them in magazines built for that purpose by the government, to which they pay rent for warehouse-room, in proportion to the quantity of their goods.

The merchants and traders of Petersburg, as in other countries, consist of natives and foreigners. The former may sell either by wholesale or retail; but the latter by wholesale only, and that to none but the natives: for they are not permitted to sell any thing to one another, or to have any commercial dealings together. Most of the foreign traders at Petersburg are only factors, and the rest, who trade on their bottoms, deal chiefly in grocery. The factors are intrusted with large capitals, and, without engaging in commerce for themselves, may raise handsome fortunes. The Russian traders, who bring goods to Petersburg and carry foreign commodities farther into the continent, do not reside in that city, but annually bring their goods thither in May or June by water, and in September, October, and December, return with foreign commodities; but the wealthy save the fatigue of travelling, by sending their factor to Petersburg.

All foreign merchandizes are generally sold at a twelve months credit; but the Russian commodities must be paid for at the delivery of the goods, except the natives find a difficulty in selling their stock; in which case they deal by way of exchange; yet will not barter goods for goods, but generally insist on one-fourth, one-third, or one-half of the value of the whole in specie; and of late foreign merchants deal for the Russian commodities by contract, and even advance the money to the Russians in winter, upon condition of their delivering in the goods at a settled price the following summer; but, for the greater security, these contracts are entered in the custom-house books.

The English enjoyed considerable privileges in trade so early as the reign of the czar Iwan Basilowitz, to whom captain Chancellor delivered a letter from Edward VI. in 1553, and received a licence to trade, which was renewed by Peter the Great. In 1742 a treaty of commerce was concluded between Russia and England, by which it was stipulated, that the English should be allowed the privilege of sending goods through Russia into Persia; but captain Elton, an Englishman, having entered into the service of Nadir Shah, and built ships on the Caspian sea for that monarch, the Russians, together with the troubles in Persia, put a stop to this trade. The English, however, still carry on a considerable trade with Russia, which exceeds that of any other nation.

The goods chiefly imported from England are all sorts of woollen manufactures, lead, tin, pewter, dying woods, indigo, olibanum, brimstone, and lignum-vitæ. The Hollanders and Hamburgers, besides these, bring wines, paper, allum, glass-ware, spices, dollars, plate, gold and silver lace, brocades, Silesia cloth, &c.

The exports of the English from Russia are hemp, flax, linen, train oil, pot-ash, rhubarb, isinglass, wax, tar, red hides, and caviar. The Dutch and Hamburgers receive also from thence wood-ashes, masts, hides dried, tallow, fables, hemp-seed, mats, and hogs bristles.

The Dutch carry on the greatest trade, next to the English, with the Russians. Bills of exchange are drawn at Petersburg on Amsterdam only; on which account the traders of other countries, who give commission for buying Russian commodities at Petersburg, are obliged to procure credit, or to have proper funds at Amsterdam.

The trade to Petersburg is now carried to a great height, for the number of ships which entered that port in 1751 from England, Holland, France, Norway, Den-

mark, Lubec, Hamburg, Stetin, Rostoc, Kiel, Prussia, Sweden, and Dantzic, amounted to two hundred and ninety. Indeed there is no nation in the world more inclined to commerce than the Russians are at present; but they are so full of chicanery and art, that a foreigner cannot be too much on his guard in his dealings with them.

The weights peculiar to Russia are a solothnic, which is one-sixth of an ounce, and is divided into halves, quarters, and eighths: a Russian pound, equal to ninety-six solothnics: a pud, or pood, equal to thirty-six pounds avoirdupois: a berkowetz, equal to ten puds. The other weights are the same with those of Germany.

The measures of length are the arshine, or Russian ell, equal to twenty-eight inches and one-tenth English measure: a werloc, which is one-fifteenths of an arshine; and a sashen, or fathom, contains three arshines.

All the Russian coins, ducats excepted, have inscriptions in the Russian tongue. The gold coins are imperial ducats; and the largest silver coin is the ruble, the value of which rises and falls according to the course of exchange. A ruble in Russia is equal to an hundred copeiks, or four shillings and six-pence sterling. The other silver coins are half rubles, which are called poltinnics and quarter rubles. A gryphe, or griwe, is of the value of ten copeiks; and ten griwes are equal to a ruble.

The copper coins are a copeik, which is of the value of about a halfpenny. A denga, or denushka, two of which make a copeik; and a polushka, which is a quarter of a copeik.

There are no other foreign pieces current in Russia than ducats, Holland rixdollars, and Albert dollars.

Besides the Russian coins, the following are also current in Livonia: a white schelling, which is worth two black schellings; three of the former make one grosh, which is seven-fifteenths of a penny: a farding, which is one grosh and a half: a Riga mark, which is six groshes: a Polish guilder, which is five Riga marks: a kopa-shock, or lowenthaler, equal to twenty-five groshes; and a rixdollar, valued at sixty fardings.

SECT. VII.

Of the Coronation, Titles, Arms, Court, Revenues, and Forces of the Emperor, by Land and Sea.

AT the accession of an emperor to the throne, the metropolitans, archbishops, and bishops, with all the nobility and principal merchants throughout the empire, are summoned to Moscow against the day of coronation; when the archbishop of Moscow conducts the emperor to the church of Precheste, or our Lady, where a scaffold is erected, three steps high, covered with rich Persian tapestry, on which are set three chairs at equal distances from each other. One of these is for the emperor, another for the archbishop, and the third for the imperial cap and robe. The robe is of purple sattin, lined with sable, and on the top of the cap, which is embroidered with jewels, is a small crown set as thick as possible with diamonds, and said to be the same which the great duke Demetrius Monomach took at Caffa, in Tartary, and destined for the coronation of his successors.

On the prince's entering the church, the clergy begin their hymns; after which the archbishop prays to God, to St. Nicholas, and the other saints, desiring their presence on that solemn day. The prayer being ended, the chief counsellor of state takes the emperor by the hand, and presenting him to the archbishop, says, "The knez and bojars acknowledge the prince here present to be lawful heir to the crown, and desire that as such you immediately crown him." Upon this the archbishop leads the prince up to the scaffold, seats him on one of the three chairs, touches his forehead with a little cross of diamonds, and blesses him. Then one of the metropolitans reads the following prayer:

"O Lord our God, King of Kings, who didst choose thy servant David, by thy prophet Samuel, and didst cause him to be anointed king over thy people Israel, attend to our prayers, which, though unworthy, we offer up to thee. Look down from thy sanctuary upon this thy servant, whom thou hast chosen and ex-

“ altd

“ altd for king over theſe thy holy nations : anoint him
 “ with the oil of gladneſs ; proteſt him with thy power ;
 “ ſet upon his head a precious diadem ; grant him a long
 “ and happy life ; put into his hand a royal ſcepter, and
 “ make him fit upon the throne of juſtice ; make ſubject
 “ to him all barbarous nations ; may his heart and un-
 “ derſtanding always continue in thy fear, and thro’
 “ the whole courſe of his life may he obey thy com-
 “ mandments : ſuffer not any hereſy or ſchiſm to come
 “ near his perſon or government ; but ſhew him the
 “ ſalvation of thy holy and univerſal church, that he
 “ may judge thy people with juſtice, proteſt the chil-
 “ dren of the poor, and finally attain everlaſting life ;
 “ for thine is the kingdom, the power and the glory.
 “ God the Father, God the Son, and God the Holy
 “ Ghoſt, be with us, and remain with us.”

This prayer being ended, the archbiſhop orders the two metropolitans to take the cap and robe ; and ſome of the bojars, whom he directs to come upon the ſcaffold, are bid to put them on the prince, whom he bleſſes a ſecond time, by touching his forehead with the little croſs of diamonds ; and while they ſet the ducal cap upon his head, the archbiſhop ſays, In the name of the Father, Son, and Holy Ghoſt, and bleſſes him a third time.

The archbiſhop then bids all the prelates approach, and each of them gives the emperor his benediction. The emperor and the archbiſhop then ſit down, but immediately riſe again, to order the ſinging of the Litany, every verſe of which ends with “ Lord have mercy upon us,” and is frequently intermixed with the emperor’s name. After the Litany they ſit down again, and one of the metropolitans goes up to the altar, and ſings, “ God preſerve
 “ the health of the emperor of all the Ruſſias, whom he
 “ hath of his love beſtowed upon us, and grant him a
 “ long and happy life.” Theſe words are echoed round for ſome time by every one preſent, after which the archbiſhop alone goes up to the prince, and tells him,
 “ That ſince, through the providence of God, all the
 “ ſtates of the realm, as well eccleſiaſtical as temporal,
 “ have eſta bliſhed and crowned him emperor of all the
 “ Ruſſias, and entrusted him with a government of ſuch
 “ importance, he ought to apply all his thoughts to love
 “ God, keep his commandments, adminiſter juſtice,
 “ and proteſt and maintain the true Greek religion.” He then bows down to the ground before the emperor, as a token of his homage ; and all the reſt, eccleſiaſtics, nobles, and others, in their reſpective ranks, do the ſame. They then go to the church of St. Michael the Archangel, and afterwards to that of St. Nicholas, both of which, as well as that of our Lady, are within the walls of the palace, and, after ſinging in each of them the ſame Litany as before, conclude the ceremonies with dining in the great hall of the Kremlin.

The antient ſovereigns of Ruſſia ſtiled themſelves great dukes, and afterwards czars ; but Peter the Great aſſumed the title of emperor, and that title is now given him by all Europe. The titles of the emperor at full length are, Emperor and ſole ſovereign of all the Ruſſias, ſovereign lord of Moſcow, Kiow, Wlodimiria, Novogrod ; czar in Caſan, Aſtracan, and Siberia ; lord of Pleſkow ; great duke of Smoleſko ; duke of Eſthonia, Livonia, and Carelia ; of Tweria, Ingria, Pernia, Wiatkia, Bulgaria, and lord of ſeveral other territories ; great duke of Novogrod, in the low country of Tſhernickow, Reſan, Roſtow, Iaroſlaw, Bielo-ſero, Uldoria, Obdoria, Con-
 “ dinia ; emperor of all the northern parts ; lord of the
 “ territory of Juweria ; of the Carthalianian, Grewzinian,
 “ and Georgian czars ; of the Kabardinian, Circaſſian, and
 “ Gorian princes ; and lord and ſupreme ruler of many
 “ other countries and territories.

Since the reign of Iwan Baſilowitz, the arms of Ruſſia have been, or, an eagle diſplayed ſable, holding a golden ſcepter and monde in his talons : over the eagle’s head are three crowns, and on its breſt it bears a ſhield, with the arms of Moſcow in the center, encompaſſed by ſix others, which are thoſe of Aſtracan, Siberia, Caſan, Kiow, and Wlodimiria.

The power of the Ruſſian emperor is as abſolute and unlimited as poſſible. Peter the Great published an ordinance, by which the ſucceſſion was entirely to depend

on the will and pleaſure of the reigning ſovereign ; and this is the only written fundamental law in relation to the ſucceſſion.

The Ruſſian court has always been very numerous and magnificent, it being filled, particularly on ſolemn occaſions, by the bojars or privy counſellors, and by the nobles and gentry, who are obliged to pay a conſtant attendance, by titles of honour and diſtinction, without any ſalary ; as the carvers, who are always two of the firſt nobility, and whoſe employment is eſteemed extremely honourable ; the ſewers, who carry meſſages of importance, receive ambaffadors, &c. and the gentlemen of the bed-chamber. Theſe two laſt titles are given to a great number of perſons, and deſcend from father to ſon, though they are generally confirmed by the prince ; and laſtly, the chief merchants. On public feſtivals and days of ceremony all theſe antiently received rich brocade gowns, lined with furs, from the treaſury, which they returned as ſoon as the appearance was over. Peter the Firſt, however, aboliſhed theſe formalities, without ſettling any other court, either to ſave the expence during the wars in which he was engaged, or from his particular temper, which was averſe to ſuch conſtraints. On any ceremony he was attended by the chief officers of his army, and only ſome of his nobility. The former pomp has, however, been ſince reſtored, and augmented by the addition of three orders of knighthood, created by the great prince we have juſt mentioned.

The firſt and moſt honourable is that of St. Andrew, or the blue ribbon, inſtituted by Peter the Great in 1698, in honour of St. Andrew, the patron of Ruſſia. The empreſs Catharine gave the ſtatutes, and aſſigned proper habits for this order, which hath its enſigns, motto, and collar.

The ſecond is the order of St. Alexander Newſki, or the red ribbon, which was inſtituted by Peter I. but the czarina Catharine firſt conferred it in the year 1725. This order has alſo its badge and motto.

There is likewiſe a female order founded by Peter in 1714, in honour of his conſort Catharine, and from her called the order of St. Catharine. Theſe honours, as Voltaire obſerves, command reſpect, coſt the ſovereign nothing, and flatter thoſe who receive them, without adding to their power.

The chief officer under the emperor is the chancellor, after whom is the grand maſter of the houſhold, the maſter of the horſe, the treaſurer, comptroller, chamberlain, taſters, harbingers, &c.

An hundred and fifty tables are now ſpread twice a day at the Ruſſian court, and ſerved with eighteen hundred diſhes ; for this purpoſe the court-purveyor receives two thouſand rubles every three days, excluſive of the produce of the crown eſtates, and the proper quantities of wine, ſugar, and ſpices. The daily conſumption of coffee amounts to one pud, or thirty-fix pounds weight, and ſeven thouſand puds of ſalt are expended every month.

The revenues of the Ruſſian empire are variously computed, ſome reckoning that they amount to fixty millions of rubles, others to twenty millions, and others again to no more than eight millions a year : but Mr. Voltaire ſays, that, according to the Ruſſian finances in 1725, they amounted to thirteen millions of rubles, reckoning only the taxes and duties paid in money, excluſive of what is paid in kind ; and adds, that this ſum was then ſufficient to maintain three hundred and thirty-nine thouſand five hundred ſoldiers and ſailors ; and that both the revenue and troops have increaſed ſince. It is, however, very certain that the imperial revenues bear no proportion to the vaſt extent of the Ruſſian dominions ; that they do not all conſiſt of ready money, the country in many places furniſhing recruits for the army inſtead of it ; and moſt of the inhabitants of Siberia pay their tribute in furs.

Theſe revenues ariſe from the annual capitation, or poll-tax, to which the vaſſals of noblemen pay ſeventy copeiks, the burghers a hundred and twenty copeiks, and the Tartars and other nations in the territory of Caſan pay a hundred and ten copeiks a man. This tax, according to Dr. Buſching, amounts to five millions of rubles.

From the demefne lands, occupied by three hundred and fixty thousand peafants, each of whom pays a hundred and ten copeiks a year, amounting in all to three hundred and ninety-fix thousand rubles.

From the inns and drinking-houfes, which are about two millions; the privilege of felling beer, mead, and malt-fpirits being monopolized by the crown.

From the tolls and customs by land and fea, which produce about one million one hundred and fifty thousand rubles.

From the trade carried on by the crown in iron, potafh, afhes of the willow tree, rhubarb, tar, and train oil.

From the falt-works, which yearly bring into the treasury feven hundred thousand rubles.

From the duty on ftampt paper, amounting to one hundred and twenty thousand rubles.

From a tax on law-fuits, which pay ten per cent. of the value contefted; from hearth-money and Bath-ftoves; and from all hackney-horfes and carriages.

From the abbey-lands, fince their being managed by a fecular commiffion, for the benefit of the crown.

From the caravans to China, which is never lefs than a hundred thousand rubles.

The produce of the public fhows of tumblers and rope-dancers, of which multitudes are exhibited at Eafter for the diverfion of the people, who are paffionately fond of them, is allotted for paying the expence of the police, paving the ftreets, &c. Befides this, every houfe-keeper pays an affeffment for his houfe and court-yard, according to the extent of the ground, which is applied to the fame purpofes.

The falaries of all civil officers are paid out of the money received by the offices belonging to their departments; and thofe of the governors, by the offices of their refpective governments. The furplus that remains in the inferior offices is fent to the treasury.

According to the ftate of the Ruffian forces drawn up by Van Hoven, in the year 1746, the army then confifted of two hundred and forty-fix thousand four hundred and ninety-four regulars, and a hundred and twenty thousand irregulars. The fleet confifted of twenty-four fhips of the line, feven frigates, three bomb-ketches, and two flat boats, befides the galley fleet at Peterfburgh, confifting of a hundred and two gallies. The complement of the whole fleet amounted to ten thousand five hundred and feventy men, of whom feven thousand feven hundred and one were failors. The fleet has continued pretty nearly the fame fince that time; for though fome new fhips have been built, others have become unfit for fervice. The men of war are laid up at Revel and Cronftadt, and the gallies at Peterfburgh. The Ruffians indeed have no very good harbour in the Baltick; the water at Cronftadt, by being too frefh, does confiderable damage to the fhips that lie there; befides, the mouth of the harbour is too narrow, and furrounded with rocks and dangerous fands, and is feldom clear of ice before the end of May: nor have they now any conftant fleet in the Cafpian fea.

The high-admiral of Ruffia has the rank and pay of a general field-marfhal; and the Ruffian fleet is divided into three fquadrons, commanded by an admiral-general in the center, who bears a white flag, with a crimfon crofs: the van has an admiral, who bears a blue flag, with a white crofs; and the rear has another admiral, who bears a red flag, with a white crofs. Each of thefe three fquadrons has a vice-admiral, a rear-admiral, and three commodores. The gallies are commanded by an admiral, two vice-admirals, three rear-admirals, and three commodores. Their flags are of the fame colour as thofe of the fquadrons to which they belong, but of a different form. When the emperor commands his fleet in perfon, his fhip bears the royal ftandard of the empire, which is yellow, and in the middle of it are the arms of Ruffia.

S E C T. VIII.

Of the feveral Colleges, or Offices for the Adminiftration of the Affairs of Government; the Laws and Punifhment of Malefaftors.

WE fhall now take a view of the executive part of the government, which was regulated by Peter I.

by whose direction all the affairs of the Ruffian empire were managed by the following councils, offices, colleges, or chanceries, as they are called.

The fenate, or directing council, which takes care of all domeftic affairs, receives accounts from all the colleges, iffues out orders to them all, and is the fupreme court of judicature, to which all proceffes are brought by appeal as the laft refort.

The holy fynod, or ecclefiaftical council, which regulates all affairs relating to the church.

The war-college, which has the care of recruiting and exercifing the whole Ruffian army, except the guards, who are under the direction of the fovereign. This office alfo receives the taxes appointed for the maintenance of the troops, and nominates the officers as high as the lieutenant-colonels. Under the war-college are the office of the general commiffary at war, the office of ordnance, that of the under commiffary of war, the military cheft, the office for cloathing the army, the victualling-office, and the accompting-office.

The admiralty-college has the management of all naval concerns, without exception; and fuch forefts as are near navigable rivers are under its infpection. Subordinate to it are the office of the general commiffary of the navy, which pays and victuals the fleet, and keeps the money affigned for thofe fervices: the ftore-office, which has the direction of the magazines, and every thing that belongs to the equipment of fhips of war: the office which directs the building of fhips, provides the neceffary materials, and has alfo the infpection of the forefts; and the artillery-office.

The college for foreign affairs, which pays the falaries of the Ruffian minifters at foreign courts, and the expences and penfions of foreign envoys, which are always defrayed. This college alfo makes out paffports, and decides the difficulties and difputes that arife in relation to foreign minifters. The members of this college are the chancellor and vice-chancellor of the empire, who, when any momentous affairs come under their confideration, are affifted by fome of the counfellors of ftate.

The college of the treasury, which has the direction of levying all the public revenues, except the poll-tax and the produce of the falt-works. The office that has the care of the money arifing from the conquered provinces is at prefent held at Peterfburgh; but all the other departments belonging to the treasury are at Mofcow.

The ftate-office iffues out the public money, and gives the neceffary directions to the chamber of accounts; hence the revenue-chambers at Peterfburgh and Mofcow are dependant on this office.

The revision-college is a fort of check on the other colleges, and therefore receives and examines their accompts.

The falt-office has the direction of the revenues arifing from the falt-works, which are appropriated to the emperfs purfe.

The confifcation chancery directs the fale of all forfeited eftates, and the levying of all fines impofed by the other colleges.

The colleges for trade, mines, and manufactures, are diftinct offices; and, befides the departments from which they take their names, have alfo the management of the naval customs and tolls, and decide all difputes in relation to commerce between merchants and traders.

The college of juftice at Mofcow, fome of the members of which conftitute a college at Peterfburgh, which determines fuits brought thither by appeal from the conquered provinces; and has likewife a confiftorial jurifdiction over the proteftants and papifts in that city; but on this occafion the minifter of the church to which the plaintiff belongs, is fummoned to attend.

They have alfo a feudal chancery at Mofcow, that has the care of every thing relating to the eftates of private perfons, their boundaries, or limits.

Befides thefe, there is a college of the magiftracy, to which all the magiftrates in the empire are accountable for their conduct; and a privy-chancery, as it is called, that takes cognizance of all hofpitals, difpensaries, medicines, &c.

In order to give a more perfect idea of this government, it is proper to obferve, that formerly the Ruffian nobility confifted folely of knefes, or princes, and gentlemen; and

and that bojar, or boyar, is not a title of nobility, but antiently denoted a post or office, as a privy-counsellor, &c. Peter the Great added the titles of counts and barons to the former: but no birth or title, according to the wise regulations made by Peter I. gives a person rank, unless he merits it by his services and abilities; by which means many foreigners of mean extraction have risen to very great honours in Russia: for in regard to unlimited subjection to their sovereign, the nobility are on a level with the rest of the people. Even the greatest of them used formerly to glory in stiling themselves the slaves of the czar, whenever they either spoke or wrote to him; but Peter I. abolished this harsh term, and ordered them to use instead of it, the word subject.

Yet the peasants are still perfect slaves, and absolutely subject to the arbitrary power of their lords, who may treat them as they please, provided they do not kill them; and are liable to be transferred, with all their goods, from one master to another. The government itself is in the last degree absolute; and, notwithstanding Peter's giving them the name of subjects, the people of all ranks may justly be termed slaves, as their lives and fortunes depend solely on the will of their sovereign. Even such as are employed in the state have their share of arbitrary power; for their proceedings being without appeal, and in the emperor's name, they often abuse their authority, in order to satisfy their avarice, revenge, or other guilty passions. For deciding cases between private men, they have precedents and written laws, particularly a code called *Subornoe Uloshenie*, an Uniform and Universal Law, which Alexius Michaelowitz published in 1649, and has been enlarged by the edicts of the succeeding czars. The process is summary, and the punishment inflicted very severe, though not quite so rigorous as formerly.

In disputes between private persons, where the parties are not agreed as to a matter of fact, and have no evidence on either side, the judge asks the plaintiff, whether he will take his oath, that the affair was as he hath represented it, or refer it to the oath of the defendant. Formerly, he who offered to take his oath was once a week, for three weeks running, brought before the judge, who every day represented to him the importance of an oath, and the dreadful sin of swearing falsely; and if after this he still persisted in his readiness to take his oath, though he swore nothing but the truth, the people would consider him as an infamous person, spit in his face, and turn him out of church; and he was never after admitted to the communion, till his being at the point of death. They now proceed with less rigour: he who is to take his oath is brought before a picture of one of their saints, where he is asked, whether he will swear upon the salvation of his soul? If he persists, they give him a little crucifix to kiss, and afterwards the picture of the saint, which is taken down from the wall for that purpose. Though the oath be indisputably true, the person who takes it is not admitted to the communion for three years; and though he is not treated as infamous, people of any rank will not easily suffer him in their company; but the perjured is punished with the knute, and then banished. Hence the Russians endeavour as much as possible to avoid taking an oath, though they are very guilty of prophane swearing, and particularly the traders have incessantly in their mouths *po Chrestum*, by Christ, making the sign of the cross at the same time. Strangers are permitted to take their oaths, according to the rules of their several religions.

The office of an executioner was formerly esteemed very honourable; but this officer is now esteemed infamous, and the executioner is not permitted to sell his office; for it must continue in his family, on failure of which, the butchers are obliged to choose one out of their body.

The ordinary punishments in Russia are, the battogen, katze, and knute. The battogen is thus inflicted; he who is to receive this chastisement, is stripped to his shirt, and laid upon the ground on his belly, when two men sitting upon him, one upon his neck, and the other upon his feet, beat him on the back with little wands, or switches, during the time ordered by the judge.

The katze is flitting the nostrils, which was formerly inflicted on those who, contrary to an old prohibition, took tobacco in snuff.

The knute, as given in Russia, is a most barbarous punishment. Olearius describes the manner in which he saw it executed on eight men and one woman, for selling brandy and tobacco without a licence. The executioner's man after stripping them down to the waist, tied their feet, and took one at a time upon his back. The executioner stood at three paces distant with a bull's pizzle, to the end of which were fastened three thongs of an elk's skin untanned, with which springing forward, whenever he struck, he lashed their backs with all his strength, so that the blood gushed out at every blow. The men had twenty-five or twenty-six lashes each, till an officer who had in writing the number of stripes they were to receive, cried enough. The woman, who had only sixteen, fainted away. After their backs were thus dreadfully mangled, they were all tied together by the arms, two and two; those who sold tobacco having a little horn full of it, and those who had sold brandy, a little bottle about their necks, and whipped through the city for about half a league, after which they were brought back to the place of their first punishment, and then dismissed.

Many die of this cruel flagellation. But horrid as it must appear to every person of humanity, M. de la Motraye says, that this is only what is called the moderate knute; for when the sentence orders it between the moderate and severe, pieces of flesh are taken off at every stroke of the executioner; and when it is ordered to be given with the utmost severity, the executioner striking the flank, under the ribs, cuts the flesh to the very bowels.

Offenders are sometimes bastinadoed on their soles of their feet in a most cruel manner.

Thieves are tortured to make them discover their accomplices, and confess their other crimes; these tortures are as dreadful as can be conceived. The thief for the first offence is only whipt from the prison to the market-place, where he has his ears cut off, and is sent back to prison for two years. If he offends a second time, he is whipped as before, and afterwards banished into Siberia. Theft is never punished with death in Russia; but the receivers and concealers of stolen goods are punished equally with the thief.

Murder is punished with death. The criminal is kept six weeks in a very close prison, upon bread and water alone; after which he receives the communion, and is beheaded.

Merciful as they appear in case of murder, they seem destitute of all humanity, where a man is so unhappy as to be unable to satisfy his creditors. He who does not pay his creditor at the time agreed upon, is put into the house of an officer appointed for that purpose, and has a certain farther time allowed him to make satisfaction; but if he then fails, he is carried to prison, from whence he is brought every day to a place before the chancery, where the common executioner beats him upon the shin bones with a wand about the thickness of a man's little finger, for an hour together. He is then returned to prison, except he can procure security for his appearing again the next day at the same hour, to be treated in the same manner, till he has made satisfaction. This is rigorously executed upon persons of all ranks, subjects and foreigners, men and women, priests and laymen; and if at last the debtor cannot find wherewith to pay, he with his wife and children are sentenced to be bond slaves to the creditor.

S E C T. IX.

Of the Government of Kiow or Kiew, with an Account of the Zaporog, the Bielgorod, and Don Cossacs, the Haidamacs and Yaik Cossacs; with a Description of the Cities of Kiow, and Pultowa.

HAVING given a description of Russia in general, with the climate, manners, religion, and government of the inhabitants, we shall now give some account of the different provinces, and principal towns of the country, which contains Great, Little, and White Russia, with the provinces that formerly belonged to Sweden.

den. It must here be observed, that White Russia in this empire ought not to be confounded with the country of the same name in Lithuania, and that Red Russia belongs to Poland. Dr. Busching observes with respect to the origin of these names, that it is a custom among these eastern people, to distinguish countries by the epithets white and black; and that by the former, they call the most extensive and fertile, and by the latter, the smaller and less fruitful territories.

The Russian empire in Europe is divided into governments, and every government consists of certain provinces or circles. These governments have been frequently altered, but according to the present division, they are as follow: Kiew, Woranesh and Asow, Bielogorod, Smolensk, Great Moscow, Novogrod, Nishnoy-Novogrod, Archangel, Wiburg, Petersburg, Narva, Reval, and Riga. We shall begin with the countries bordering on Turkey and Poland, and for the sake of method, proceed from south to north.

The government of Kiew consists of part of Little Russia, and is inhabited by the Cossacs, which word signifies irregular troops of horse. The European Cossacs are, the Zaporog Cossacs, who live below the cataract of the Nieper, some on the side next to Russia, and others on the opposite side of the river; but most of them are subject to the Russians: the Bielogorod Cossacs, and a part of the Don Cossacs, both of which are under the Russian government.

The Cossacs were known by that name so early as the year 948, when they lived on mount Caucasus, and were reduced under the Russian dominions in 1021. In the beginning of the sixteenth century, the Zaporog Cossacs fixed their habitations on the spacious plains along the banks of the Nieper. The Poles, sensible of the advantage they might receive from their defending them against the incursions of the Tartars, took them under their protection in the year 1562, and engaged to pay them an annual subsidy, on condition of their keeping on foot a good body of troops, for the defence of the Polish dominions; and to bind them by ties of interest, gave up to them the whole country that lies between the rivers Nieper and Niester, and the borders of Tartary. The Cossacs so industriously cultivated that fertile tract of land, that in a short time it was interspersed with large towns, and handsome villages. They continually harassed the Turks by their incursions, and to prevent the latter from pursuing them, or making reprisals, seized on several small islands on the Nieper, where they kept their magazines.

This alliance, though of such advantage both to the Poles and Cossacs, did not long subsist; for the former envying the latter the fine country they possessed, attempted to bring them into subjection; upon which the Cossacs, fired with indignation, had recourse to arms, and applied both to Russia and the Ottoman Porte for protection. A very bloody war ensued, which, in the sixteenth and seventeenth centuries, was from time to time renewed with the utmost fury and animosity. The result of all was, that the Cossacs remained under the protection of Russia, and their former country being laid waste in the late wars, they settled in the Russian Ukraine; upon their receiving assurances from the Russian court, that they should be free from all taxes, and no alteration be made in their political constitution: in return for which, they were always to keep in readiness a considerable body of troops for the service of Russia. But in 1708, Mazeppa their hettman, or chief, went over from the Russians to the Swedes, under Charles XII. upon which Peter I. resolved to prevent such revolts for the future, and after the battle of Pultowa, sent a strong detachment into the little islands of the Nieper, to which the Cossacs had fled with their wives, their children, and all their effects, and cruelly ordered them, without distinction, to be put to the sword, and the plunder to be distributed among the soldiers. He also sent a great number of his men into their country, and caused many thousands of the Cossacs to be conveyed to the coasts of the Baltic, where they were put to all manner of hard labour.

Upon the death of their hettman in 1722, that office was abolished, but was restored again in 1750, when

they elected for their hettman count Rasumowsky, privy counsellor of the Russian empire, president of the academy of sciences, and lieutenant-colonel of the Ishmailow regiment of life-guards; and this election was confirmed by the reigning empress Elizabeth.

The country of these Cossacs is commonly called the Ukraine, which word properly signifies a frontier; it lying on the borders of Russia, Poland, Little Tartary, and Turkey. By virtue of a treaty concluded in 1693, between Russia and Poland, the latter remains in possession of all that part of the Ukraine that lies on the west side of the Nieper, which is but indifferently cultivated; while the country on the east side, inhabited by the Cossacs, is in a much better condition.

This country, which is subject to Russia, extends about three hundred miles in length, and about as many in breadth. It is one continued fertile plain, watered by a great number of fine rivers, and diversified with pleasant woods. It produces all kinds of grain, pulse, tobacco, honey, and wax, in such quantities, as to supply a great part of the Russian empire with those commodities. The pastures are extremely rich, and the cattle of an extraordinary size; the rivers also abound with excellent fish. This fine country, however, is very much infested by locusts, which are a great plague to the inhabitants.

Most of the houses of the Ukraine are built with wood, after the Russian manner. The Cossacs are tall, and well made; they have generally an aquiline nose, and a good mien. They are vigorous, hardy, brave, and very jealous of their liberty; fickle and wavering: but sociable, chearful, and sprightly. Their forces entirely consist of cavalry. Their dialect is a mixture of the Polish and Russian language; but the latter is most predominant. They profess the Greek religion; but there are also some Protestants and Roman catholics among them; in short, they are a very powerful people. Every town, with the district belonging to it, is governed by an officer called attaman, or ottoman.

The Don Cossacs, who inhabit the banks of the river Don, greatly resemble those we have been describing. In 1549 they voluntarily put themselves under the protection of the czar Iwan Basilowitz, and are at present nearly on an equal footing with the other Russian subjects. These Cossacs have a great number of towns and villages along the banks of the Don; but the scarcity of wood, and in many places of fresh water, prevents their extending themselves farther up the country. They chiefly subsist by grazing and agriculture, and occasionally by robbing and plundering. Every town is governed by a magistrate, whom they call taman; and the tamans, with their towns, are under the jurisdiction of two attamans, who reside at Tsherkasky. The troops of these Cossacs likewise consist entirely of cavalry. Every town and village in this country is fortified and surrounded with palisades, to secure them against the incursions of the Calmucs and Kuban Tartars, with whom they are always at war. The Cossacs in general are of great service in garrisoning of towns and defending them, or in pursuing an enemy; but are not so good at regular attacks.

The Haidamacs have their particular hettman, and live in the Russian, Polish, and Turkish dominions, along the banks of the Nieper.

The Yaik Cossacs live on the south side of the river Yaik, and on the success of the Russian arms in the kingdom of Astracan, voluntarily submitted to them. In stature they much resemble the other Cossacs, though from their boorish manner of living, and intermarrying with the Tartars, they have not the shape and air peculiar to the rest of their countrymen; but resemble them, however, in their natural dispositions and customs. Their chief employments are agriculture, fishing, and feeding cattle; and, like the other tribes, they seldom let slip an opportunity of robbing their neighbours. Their continual wars with the Kara Kalpacs oblige them to keep their towns and villages in a state of defence. They are indeed subject to Russian waywodes, to whom they annually pay a tribute in cattle, corn, honey, and wax; but have their particular chiefs, who govern them according to their antient customs. The greatest part of the Yaik Cossacs profess the Greek religion; but many relics of Mahometism and Paganism are still to be found amongst

amongst them. They are remarkable for their hardiness and courage, and make excellent soldiers. They live in peace, and even carry on a commercial intercourse with the Calmucs.

The government of Kiow consists of ten circles, the most considerable cities of which are Kiow and Pultowa.

Kiow, or Kiew, the capital of this government, which is situated on the Nieper, is said to have been founded by Kius, a Slavonian prince, and, according to the Polish writers, was built in the year 430; but this account is not to be depended upon. However, in the year 1037, the great duke Jaroslaw declared it the capital of all Russia; and it continued to be the residence of the great dukes till the twelfth century. It afterwards fell into the hands of the Poles; but, in 1667, they restored it to the Russians for a certain term of years, and in 1686 ceded it to Russia for ever.

This city properly consists of three small towns, the castle of Petshersky, with its suburbs; the old city of Kiow; and the town of Podol, which lies below the latter: these are partly inclosed with a common fortification, and in other parts have a communication by a large intrenchment, carried on as the inequality of the mountains would permit. The whole garrison consists of seven regiments of foot, and is governed by a statthalter general, a deputy statthalter, and a commandant.

The castle of Petshersky stands on an eminence facing the south, and, besides magazines, barracks for the garrison, officers houses, and some churches, includes a rich and stately monastery, founded in the eleventh century, and called Petshersky, from the monks formerly living in a petshera, or cavern, in the mountain on which the convent now stands. In its subterraneous vaults, which resemble a labyrinth, and contain chapels, cells, &c. are found a great number of undecayed bodies, supposed to be the remains of saints and martyrs; and here the bodies of the deceased monks are also deposited. Opposite to this monastery formerly stood a nunnery, which is now converted into a magazine. The suburbs of Petshersky are very large, consisting of houses belonging to the above-mentioned convent; and also of several convents and churches, the principal of which is the convent of St. Nicholas.

Old Kiow is seated on an eminence facing the north, and is fortified, according to the mountainous nature of the country, with horn-works, &c. Here stands the cathedral of the Greek archbishop of Kiow, Halitsk, and Little Russia, who resides in the convent of St. Sophia. To this church and the convent of St. Michael belong most of the houses in the city.

Podol is situated below Old Kiow, in a plain on the banks of the Nieper, and, except its churches and convents, consists entirely of shops and tradesmen's houses. Its magistrates are independent of the colonels of the regiments in garrison, and receive their orders immediately from the war-office at Glucow. The academy adjoining to the Bratskoi monastery, near the town-house, is entirely built of stone, and is one of the noblest edifices in the city. The university of Kiow has the archbishop for its principal, and under him are two officers, who have the care of the students. There are nine professors, who live in a wooden building, to which belongs a delightful garden: these are all monks, and are not to taste flesh throughout the whole year; but are said to make little scruple of transgressing this rule in private. Their salaries are but small, so that they are chiefly maintained by the stipends and presents they receive from the students, who amount to about one hundred. Public lectures in all the sciences are read to them, and they also perform several exercises, according to the custom of other universities, as public disputations, and the like, besides some others peculiar to themselves. While this city was subject to the Poles, the papists had a bishop, a Dominican convent, a college of Jesuits, and several churches there, which are all suppressed, and appropriated to the use of the professors of the Greek religion.

Pultowa, or Pultawa, a town situated on the river Workla. This town, with the regular fort belonging to it, is subject to a commandant, and not to the colonel of the regiment of Cossacs in garrison there. The burghers carry on a considerable trade to the Crimea,

and through Poland to Germany. It is but an indifferent town, built in the manner of those of the Cossacs; but was rendered famous by its being besieged by the Swedes in 1709, and by its falling into the hands of the Russians after the defeat of Charles XII. near this place. The king of Sweden had his head-quarters at a monastery which stands upon an eminence without the town.

S E C T. X.

Of the Governments of Woronesh and Asoy, Bielogorod, Smolensk, and Nishnei Novogrod; the Number of Circles into which each is divided; and a concise Description of the principal Towns they contain.

THE government of Woronesh and Asoy includes six districts, the most remarkable places of which are,

Woronesh, a large and populous provincial city, seated in a narrow, but very deep, river of the same name. It is surrounded with a wall, and is the residence of the statthalter, or governor, and a bishop's see. Most of the streets, instead of stone pavements, are laid with beams of timber. Peter I. in order to maintain his sovereignty over the Black sea, caused a large dock to be made for building of ships, which drew many new inhabitants thither, among whom were several foreign artificers. This city carries on a considerable trade.

Bachmut, on a river of the same name, is situated partly on an eminence on its western bank, and partly in a plain on the east side of that river. The former is defended by a citadel, and indeed the whole town is fortified for the security of the salt-works. The imperial salt-office at Bachmut maintains a battalion of regular troops, and a company of Cossacs, consisting of a hundred men. The country, which is situated between the Donez, the Don, the Black sea, Mius, and Kalmius, exceeds all the rest of Little Russia in fertility; and has also several spots that are supposed to contain rich ore.

The Don Cossacs who dwell in this government are possessed of many small towns situated on the rivers Don and Donez. Their capital, named Tsherkask, is the residence of the attoman. It is built in the Turkish manner, and part of it encompassed with high palisades fixed on the Don. This city is of large compass; it is inhabited by a great number of Asiatics, and carries on a great trade.

At the distance of four wersts is the city of St. Anna, a new town, regularly built and fortified by the Russians. It is but small, and is seated low on the banks of the Don. It has six bastions and the necessary out-works, with a garrison consisting of two marching and two garrison regiments. The houses are well built, the streets broad and straight.

The government of Bielogorod contains part of Little Russia, and is divided into five districts.

The capital of the government is Bielogorod, which stands on the river Donez, and was built in the year 990. About an English mile from the town is a large chalk hill, where Bielogorod formerly stood, and from which it derives its name, which signifies a white town; but it was afterwards built in a valley between two mountains. It is divided into the Old and New Town; it has three suburbs, and is a bishop's see. The Old Town is surrounded with a rampart and moat, and the New Town with palisades.

The government of Smolensk contains White Russia, properly so called, which was ceded by Poland to Russia by a treaty concluded in 1667, and confirmed in 1686.

The most remarkable place in this government is,

Smolensk, a large and well fortified town on the Nieper, the residence of the governor, and a bishop's see. It carries on a considerable trade, and is famous in history from its being the subject of many disputes between the Poles and Russians; during which it was often besieged and taken by both parties.

The government of Nishnei Novogrod is inhabited by the following tribes: the Morduans, whose language is said to resemble the Finlandish dialect; the Tsheremissians, distinguished into the Logowoi, who inhabit the plain on

the left side of the Wolga; and the Nagornoi, who live among the mountains on the right side of that river. The former belong to this government; but the greatest part of the latter to that of Casan. The Tshuwashians, who live dispersed in this government and that of Casan, are a numerous tribe. They worship one supreme God, whom they call Tora, and consider the sun as a kind of subordinate deity, to whom they pay their adorations; and they have several other inferior deities, which, they say, hold the same rank with the saints of the Russians. Every village has its own idol erected in a square, inclosed with palisadoes. They perform their devotions to it near a fire, where they offer a sheep to the idol, and hang up the skin for a trophy in honour of it. The person who performs this sacrifice, to whom they have recourse in every difficulty, is stiled Yumasse; and both sexes are capable of this religious office. Great numbers of these Pagans have been baptized; and throughout all the Russian towns in the districts where they live schools have been erected, for instructing their youth in the principles of the Christian religion, in order to qualify them for being missionaries among their own tribe. This government contains four circles, and the principal place in this jurisdiction is Nishnei Novogrod, that is Lower Novogrod, which is a large provincial city seated on the Wolga, at the influx of the river Oka. It was built in the year 1222, and has two cathedrals, twenty-eight parish churches, most of which are built with stone, and five convents. It is an archbishop's see, and is defended by a castle surrounded with stone-walls. The trade of this city is very considerable, and the shops make a handsome appearance, from their being richly furnished with all kinds of foreign goods, as well as those made in Russia. In the year 1715 a great fire broke out here, in which some thousands of the inhabitants lost their lives.

SECT. XI.

Of the Government of Moscow; with a particular Description of the Capital of the same Name.

THE government of Moscow is the best cultivated and the most populous in the whole empire, and may be called the garden of Russia. It contains eleven provinces, the principal places in which are the city of Moscow and Yaroslavl.

Moscow, the antient capital of the Russian empire, and the residence of the czars, is situated in the circle of its own name, in the fifty-fifth degree forty minutes latitude, and the thirty-eighth degree east longitude; fourteen hundred and fourteen miles north-east of London. It stands in a pleasant plain on the bank of the river Moskwa, from which it derives its name. Mr. Hanway says, that river runs through it, and, making many windings, adds a very striking beauty to the city; but in summer it is in many places shallow and unnavigable. Several eminences, interspersed with groves, gardens, and lawns, form the most delightful prospects. It is built somewhat after the eastern manner, it having but few regular streets, and a great number of houses with gardens. The number of the churches in the city is computed at sixteen hundred, among which are eleven cathedrals, and two hundred and seventy-one parish churches; the rest either belong to convents, or may be considered as private chapels. Near the churches are hung up several large bells, which are kept continually chiming. One of these is of a stupendous size, and, our author observes, affords a surprising proof of the folly of those who caused it to be made; but the Russians have from time immemorial been extremely fond of great bells. This bell is four hundred and forty-three thousand seven hundred and seventy-two pounds weight, and was cast in the reign of the empress Anne: but the beam on which it hung being burnt, it fell, and a large piece is broke out of it. Many of the churches have gilt steeples, and are magnificently decorated within with paintings; but indeed most of these are miserable daubings, without shade or perspective.

The number of public edifices and squares at Moscow amount to forty-three. The mean houses are indeed much more numerous than those that are well built; the latter are, however, daily increasing; but, as only a part of the streets is paved, they are very dirty.

The city is divided into four circles, one within another. The interior circle, or the Kremlin, which signifies a fortress, contains the following remarkable buildings: the old imperial palace, pleasure-house, and stables, a victualling-house, the palace which formerly belonged to the patriarch, nine cathedrals, five convents, four parish churches, the arsenal, with the public colleges, and other offices. All the churches in the Kremlin have beautiful spires, most of them gilt, or covered with silver. The architecture is in the Gothic taste; but the inside of the churches is richly ornamented; and the pictures of the saints are decorated with gold, silver, and precious stones. In the cathedral called Sobor, which has no less than nine towers, covered with copper double gilt, is a silver branch, with forty-eight lights, said to weigh two thousand eight hundred pounds. Here are deposited, in silver shrines, the remains of three archbishops; and in a gold box is a robe brought from Persia, which is here looked upon as the identical garment worn by our Saviour. The remains of the sovereigns of the Russian empire, and their male descendants, are interred in St. Michael's church; and those of their consorts, and the princesses, are deposited in the convent of Tshudow. All these structures are lofty, spacious, and built with stone. This circle is three hundred fathoms in diameter, and surrounded with very high and thick walls, flanked with six towers, planted with cannon, and also defended by deep moats and ramparts.

From the above circle you pass over a handsome stone bridge into the second, which is called Kitaigorod, or the Chinese-town. There are here five streets, two cathedrals, eighteen parish churches, four convents, thirteen noblemen's houses, and nine public edifices: these are the chief dispensary, in which the medicines are kept in vessels of China porcelain, decorated with the imperial arms; and from this place the whole empire is supplied with medicines: the mint, which is a superb structure: a magazine, or warehouse, to which all goods are brought before they have paid duty: the custom-house: the ambassador's palace, which is now converted into a silk manufactory: a printing-house: a court of judicature: the physic garden: and the exchange, in which are about six thousand handsome shops; here all commercial affairs are transacted, particularly what relates to the trade with China, whence this circle contains many merchants. This part of the city is fortified with a pretty high wall, strengthened with twelve towers and strong bulwarks.

The third circle surrounds the former, and is named Belgorod, or the White Town, from a white wall with which it is encompassed. It is also called the Czar's Town. The Neglina runs through this part of the city, from north to south; but though there are in this circle several kneses, bojars, merchants, and tradesmen, it is in many parts very dirty, and most of the houses are very mean. It includes seventy-six parish churches, seven abbeys, eleven convents, and nine public edifices: these are two palaces, a cannon foundery, two markets, a brewhouse, a magazine of provisions, the salt-fish harbour, and the Basil garden. At the timber-market are sold new wooden houses, which may be taken to pieces and put together again, where the purchaser pleases.

The fourth circle, called Semlanoigorod, that is, a town surrounded with ramparts of earth, incloses the three preceding parts, and its ramparts include an area of great extent. The entrance was formerly by thirty-four gates of timber, and two of stone; but at present only the two last are standing. Over one of these gates is a mathematical school, and an observatory. This circle contains a hundred and three parish churches, two convents, an imperial stable, an arsenal for artillery, a mint, a magazine for provisions, and a cloth manufactory. Round these principal parts of the city lie the suburbs, which are of great extent, and contain sixty parish churches and ten convents. These suburbs resemble the villages

villages in other parts of the country, except the German quarter, which is the largest and handsomest, and contains two Luthern churches, a grammar school, a Calvinist church, and a Romish church. This suburb is situated towards the east on the river Yauza; to the west of it lies the palace of Annenhof, which has a good garden; and towards the north is a large and stately hospital. Farther to the west stands the palace of the empress Elizabeth.

The number of inhabitants are supposed to amount to about a hundred and fifty thousand. These consist of statesmen, noble families, and their servants, merchants, priests, monks, and servants belonging to the churches, mechanics, labourers, carriers, and sledge drivers.

Moscow has greatly declined since the building of Petersburgh, and its being made the seat of the empire. An university and two gymnasia, or seminaries, were founded here in the year 1755. Moscow has often suffered by fires, and in 1737, 1748, and 1752 a considerable part of it was reduced to ashes, especially by the last fire, which consumed above half the city, together with the noble dispensary and the czarina's stables. But the houses are always soon rebuilt after such a calamity, they being for the most part formed of very mean materials. The gardens in its neighbourhood yield a variety of fruit, and are particularly famous for the transparent apple, called by the Russians *naliwy*.

In this government are several considerable places, among which is *Garoslaw*, a large and well built town, the capital of a circle of the same name; it has a good trade, and is celebrated for its Russian leather. The shops in the large exchange make a very grand appearance, and are well stocked both with home and foreign goods. Here is also a considerable manufacture of all kinds of linen and flowered woollen stuffs. The Russian church, which stands near the manufactory, is built in the German taste, and has few equal to it in this country.

One of the most remarkable places in the circle of Moscow is the convent of the Holy Trinity, which is the largest and best endowed of any in Russia; the number of peasants who are its vassals being no less than twenty thousand. It is situated at the distance of sixty wersts from Moscow, and is built in a quadrangular form, in the old Gothic taste. It is inclosed with strong walls, ramparts, and moats, and is always garrisoned by a company of soldiers. The convent itself is a spacious, lofty, and handsome structure. The great church is very splendid, and has a fine tower, in which are several valuable bells. Besides the principal church there are nine others, and a grammar school, within the inclosure of the convent. The number of monks who reside here is said to amount to about six hundred. This was the place where Peter I. took shelter after he had narrowly escaped the hands of the *Strelitzes*, who had been spirited up against him by *Sophia* his half sister. It has been an antient custom for the sovereign of the Russian empire to go in pilgrimage to this place. Here are several dead bodies, which, from natural causes, remain undecayed. There is a small town near the convent.

S E C T. XII.

Of the Governments of Archangel and Novogrod; with an Account of the Samoides, in the former Government; and the principal Places in each.

THE government of Archangel includes a part of Lapland, of which we shall give a more particular account in treating of Sweden; but, as great numbers of the people called Samoides live in this government, it will be proper to take some notice of them.

The Samoides inhabit the coast of the northern ocean both in Europe and Asia, and we have already given some account of them in treating of Siberia. The word Samoiede is said to signify man-eater, it being imagined, without any foundation, that these people devoured their deceased friends and the prisoners taken in war. The Samoides that live in the government of Archangel are entirely separated from the rest of that nation, and as it were excluded from any intercourse with them. They

have also a different language; yet as to their religion and customs, they entirely agree. They are low of stature, and their feet, especially those of the females, are remarkably small. Their tawny complexion, longish eyes, and puffed cheeks, give them a very disagreeable appearance in the eyes of strangers. They are poor, simple, and undesigning.

Their winter-dress is made of the skins of rein-deer, with the hairy side outwards; and the cap, coat, gloves, breeches, and stockings, are generally sewed together; so that the whole suit makes but one piece. In summer they wear fish-skins, and instead of thread use the nerves of wild beasts cut into long filaments.

They all subsist by hunting and fishing: the flesh of rein-deer, bears, seals, fowls, dried fish, and turnips, being their usual food. The flesh they eat partly raw and partly boiled. Their weapons for hunting are javelins, bows, and arrows pointed with bone; they have also some darts bearded with iron. When they find it difficult to subsist in one place, they remove to another. Their summer huts are covered with the bark of birch trees; but in winter, with the skins of rein-deer. Their whole riches, and all they possess consists in tents, cloaths, and rein-deer. Both sexes wear the same kind of dress, and as their features are equally disagreeable, it is not easy to distinguish them.

Their marriages are attended with no other ceremony than merely an agreement between the parties; but though polygamy is not prohibited among them, few of them have more than one wife. The Samoides, like the *Ostiacs*, call their new born children by the name of the first animal they meet, or if they first happen to meet a relation, he generally names the child.

Before they were brought into subjection to the Russian government, the only punishment among them was to sell the perpetrator of any heinous crime, as murder, &c. together with his whole family, for slaves. But the Russian laws are now introduced into the principal places in this country.

They know very little of a Supreme Being, but pay their adorations to misshapen wooden images of men, beasts, birds, and fishes. They also pay a kind of worship to the heads of beasts of prey, particularly those of bears, which they put up in the woods, and fervently pray to. Their priests, whom they term *shamans*, or *codeznics*, are chosen from among those who are most advanced in years, and these they imagine can make known to them the will of their gods, foretell future events, and by their strange gestures, and ridiculous grimaces, perform all kinds of magical operations.

Before the reign of the czar *Iwan Basilowitz*, the only magistrate among them was the oldest man in the family or village, to whom the rest were subject. But in his reign, a person called *Anica Stroganow*, sent his son to make discoveries in this country, who on his return made an ample report to the government. The Russians were not a little fond of the fine furs it produced, and the czar immediately ordered several forts to be built in different parts of the country. The Samoides readily submitted to pay a tribute of furs, which was imposed on them, and by degrees the habitable places were peopled by Russian colonies and governors. The Samoides made two attempts to shake off the Russian yoke; but were soon reduced. They have the finest furs in all the Russian empire, which they dispose of to the Russians for trifles, and when they meet with ill success in hunting and fishing, they exchange them for meal; this they mix with water, and eat it out of a kettle which always hangs over the fire.

In this government are twelve circles, the most considerable places in which are:

Archangel, the capital of this government, which is situated in sixty-four degrees thirty-four minutes north latitude, and in forty degrees twelve minutes east longitude from London, on the banks of the river *Dwina*, about four miles from its entrance into the White Sea. This city is about three English miles in length, and one in breadth, and the houses are all built of wood, after the Russian manner, except the exchange of the merchants, which is of stone. The citadel, where the governor resides, is surrounded with a kind of wall made of large

large pieces of timber. This city is a bishop's see; but both the Lutherans and Calvinists have their respective churches there.

The foundation of its commerce was laid by the English in the year 1553, and the advantages they reaped from the Russia trade, soon prompted other nations to put in for a share of it. Provisions are there sold very cheap; but the gradual increase and prosperity of Petersburg has made this city decline in the same proportion. A post has, however, been established for the convenience of trade between this town and Petersburg.

Ustjug Weliki, or Great Ustjug, the principal town of a circle of its own name, is situated near the conflux of the rivers Sucfona and Jug; but formerly stood at the mouth of the latter, from which it derives its name. This city is about three wersts and a half in length, and half a werst in breadth; it contains twenty-three churches, besides five convents, and is an archbishop's see. Though it is situated in sixty-one degrees fifteen minutes latitude, yet the fruits of the earth often come to maturity. It has a communication by water with Archangel and Wologda, which renders it so convenient for trade, that most of its inhabitants are merchants, and some of them are very wealthy. Those who go from Archangel to Siberia, generally pass through this city.

The last place we shall mention in this government is that of Wologda, which is also a provincial city, and stands on a river of the same name. It has seventeen hundred dwelling houses, sixty-eight churches, two convents, with four churches, and a German suburb, tho' very few of that nation at present live there. It has also two suburbs inhabited by sledge drivers, in which are two churches, besides a convent of monks, which has four chapels. This city, which is the see of an archbishop, was formerly in a flourishing condition, and carried on a considerable trade. Its commerce now consists of hemp, hemp-seed, and matting, made of the bark of lime-trees, which the inhabitants send to Archangel in a few large barges that belong to the town: they also send Russia leather and tallow by land to Petersburg. Archangel, on the other hand, supplies Wologda with foreign commodities, which are sold here very cheap. Most of the inhabitants of this town are traders: the Dutch and Germans have been settled here for a long time past, and upon the taking of Narva, the greatest part of the inhabitants who were made prisoners, was sent to this town, where they provided for themselves so well by their industry, that they returned back with reluctance.

The government of Novogrod or Nowogrod, includes the dutchy of the same name, or the island of Great Novogrod, conquered by the Russians in 1478. In this country lies the lake of Ilmen, from which the river Wolcow runs; and those great rivers called the Wolga, Nieper, and the Polish Dwina, have also their sources in this province. This government includes five circles or districts, the most remarkable places in which are,

Great Novogrod, the capital of a circle, and a very ancient, large, and celebrated city, seated on the river Wolcow, just where it runs out of the lake of Ilmen. This is a place of considerable trade, and the seat of a governor. It was first built in the ninth century by the Slavonians, and was a famous staple of the Hanse-towns, till the year 1494, when it grew so powerful, that it became a proverbial speech, "Can any body withstand God and Novogrod?" But by frequently falling into the hands of its enemies, and the many conflagrations, which, from time to time, have happened in this city, it is so far reduced, as to have scarce any remains of its former grandeur. The churches and convents are alone worthy of notice, the rest of the town consisting of small wooden houses; it is, however, an archbishop's see.

St. Anthony's convent is situated by the river Wolcow, about two wersts from Novogrod, and is the principal monastery in the country. St. Anthony, its founder, was buried there in 1147, and besides his monument, here is shewn a mill-stone, on which his votaries firmly believe, and gravely assert, that he sailed from Rome to this place. They have also some other curiosities of the same ridiculous kind.

Twer, which is also a provincial town, lies on both sides the Wolga, at the influx of the river Twerza. It is large and populous; for it has seventy churches and convents, and carries on a considerable trade in corn. It is at present an archbishop's see, and was formerly the residence of several great dukes and princes.

SECT. XIII.

Of the Provinces conquered by the Russians, and first of the Dutchie of Livonia and Esthonia. Their Situation, Climate, Produce, and Inhabitants. Their Government and History; with a Description of Riga, the Island of Oesel, and the Cities of Reval, Narva, and other considerable Places in these Dutchie.

WE now come to the provinces acquired by Russia, in the present century: these are Livonia, Ingria, and Carelia. We shall begin with the dutchie of Livonia and Esthonia, which were formerly inhabited by three different nations, the Livonians, Lettonians, and Esthonians, whence it became divided into Liefland or Livonia, Lettland, or Lettonia, and Esthland, or Esthonia. In common conversation Livonia includes the country properly so called, together with Lettonia and Esthonia; but, to speak with greater precision, Livonia, or the south part of the country, ought to be distinguished from Esthonia, or the north part.

Livonia and Esthonia border on Courland, the Baltic, the gulph of Finland, Ingria, Russia, and Poland; it extending in length from north to south between two hundred and fifty and three hundred miles, and its breadth from east to west, is from two hundred to two hundred and forty miles, exclusive of the islands belonging to it.

Livonia consists partly of woods and morasses, and partly of a fertile soil, that yields the inhabitants great plenty of all the necessaries of life. The air is clear and salubrious; and though the winter be long and severe, and consequently the summer short, yet the heat of the climate, during the latter season, is such, that the grain sown both in winter and summer ripens at the proper time. In a plentiful year the inhabitants export many thousand lasts of barley and rye to Holland, Spain, and other foreign countries, whence Livonia has been termed the granary of the north. Before the corn is threshed, it is dried and hardened in kilns, heated by large stoves built contiguous to their barns; yet this renders it neither unfit for sowing, nor for making bread and malt, though it has the advantage of making it keep the better.

Formerly this country was over-run with vast woods of oak, fir, pine, and birch trees; but these are now too thin, partly from the method of building practised by the inhabitants, whose houses and other edifices, both in the towns and villages, consist almost entirely of wood, and partly by their clearing of the woods, in order to prepare the land for sowing of corn. The country, however, has reaped one advantage from the want of trees, it being less infested with bears, wolves, elks, lynxes, martens, and other wild beasts: yet Livonia still abounds with the smaller wild quadrupeds, and other game; so that hares, which turn white here in winter, and wild fowl, are sold very cheap; but there are neither deer nor wild boars in this country. The horned cattle, horses, and goats of Livonia are, however, very numerous, and much esteemed; but the sheep are not extraordinary, their wool being coarse, and resembling goats hair.

Vast quantities of flax, hemp, linseed, leather, and skins, are exported from hence in foreign bottoms.

The rivers which water this country are the Duna, the Aa, the Embac, the Pernaw, &c. It has likewise many standing lakes, as that of Peipus, the lake of Werczer, which is thirty miles in length, and twelve in breadth, the lake of Luban, and some others. Both these lakes and rivers afford plenty of the finest salmon and other fish. Turbots are also taken in the gulph of Riga, and a considerable part of the inhabitants are supported by the fisheries. Stromlings, a species of herrings, are found in vast shoals along these coasts, and are the common food

food of the peasants, who salt great quantities of them. A Swede has in the present reign established a pearl-fishery, and there are above forty-five rivulets and lakes in Livonia and Esthonia where this fishery is carried on; but the latter yield more pearls than the former, and those nearly equal the oriental pearls both in size and clearness.

The highways and roads in Livonia are in very good order, and at the end of every Russian werst a red pillar is erected, on which is marked the number of the wersts passed and remaining, in travelling from one capital to another.

This country was formerly interspersed with a multitude of towns and villages; but most of them have been destroyed in the wars which Livonia has so often experienced; and the ruins of many of them are to be seen. Indeed a traveller passes through more towns in a journey of eighty or ninety miles in many countries, than in all this extent of land. To the same cause may be attributed the scarcity of money observable among the Livonian peasants, who, amidst all their affluence, find such difficulty in turning the overplus of their substance into money, that it is said they are obliged to give half of it away, and at the same time they buy whatever foreign commodities they have occasion for at a very high price.

Livonia might doubtless afford subsistence to a much greater number of inhabitants than it has at present; for they have been extremely thinned by war, pestilence, and famine. Their number may in some measure be determined by the following method: the estates are taxed according to the number of hakes, that is of men fit for labour from fifteen to fifty years of age, five of these being reckoned to a hake. The peasants of Esthonia are said to consist only of five thousand hakes, which only amount to twenty-five thousand labouring men, a number that must appear very inconsiderable for so large a province.

Besides those of the inhabitants who are of German extraction, this country contains a great number of Esthonians and Lettonians, who are of a different race, and have a different language; but their manners and customs are nearly the same. The Esthonians seem, from the affinity of the two languages, and other circumstances, to have descended from the same origin as the Fins; but the Lettonians, both from their name and language, appear to be sprung from the same stock as the Lithuanians, who are a mixture of several Sarmatian tribes. The stature of both seldom exceeds the middle size; but they are vigorous and hardy, enduring cold and heat, and cheerfully undergoing the greatest labour and fatigue. Their houses are meanly built, and the rooms quite black with smoak. They are all vassals, or rather slaves, to their lords, who may treat them as they please; so that they do not kill them. Their chief employments are agriculture, grazing, and sometimes fishing; yet they have a good natural genius for mechanics. They are, however, addicted to drunkenness, and still practise in private many superstitious customs. The languages usually spoken by the inhabitants are the German, the Lettonian, the Esthonian, the Russian, the Swedish, and that of Finland.

The nobility of this country are very numerous, and are mostly of foreign extraction; for their ancestors were partly such families as antiently came into Livonia with the king of Denmark; but for the most part removed hither from Germany. Here are also some noble families of Swedish and Polish extraction. The greatest part of the nobility have always applied themselves to a military life; and the others who reside on their estates, and make improvements in agriculture, are generally invested with civil employments. The nobility are far from being sufferers by falling under the dominion of Russia; for since that time all their rights and privileges have been confirmed to them, and the estates which the court of Sweden had reassumed have likewise been restored.

Artificers and mechanics are less common here than in other countries. The commerce of Livonia always flourishes in time of peace; however, the trading towns on the coast suffer greatly by the clandestine trade carried on by land; and, though it has been often prohibited, it still increases. The gentry purchase corn both of their

vassals and other peasants: some of them distil spirits from it, while others send it to the sea-ports, and sell it there to great advantage. The peasants are obliged to bring what corn they intend for sale to the noblemen's seats, where, instead of having ready money for it, they generally receive iron, salt, tobacco, and other utensils and commodities.

The inhabitants of Livonia chiefly profess Lutheranism; but the Calvinists, Russians, and Papists, are indulged with the free exercise of their religion. The Bible has been here published in the Lettonian and Esthonian languages; and there is an annual allowance from the crown of twelve hundred rubles towards the support of the national churches in this country; but the churches of the separatists do not partake of this bounty.

All the country parishes in Esthonia, together with the cathedral of Reval, with regard to ecclesiastical jurisdiction, are subject to the nobility, and are but forty in number; whence we may form a conjecture of the great extent of those parishes. The consistory of nobles is composed of a president, who is a provincial counsellor, provosts, the preachers belonging to the cathedral of Reval, and some other assessors. Here is likewise a supreme court of appeals in spiritual causes, which consists of some ecclesiastics, provincial counsellors, and noblemen. Livonia, or the general government of Riga, contains above a hundred and twenty parishes, which, together with St. James's church in Riga, are under the jurisdiction of the consistory of nobles: over these presides a general superintendent, who resides at Riga, where is also held the high consistory. Every circle has a governor in civil and military affairs, who must be of the class of the nobility. The ministers of Pernau, Dorpt, and other small towns in Livonia, are subject to the general superintendent; but the cities of Riga, Reval, and Narva, have their own consistories, which, as well as the magistracy, are independant of the nobility.

The highest tribunal in Esthonia is the supreme provincial court, called the government, which annually meets to administer justice about the middle of January, and continues sitting till Easter. It consists of the governor, as president, and twelve provincial counsellors, who are all nobles, and have the rank of major-general. The provincial counsellors may fill up the vacancies in their college, without any licence from the crown, from among the nobility; and the senior provincial counsellors compose a government, in the absence of the other governors.

Subordinate to this tribunal are inferior judges, who hold inferior courts. The inferior judge of every circle in Esthonia has two assistants. His office is to take care of the roads and bridges; to levy the money granted by the nobility at the diet, for the public service; and all disputes about limits and other incidents have the first hearing before him. Subordinate to the supreme council is also another court, called man-gericht, which consists of a judge, two assessors, and a notary. These take cognizance of all criminal affairs, and disputes of more importance. An appeal also lies from the former of these inferior courts to the man-gericht. The judge of both these courts must be of the class of nobles, and continues in office only three years.

In the general government of Livonia the chief tribunals are the supreme court of judicature appointed by the czarina, and also two inferior courts. But from all these courts there lies an appeal to the college of judicature established at Peterburgh, for the provinces of Esthonia and Livonia, and from that again to the senate, which is the supreme tribunal for the whole Russian empire.

With respect to the history of these countries, paganism prevailed till the twelfth century, when the Christian religion was first introduced into Livonia. In 1158, some merchants of Bremen, bound to Gothland, were driven by stress of weather on the coast of Livonia; but the inhabitants at first opposed their landing, yet by degrees grew familiar, and traded with them. Of this the merchants of Bremen took advantage, by resorting thither in greater numbers with commodities to trade with the natives; and, with their consent, went about six miles up the Duna, where they pitched their tents.

Afterwards they built a strong warehouse of timber on an eminence, in which they deposited their goods. The Germans increasing in number, brought with them, about the year 1186, an Augustine monk, named Meinhard, who, having learned the language of the country, persuaded some of the inhabitants to be baptized. By this time, instead of a single warehouse, the Germans had formed a town, which was named Uxkul, and this they now built with stone, and erected a castle at the foot of the hill. Meinhard founded a church and convent of Augustine monks in this town, which was soon erected into an episcopal see, of which he was the first bishop.

About the year 1196, Canute VI. king of Denmark, entering Esthonia, subdued that province, introduced Christianity, erected churches in the country, and sent priests to officiate in them. Bishop Albert, in order to promote the conquest of Livonia, instituted the order of knighthood called the Knights of Christ, and pope Innocent III. granted them the same statutes as the Knights Templars, with a cross and sword, as a badge to be worn on their coats; enjoining them, at the same time, to obey the bishop of Riga. In the year 1206, bishop Albert granted to the order the third part of Livonia, with all the privileges of sovereignty, which was confirmed by pope Innocent III. who exempted the knights from tithes and other imposts. In 1231 they were solemnly united with the knights of the Teutonic order, and, as their habit was a white mantle, with a black cross, they styled themselves Brothers of the Cross; a title which they afterwards changed to that of Lords of the Cross. At length the king of Denmark sold Esthonia to this order, and in 1521 their general purchased from the grand master of the Teutonic knights in Prussia the chief jurisdiction in Livonia; at the same time they were discharged from their oath of obedience to the Teutonic grand master. Soon after the emperor Charles V. admitted them among the princes of the empire, by which they had a right of appealing from their high court of judicature to the Aulic council at Spire.

About the middle of the sixteenth century the czar Iwan Basilowitz formed the design of conquering this country, which induced the city of Reval and the duchy of Esthonia to put themselves under the protection of Sweden, on which was grounded the claim of that crown to Livonia, and the superior privileges enjoyed by Esthonia above Livonia. Gotha Ketler, chief of the order, also gave up Livonia to the king of Poland, and having solemnly resigned his command, was created first duke of Courland, which he was to hold as a fief of Poland. The Poles likewise got possession of Riga and Lettonia; but now this country became the scene of the most bloody wars between Russia, Sweden, and Poland, which lasted for a whole century; but by the peace of Oliva, concluded in 1660, Livonia was given to Sweden, and the Duna was agreed to be the boundary between the Swedish and Polish dominions.

At length, in the famous war which broke out in the North in the beginning of the present century between Peter the Great and Charles XII. of Sweden, this country was miserably ravaged, till by the treaty of Nystadt, concluded in 1721, Sweden ceded Livonia, Esthonia, and Ingria, with a part of Carelia, &c. for ever to Russia; when his czarish majesty engaged to preserve and maintain the inhabitants in the enjoyment of all the rights and privileges they had possessed while under the dominion of Sweden, and to permit the Lutheran religion, with the churches, schools, and all the endowments, to continue on the same footing as under the Swedish government; granting the professors of the Greek religion only an entire liberty of conscience, and the free exercise of their religious worship.

In 1741, Sweden attempted the recovery of part of these ceded countries; but this was only attended with a loss of part of Finland; and by the peace of Abo, concluded in 1743, Russia was not only confirmed in the possession of all its conquests, but acquired some additional districts in Finland.

Since this country became subject to Russia, it has been divided into two general governments and one city; these governments are those of Riga and Reval.

The general government of Riga contains Lettonia, to which the name of Livonia is given in a more limited sense, and consists of the circle of Riga, Windin, Pernau, Dorpt, and the province of Oesel; the principal places of which are,

Riga, the capital of the whole country, seated in the fifty-sixth degree fifty-three minutes north latitude, and in the twenty-fourth degree east longitude from London, on the north-east side of the Duna; and, tho' it is not of any great extent, it is populous, well fortified, and famed for its trade and opulence. The houses are handsome, and for the most part built of stone. They are seldom above two stories high, and have steep roofs, for the better carrying off the water, which is very penetrating on the melting of the snow, wherein they have the advantage of the Russians, who have still greater occasion to provide against the like inconvenience. The cellars are used as warehouses for flax, and other goods; and the entrance or first apartment in many houses is the coach-house, through which you must pass to the parlour and dining-room. The streets are narrow. The Lutheran churches, as the cathedral, St. James's, St. Mary Magdalene's, St. Peter's, and St. John's, are handsome structures. The seminaries, called the imperial Lyceum, and the city Gymnasium, are in a flourishing condition; and the masters have very considerable salaries. Here are also an old castle, a strong citadel, and two arsenals well stored with arms, one at the charge of the crown, and the other of the city. The fortifications both on the land and water side have been improved under its present masters, and those towards the sea are enlarged by additional works. This city, by means of its excellent harbour, has, during the summer season, a good trade with England and Holland, and in winter a trade with the Russian provinces by sledges.

The Duna is generally frozen about the end of November, and open again near the middle of March; so that it has the advantage of Petersburg, where the Neva is closed about six weeks longer. When the ice breaks up, it frequently comes down in such large pieces, as to remove points of land, and form banks that sometimes remain for several years. For this reason no standing bridge can be built over the river, and there is only one of rafts and boards during the summer season.

The chief commodities here are masts, timber, flax, and hemp; great part of which is brought from the Polish Ukraine. Near five hundred ships have been annually loaded at Riga.

Its privileges, which are very considerable, were confirmed by the empress Anne. The supreme court of judicature for Livonia and the high consistory was held in this city, which is also the residence of the governor and general superintendent. This city was built in the year 1200, and soon after inclosed with a wall. It has suffered much by fires and sieges: the most remarkable of the latter are those it sustained from the Russians in 1656, the Saxons and Poles in 1700, and a second time by the Russians in 1710, when it was obliged to submit to the victorious arms of Peter the Great.

Dunnamunde is a noble fortification, about twelve miles from Riga, situated at the mouth of the Duna, where the ships which sail out of the Baltic into that river pay customs. This place was taken by the Swedes in 1609, and 1618, and by the Saxons in 1700, who gave it the name of Augustusburg. In 1701, it surrendered a third time to the Swedes, and in 1710, was taken by the Russians.

Dorpt, a town situated on a plain, watered by the river Embec, in the circle of the same name, in latitude fifty-eight degrees, was built in the year 1030, by the great duke of Russia, from whom it was taken by the religious knights in 1191; afterwards it was rebuilt, and created a bishop's see. It was formerly in a flourishing condition, being a member of the Hanseatic confederacy, and by means of its communication with Pernau, by a canal which was destroyed in the last Russian wars, carried on a considerable trade by sea. An English staple was also fixed in this town. It has undergone many remarkable sieges, particularly in 1704, when it was taken and plundered by the Russians, and the inhabitants

habitants treated with great cruelty. But its total ruin happened in 1708, when all the inhabitants were carried away by the Russians as prisoners of war, and the castle and fortifications blown up; but these captives, being afterwards permitted to return, rebuilt it with mean timber-houses.

Since the peace of Nyftadt, the number of its inhabitants have been considerably increased; many foreigners have settled there, which has rendered the town more populous than it was under the dominion of the Swedes; yet most of the buildings still lie in ruins, and the fortifications, walls, and gates, with most of the public edifices, fallen to decay, make a melancholy appearance. There are yet but fifteen private houses built of stone, and among the public buildings, none but the magazine and the German church. The present inhabitants though very numerous, are generally indigent, and its university, which was for a time removed to Pernau, is quite fallen to decay. Its trade chiefly consists in corn and flax.

Pernau is situated on a river of the same name, near the Baltic, and is a small town mostly built with timber; it has some trade, and is defended by a castle.

The province of Oesfel, includes the islands of Oesfel, Moon, and Runoe. The island of Oesfel is at the entrance of the gulph of Riga: it is eighty-four miles in length, and between sixteen and eighteen in breadth, and contains ten parishes. The soil is stony but fertile; it was formerly subject to the grand master of the Teutonic order; but without prejudice to the crown of Denmark's pretensions to it. At last the knights resigned it up to the Danes, who ceded it to the Swedes, and the latter by the treaty of Nyftadt, gave it up to Russia. It has a deputy-governor, and a college of provincial counsellors. A light-house has been erected on the island. The little island of Moon, situated near Oesfel, constitutes a parish; and the island of Runoe, which is also situated in the gulph of Riga, has a light-house erected upon it.

We now come to the general government of Revel, or Reval, which includes the province of Esthonia, or the small districts of Wyk. The principal town in this government is,

Revel, which is seated on the Baltic, in latitude fifty-nine degrees twenty-three minutes, and twenty-four degrees east longitude, though not very large, is an opulent well fortified city, that has a considerable trade. The houses are mostly of brick, and well built; but the streets are somewhat irregular. The only churches here, besides those of the Russians, are those of the Lutherans. The Germans, including the superintendant, have four ministers, which constitute the town clergy: but the cathedral, in which two bishops officiate, belongs to the nobility, who have also their chapter of nobles. There is also a Swedish congregation, and another of native Esthonians. The imperial seminary has four professors, and one teacher of the Russian language. Here is also a school for the use of the town, and another for the nobility. The tolls or customs are considerable, of which the magistracy have a part, and the rest belongs to the crown. Revel has its own arsenal, and maintains a number of matrosses, and a company of soldiers. It formerly made no inconsiderable figure among the hanse-towns. Its harbour is convenient and spacious, and has usually lying in it a part of the Russian fleet. The town is surrounded with high walls, strengthened with bastions and a deep ditch, and is likewise defended by a castle, which stands on a rock, and has several towers. The citizens have very pleasant gardens without the walls.

A quarter of a league from this city, near the sea-side, is the fine imperial garden called Catharinen-Thal.

The city of Narva is situated on the borders of Ingria, on a rising ground by the banks of the river Narva, which runs from the Lake Peipus, and discharges itself into the gulph of Finland, about twelve miles from the city. There is a high water-fall in this river, between the city and the lake; so that goods brought thither from the lake, must be taken out there and carried by land. This city stands in the latitude of fifty-nine degrees eight minutes, and in twenty-seven degrees twenty-five minutes east longitude. It is not very large, but is commodiously

situated for trade, and the houses are handsomely built with stone. In the market-place stands an elegant triumphal arch, erected in 1746, in honour of the late empress Elizabeth. Besides the Russian churches, it has a Lutheran church for the Germans, and two other churches for the natives of Finland and the Swedes. It is well fortified, and has a strong garrison. The chief commodities exported from thence are flax and timber, and a great quantity of salt is imported.

This city has frequently felt the calamities of war, when it was close pressed by the Russians in 1700, it was relieved by Charles XII. of Sweden, who, with a handful of men, defeated a hundred thousand Russians, with a very great slaughter, and raised the siege. But in 1704 it was again besieged by the Russians, and carried by assault; since which time it has been a part of the Russian dominions; but with the full enjoyment of all its rights and privileges, the Russians only reserving the right of appeal to the senate at Petersburg.

S E C T. XIV.

Of the Province of Ingria, or Petersburg & its Situation, Extent, Rivers, and principal Places; with a particular Account of Cronstadt, Petersburg, and the neighbouring Palaces; and other Places most worthy of Notice.

THE province of Ingria, called by the Russians Ingermanland, is situated between the gulph of Finland, Carelia, and Russia properly so called, and extends in length a hundred and eighty miles, and in breadth almost as much. The country is fertile, producing both corn and pasture, and abounds in all kinds of game, particularly elks.

The principal rivers of Ingria are the Luga, the Sista, the Cowassa, and the Neva. This last has its source on the lake of Ladoga, and is a broad, rapid, and navigable river. It runs throug Petersburg, where it divides itself into several branches, particularly into the Great and Little Neva, and the Newka; and, after a course of forty English miles, discharges itself into the gulph of Finland.

While the Swedes were in possession of Ingria, Lutheranism was the only religion professed in the country: but at present great numbers of the Russians, who are of the Greek church, are mixed with the old inhabitants.

In the year 1702 this province was recovered by the Russians, who had been masters of it once before, so early as the thirteenth century, but had been obliged to give it up to Sweden. It was confirmed to Russia, with their other conquests, by the treaty of Nyftadt and Abo. Ingria at present constitutes the government of Petersburg, and has the following remarkable places:

Cronstadt, a good town, and excellent fortification, is seated on the island of Retufari, which is about six miles in length, and two in breadth. This island lies in the gulph of Finland, about eight leagues by water from Petersburg, and near two leagues from the coast of Ingria. This town was built by Peter I. and is pretty large and regular in those parts that were first built; but the original plan has not been entirely executed. The streets are broad; but only some parts of them are paved. The palace of Peter the Great, which is built of stone, is now uninhabited, and, together with other handsome stone buildings, which make a grand appearance on the side next to Ingria, is falling to decay. The other buildings are but mean. Besides two principal, and several dependent Russian churches, here is a small Lutheran church; but the English congregation is no longer in being.

The wall round the town is planted with great guns, and defended by the citadel, and the fort of Cronshlofs, which is at a small distance from the town, on the Ingria side. Cronstadt has three harbours, all of which are large, safe, and commodious: that for merchantmen lies to the westward, and is very convenient; but that for ships of war, in which the greatest part of the Russian fleet is laid up, is towards the east. The powder magazine is erected in the water in this harbour. The mid-

dle harbour is for other ships and yachts belonging to the crown.

This place Peter the Great intended to fit up for repairing his large men of war, by cutting a stone canal of an extraordinary breadth and depth, with several docks in it: but this great work was not completed till the reign of the late empress. The canal alone is two wersts and fifty fathoms in length, and from the outward sluice of the dock to the sea is four hundred and seventeen English fathoms. The water in it is raised to the depth of twenty-four feet, by means of the two large sluices. The canal, when full, is a hundred feet on the surface of the water, and at the bottom from fifty-four to sixty-seven in breadth: the outward and inward walls of the canal, and the mole, are hewn out of the solid rock. At the end of the canal is a deep basin lined with stone, which intersects the former at right angles, and is designed for a reservoir for the water of the canal, when the docks are to be cleared of it. At the first opening of the canal in the year 1752, it received the name of Peter the First and the Great; and at its mouth were erected two pyramids. This great and useful work has not its equal in any part of the known world.

The castle of Cronshlofs, just mentioned, is built on a sand-bank in the sea, at the distance of a cannon-shot from the harbour of Cronstadt, towards Ingria, and was erected by Peter I. for the defence of his conquests; and such improvements have been since added, that, like Cronstadt, it may justly be esteemed the bulwark of Petersburg. It is erected in the form of a round tower, with three galleries one above another, and is well provided with cannon on every side. All the ships that sail to Petersburg are obliged to pass between this castle and Cronstadt, within reach of the cannon on both sides.

Directly opposite to Cronstadt, near the gulph of Finland, is the fine palace of Oranienbaum, built by prince Menzshikow; and nothing can be more delightful than the garden adjoining to this seat.

Peterhoff is an imperial seat on the coast of Ingria, where the late empress usually spent the summer season. From the time of Peter the Great no expence has been spared in adding to the fine situation of this palace all the embellishments of art. The house indeed is far from being regular; but whoever views the elegance of the gardens, which are adorned with fountains that throw up vast columns of water to an extraordinary height, with the grottos, double cascades, pleasant groves, and many other ornaments, will not think them much inferior to those of Versailles, which they excel in the sweetness of the water. The palace stands on a hill about sixty feet high, and on one side has a most extensive prospect, diversified with noble objects, as the city of Petersburg, Cronstadt, and the gulph of Finland. Among the summer-houses belonging to this palace is one distinguished by the name of *Mon Plaisir*, or *My Delight*, and is particularly remarkable for its curious paintings.

At no great distance is Strelenhoff, or Strelna-Musa, an imperial palace built in the water, erected by Peter the Great, who employed many thousand men in this work; for he intended to make it a superb palace, and to form a garden with a labyrinth and other embellishments; but his plan has never been completed.

Catharinehoff, Annenhoff, and Elizabethhoff are imperial palaces, or pleasure-houses, on the river Neva. The former was the favourite residence of the empress Catharine, and properly consists of two edifices. It stands in a wood, on one side of the finest spots in the neighbourhood of Petersburg; but, from its low situation, is exposed to frequent inundations.

We shall now give a particular description of Petersburg, one of the capitals of the Russian empire. The beginning and increase of this great city were very extraordinary; for, till the year 1703, the only buildings on the spot where it stands were two small fishing-huts. But Peter the Great having in that year taken the town of Nyen-shanze, seated on the Neva, and made himself master of this country, its commodious situation for the Baltic trade induced him to build a town and fortress here, and he immediately began to put his project in execution.

It was indeed first designed only for a place of arms, to which all kinds of military stores might be conveniently brought from the interior parts of the empire, by which means the war with Sweden might be carried on with more vigour and dispatch. Hence the public edifices and private houses were built only with timber, and neither the dock nor the town had any other fortifications than a mean rampart of earth, nor were the streets paved. But the victory at Pultowa, and the conquest of Livonia, inspired Peter with the hopes of being able to preserve his conquest, and to render Petersburg the capital of his empire. His fondness for maritime affairs, a desire of perpetuating his name by having it called by that of St. Peter, and his aversion to Moscow, where, in his younger years, he had received much ill treatment, were the chief motives that induced him to lay the foundation of a new city that was to become the capital of his dominions.

Peter had no sooner formed this design, than he ordered the castle to be built of stone, the admiralty to be walled in with the same materials, and all the buildings to be erected in a more handsome and durable manner.

In 1714 he removed the council to Petersburg, and noble edifices were erected in a straight line for the public offices, which, in 1718, were also removed thither. The principal families of Russia were likewise ordered to reside there, and build houses according to their abilities. But this occasioned some irregularity in the buildings; for the nobility and burghers had been directed to build their houses on the island of Petersburg, and many public and private structures were accordingly erected there; but, in 1721, the emperor determined that the whole town should stand on the island of Wafili. The streets were marked out, canals were dug, the island was fortified with fifty-seven bastions, and the nobility were to begin their houses a second time: but the death of the emperor put a stop to the execution of his plan; and the stone buildings that had been erected went to ruin.

The Russian nobility were naturally averse to settle in Petersburg, as they could neither live there so cheap, nor so commodiously as at Moscow. The country about Petersburg is not very fertile, so that provisions are brought thither from a great distance, and must be paid for in ready money; which was no small grievance to the nobility, who chiefly subsisted on the produce of their estates; but seldom abounded in cash. Besides, Moscow seemed much fitter for being the imperial seat, as it is in the center of the empire, from whence justice might be more easily administered, and the national revenue be received and disbursed with more convenience and dispatch. Besides, Petersburg seemed to them to lie too near the frontiers of Sweden. However, this city in the time of Peter I. became large and splendid, and under his successors received additional improvements, so that it is now ranked among the largest and most elegant cities in Europe.

Petersburgh is partly seated on the continent of Ingria and Finland, among thick woods, and partly on several small islands formed by the branches of the Neva, in the fifty-ninth degree fifty-seven minutes north latitude, and in the thirty-first degree of east longitude from London. The low and marshy soil on which it stands has been considerably raised with trunks of trees, earth, and stone. However, its situation is pleasant, and the air salubrious. The city is about six English miles in length, and as many in breadth, and has neither a wall nor gates.

The river Neva is about eight hundred paces broad near Petersburg; but has not every where a proportionable depth of water, so that large merchant ships are cleared at Cronstadt, and the men of war built at Petersburg are also conveyed thither by means of certain machines called camels. Besides the Neva, the rivers Fontanca and Moica contribute to form the islands on which the city stands, which is also watered by several canals; for in this respect Peter took his model from Amsterdam. There is but one bridge over the Neva, which is constructed with large flat-bottomed boats, and joins the dock-yard to Basili Ostrow, or Basil's Island. These are laid across the river in spring, so as to form a safe and convenient passage; but they are always removed in autumn, before the frost begins. The only communication

cation between the other islands is either by boats or barks, which cross the water at stated times; but bridges are built over the Moica and Fontanca, and likewise over the canals.

The number of houses at Petersburg are computed at eight thousand, about six hundred of which are of stone; but the rest are built with timber, and for the most part in an irregular manner, after the Russian taste. There are about twenty Russian churches in the city, besides four Lutheran churches for the Germans, and several Calvinistical for the Swedes, Fins, Germans, and French protestants; and likewise other places of worship for the English, Dutch, and Roman catholics. In giving a more particular description of this city, we shall begin with Petersburg Island, including the small island on which the fort, which is in the middle of the Neva, and also of the city, stands.

Petersburgh Island is formed by the Great and Little Neva and the Newka. The above fort is of an hexagonal form, and built of stone, according to the modern improvements in fortification. It is planted with a great number of cannon, and additional works are continually made to it, which are all vaulted. In the middle of it stands an elegant church, where the remains of Peter the Great, his consort Catharine, and several other persons of the royal family, are deposited in magnificent mausoleums. In the high beautiful tower belonging to this church, which is covered with gilt copper, hangs a fine set of bells, with chimes, made in Holland, that always play at twelve o'clock. On one of the bastions of the fort facing the imperial palace is always hung out a flag, which on state holydays is exchanged for a finer that bears the Russian eagle. As this fort stands in the center of the city, it is not only a defence but a very great ornament to it. It also serves for a secure prison, and on any exigency might prove a convenient asylum to the sovereign. On state holydays the bastions and curtains of this fort are finely illuminated with lamps.

On the island of Petersburg, properly so called, is a horn-work that belongs to the castle. This island is above two leagues in circumference, and is extremely well peopled; but most of the houses are mean buildings, and the five Russian churches, the shambles, inns, and corn-market, have nothing worth notice. There is still to be seen on this island the small wooden house which Peter the Great ordered to be built, and lived in, the first time he arrived on the spot on which this city stands; and, that it may remain as a lasting monument of that circumstance, it is kept in repair, and inclosed with a stone-wall.

From the island of Petersburg you cross the Little Neva, and come to the island of Wafili, or Basil's Island, which is the largest of them all. It lies towards Cronstadt, and is surrounded by the Great and Little Neva. The greatest part of it is covered with woods, and the rest with buildings, it having twelve broad streets of an uncommon length, running in a direct line, and intersected at right angles by six cross streets; but they are not paved. The vistas from these street are very broad and beautiful at both extremities, the largest extending the whole length of the island as far as the Galley Harbour. Opposite to Petersburg Island, and adjoining to the hemp-warehouse, are the exchange, the custom-house, the pack-house, and the quay, where the merchant ships unload. Contiguous to these are several large stone buildings belonging to the imperial academy of sciences, founded in 1724 by Peter the Great, and endowed with an annual revenue of twenty-four thousand nine hundred and twelve rubles. That monarch also intended to erect an academy of polite arts; but as estimates of the necessary charges of such an institution were not made, the late empress Elizabeth increased the above endowment to fifty-three thousand two hundred and ninety-eight rubles.

The academy is divided into two classes, the first constituting the academy properly so called, and the second the university. The members of the former are employed only in finding out new inventions, or improving the discoveries of others, and are under no obligation to instruct youth, unless particular pupils are recommended to

them, or they do it voluntarily for their own advantage. The university has its particular professors, who read lectures in the sciences, both in the Latin and Russian languages. Difference of religion does not disqualify a person from being a professor; but they are enjoined not to inculcate to their pupils any thing contrary to the doctrines of the Greek church. In the buildings which belong to the academy are the imperial library; a museum, containing natural and artificial curiosities; the printing-house; the bookseller's-shop; and apartments for binding, letter-founding, painting, engraving, and the room where mathematical instruments are made. Among these last curiosities is the famous copper globe of Gottorp, which stood on a tower of the academy, and was almost destroyed by fire when that tower was burnt in 1747; but has been repaired at a great expence, and with admirable skill: you ascend a few steps, and enter into the globe through a small door: within stands a table with benches round it, on which twelve persons may conveniently sit. The inside contains the celestial globe, and the outside the terrestrial; its diameter is eleven feet, and it at present stands in a stone edifice by itself.

The next remarkable place is the fire-work theatre, built on piles opposite to the imperial winter palace. Here is a very long stone building appropriated for the state colleges and offices. Just behind these stands a spacious and elegant structure, formerly prince Menshikow's palace, but now the academy of the corps of cadets of noble families, who are educated gratis, according to their rank. Near this academy is another for three hundred and sixty sea cadets.

The Admiralty Island is the most magnificent part of the city: here is the victualling-office; the galley dock, in which all the gallies are built; and vast store-houses for ship-building. Here are likewise a great number of handsome stone houses and elegant palaces extending along the river side. The English factory have their place of worship in this part, and behind it is New Holland, with the Rope-walk. The admiralty, or dock-yard, is fortified with a wall and five bastions, planted with many guns; and all ships that enter the harbour salute it. The top of the tower belonging to the admiralty is gilt, in the same manner as that of the great church in the castle.

The imperial winter-palace, near this place, is a large square building three stories high; but the architecture is not extraordinary. Behind it, in a spacious area, stands a noble equestrian statue of brass gilt, erected in honour of Peter the Great. Adjoining to this, along the banks of the Neva, are several other palaces, among which is the old imperial winter palace; several elegant stone buildings; the new play-house, which is built of timber; and a delightful imperial summer palace, which is all of wood, and, being only one story high, resembles a pleasure-house. Behind it are several stone buildings for the officers belonging to the court. It has a fine orangery, and a large beautiful garden, most admirably adorned with a grotto, fountains, and other water-works, with a great number of valuable marble and alabaster statues brought from Italy; but all of them are not executed with equal skill. Two of these statues which stand near the grotto, representing Faith and Religion, are greatly admired by the connoisseurs for the appearance of the faces through thin transparent veils, which seem to cover them. This garden is famous for a fine grove of oaks, that has not its equal in all the Russian empire. The dock affords a double vista, one to the Russian church of the Ascension, the other terminated by the convent of Alexander Newski. The elegant buildings on both sides the river Fontanca have also a beautiful appearance from hence.

The streets that lie behind the admiralty, and behind the imperial summer palace, are very grand and magnificent; but those are equalled, if not excelled, by Great and Little Million-street, which are embellished with the most superb buildings. At the end of Million-street, near the garden of the summer palace, the emperor has a curious dispensary. In this part also lie the imperial stables, and the dwellings of the officers who belong to them; the church of the Swedish Fins; the German Lutheran church, dedicated to St. Peter, which is an elegant

elegant structure; the menagery; the park; and the elephant-yard, where several of those animals are kept.

The Moscovite side, which is properly the city, is on the continent, and part of it very well built. In this quarter are the private dock; the court victualling-office; a foundery on the Neva, in which are cast a great number of mortars and cannon; the fire-work elaboratory; the aqueduct, which supplies the fountains in the emperor's garden; the German Lutheran church, dedicated to St. Anne; three Russian churches; the barracks for the horse-guards, with the stables for their horses; a structure called the Pleasant-house; the Italian garden; the Moscovite *Iemskoi*; and the convent of St. Alexander Newski, built in honour of that pious prince, in the form of an eagle, but not yet completed: it contains about two hundred apartments. In the middle of the building stands a very large and beautiful church, which represents the eagle's body, the two towers its neck and head, the spire the imperial crown, and two small churches on each side the two wings. In this convent are said to be deposited the remains of that saint; for which the empress Elizabeth caused a silver shrine to be made, which is fixed on a superb monument covered with silver plates of a considerable thickness.

Jonas Hanway, Esq; observes, that, with respect to the modern palaces and other buildings, an Italian architect having settled in Russia, notwithstanding the difference of climate, the taste of Italy is adopted; and though the severity of the cold is so great in winter, they abound much more in windows than our houses.

There is a great variety of curious manufactures in this city, as that of looking-glasses, gold and silver works, tapestry, &c. Its extensive commerce also renders Petersburg of great importance; for a multitude of ships from all the maritime countries in Europe frequent this port, as the mart for buying all Russian commodities; and find a vent for all the goods they import, and for which there is a demand in Russia.

The inhabitants of Petersburg, besides Russians, consist of all nations; so that a person hears a variety of languages, and sees a surprising diversity of fashions and customs. The citizens, properly so called, do not exceed two hundred; but the city contains above a hundred thousand persons, or according to some authors, two hundred and fifty thousand, including the garrison. The inhabitants in general imitate the splendor of the court, though every thing belonging to dress, especially if made by foreign artificers, is very dear; as is also furniture; and houses in a good situation sometimes bear a very high price. On the other hand, all kinds of provisions, except wine, oranges, lemons, and some other foreign articles, are now sold very cheap, and in winter are brought in great abundance from the distance of many hundred miles.

The morals of the people, as in all large cities, are much depraved, and the suspicious vigilance of the Russian government renders it necessary for a stranger to be very circumspect in his words and behaviour. Foreigners, however, enjoy all possible liberty of conscience, while they take care to say nothing against the Greek religion.

When a person intends to set out from the city, in order to travel into the country, he must be furnished with a pass, and advertise his name and intention of travelling in the news-papers. No sooner is the winter set in, than near three thousand Russians repair with their sledges to Petersburg, where they stand in every street; and this method of carriage is so cheap and convenient, that few go on foot even about the town. A sledge and a horse may be hired for the value of about five-pence sterling an hour, and within that time the horse will go about seven or eight English miles. It is sufficient for a stranger to know the place or house to which he would go, and to understand three or four Russian words. Most house-keepers have their own sledges and horses, and persons of distinction have also their postilions. In summer time those who are not inclined to go on foot in this extensive city, must either make use of their own carriage or hire boats.

About thirty wersts from Petersburg is Sarfkoe-Selo, a pleasant imperial palace, with a park and garden. In

the hermitage is a table which may be raised up by screws into the apartment above, and let down again at pleasure.

Besides the fortifications already mentioned in this province, there is the strong fort of Schlusselfburg, which stands on a small island in the midst of the Neva, where it runs out of the lake of Ladoga. It was formerly called Oreshec, from the form of the island, which resembles a nut; but Peter the Great having made himself master of it in 1702, changed its name to Schlusselfburg, or Key-town, that monarch esteeming it the key of his conquest. Its walls are two fathoms and a half thick, and built in the old manner; and in one angle of the fort is a small strong castle. The Russians have improved this fort both within and without, and added new works to it; it has undergone many sieges, and when Peter I. took it in 1702, he ordered two medals to be struck in commemoration of his success.

SECT. XV.

Of the late Acquisitions in Carelia, or the Government of Wiburg; with a concise Account of the principal Places it contains.

WITHIN this province is included part of the great dutchy of Finland, which the Swedes ceded to Russia, and contains three districts, Finlandish, Carelia, Kexholm, and Sawolax.

Carelia has frequently proved a bone of contention between Russia and Sweden. In 1293 it fell under the Swedish dominion, but in 1338 part of it was yielded up to Russia. By the peace of Nyfadt, concluded in 1721, a still greater part was resigned to the Russians, the western part alone being left in the possession of the Swedes. Afterwards Sweden was obliged to give up, by the treaty of Abo, the fort of Fredericsham and Wilmanstrand, with part of the parish of Pythis, situated on the other side of the eastern branch of the river Kymmene. In this part of Carelia are the following places:

Sufterbec, which is seated in the gulph of Finland, is remarkable for the excellence of its muskets, swords, and iron utensils. The greatest part of the arms used by the Russian troops are made in this place.

Wiburg, once the capital of Carelia, a bishop's see, and the bulwark of Sweden against Russia, is situated on the gulph of Finland, and carries on a considerable trade. Peter the Great having taken this town by capitulation, in the year 1710, improved its fortifications, which have ever since been kept in such good condition, that Wiburg may now be considered as the bulwark of Russia against Sweden.

Wilmanstrand is seated on the lake Saima, and is called by the Finlanders Lappi Wessi, or Lapp Water. It had formerly the name of Lapstrand, and was only a market-place, but was afterwards made a town; yet it has no magistrate of its own, it being dependent on Fredericsham. It was a considerable mart for tar, and the residence of a Swedish governor. On the twenty-third of August, 1741, an obstinate battle was fought about an English mile from this town between three thousand Swedes and sixteen thousand Russians; but the former were at last obliged to yield to superiority of numbers. The Russians, after they had gained the victory, burnt Wilmanstrand, which was before fortified with a wall and moat; but they have since caused it to be rebuilt.

Fredericsham is situated on the gulph of Finland. This town was governed by two burgomasters, and was defended by a castle built in 1722: it had also a good harbour and a considerable trade in tar; but in the last war between the Russians and Swedes it was burnt to the ground, and ceded to the latter; afterwards it was rebuilt, and the limits between Sweden and Russian Carelia were fixed near this place.

The district of Kexholm has been frequently contended for by the Russians and Swedes, and was restored to the former by the treaty of Nyfadt. The most remarkable place in it is,

Kexholm,

Kexholm, a strong town situated on two small islands at the influx of the river Woxen into the lake of Ladoga. The town is built on one of these islands; but the houses are all of wood; and on the other island stands the castle.

In that small district, which is a part of Sawolax that was yielded up to Russia by the treaty of Abo in 1743, is only the town of Nyflot, and the country nine miles round it.

This town is situated on the Samian lake, and was built so lately as in the year 1745; its castle, which stands on a rock in a river near the town, is extremely well fortified both by art and nature. In the year 1495 it baffled the attempts of Russia, but in 1714 was obliged to submit to their arms. It was restored to the Swedes at the peace of Nyftadt, but they were constrained to give it up to the Russians by the treaty of Abo.

C H A P. III.

OF POLAND, LITHUANIA, POLISH PRUSSIA, and COURLAND.

S E C T. I.

Of POLAND in general.

Its Name, Situation, Extent, Climate, Soil, mineral and vegetable Productions; Animals, Lakes, and Rivers.

THE limited Kingdom, or, as it is also termed, the Republic of Poland, is called by the natives Polska. These names are deduced from the word Pole, or Poln, which in the Slavonic tongue signifies a country adapted to hunting, the whole kingdom being composed of vast plains, and antiently of forests that afforded shelter for an infinite number of wild beasts.

In its largest extent it is bounded on the east by Russia and Little Tartary; on the south by Moldavia, Transylvania, and Hungary; on the west by Silesia, Brandenburg, and Pomerania; and on the north by Russia, Livonia, Courland, and the Baltic; extending from forty-seven degrees forty minutes to fifty-six degrees thirty minutes north latitude, and between sixteen and thirty-four degrees east longitude from London.

The air is pretty cold in winter, but very healthy; and the country is for the most part level, it having but few hills. On the Carpathian mountains, which separate Poland from Hungary, the air is so very cold, that it frequently snows there in the midst of summer; and in some parts of them the snow never melts.

The soil is exceeding fertile, and yields plenty of corn, which evidently appears from there being near four thousand vessels and floats, most of them laden with corn, that annually pass down the Vistula to Dantzic. In Podolia, Volhinia, the Ukraine, and the province of Russia, corn grows in vast plenty, even with little culture or manure; but in Great and Little Poland agriculture requires more labour and attention: however, the harvest amply rewards the pains of the industrious peasant. The soil of Lithuania is as fruitful as that of Podolia, and Samogitia produces abundance of grain, besides flax and hemp. Polish Prussia is likewise a very fertile country, that also abounds in excellent pastures; and in Podolia the grass grows so high, that sometimes a person cannot see the horns of the cattle when they are grazing in the meadows.

In this country are found peat, oker of all kinds, beryllites, agate, chalcedony, cornelians, onyxes, opals, jasper, fine rock-crystal, amethysts, topazes, sapphires, and even rubies. This country likewise affords marien-glass, or moscovy-glass, talc, allum, salt-petre, amber, pit-coal, and an inexhaustible quantity of salt, which is hewn out of the rock in large blocks; salt springs, spar, quicksilver, lapis calaminaris, iron, lead, and a small quantity of tin.

With respect to the vegetable productions of this country, they have fruit, herbs, roots, and other garden-stuff in great plenty; but though their grapes are well tasted, they will not make wine.

Polish manna is produced by an herb that grows in the meadows and fenny grounds, and is gathered in great quantities from the twentieth of June to the end of July.

The Polish berries called kermes, are always gathered in May, before they are quite ripe; for in the month of July they swarm with insects, which render the berries unfit either for dying or medicine. These berries are found on an ever-green of the oak kind, adhering to its leaves; but generally to its stem or branches. They are of a spherical form, as large as a pea, smooth, shining, and full of a mucilaginous juice of a beautiful red colour. After the most diligent enquiries of naturalists into the production of this grain, it is found to be the nest of a small fly or worm, which pricking the bark or leaf, in order to deposit its eggs, raises a little tumour, which by degrees fills with a red pulp, impregnated with the numerous progeny of that animalcula. Great quantities of these berries grow in the Ukraine, and in the neighbourhood of Warsaw and Cracow, and were formerly exported to Genoa and Florence. Here are several woods of oak, beech, pine, and fir trees. Poland also yields abundance of honey and wax, and of the former is made a great quantity of mead.

Horned cattle are bred in such numbers, that eighty or ninety thousand oxen are every year driven out of Poland. The Polish horses are strong, swift, and beautiful, and of these they have also great numbers. Among the wild beasts are the elk, the bison, which resembles the buffaloe; and also deer, hares, wolves, foxes, bears, and wild asses; and in the Ukraine, near the Nieper, are wild sheep and wild horses.

In great Poland are several lakes, some of which abound in fish: the most remarkable of these is the lake of Gopler, which is near twenty miles in length, and two miles and a half in breadth.

Among the Polish rivers the following are the most remarkable.

The Duna, called by the Poles the Cubo, which has its source in Russia, and after running through Lithuania, discharges itself into the Baltic.

The Memel, in Polish Niemen, which rises in the palatinate of Novogrodec, and running through Lithuania and Prussia, enters the Baltic.

The Weisel or Vistula, in Polish the Wisla, rises among the Carpathian mountains, runs through Poland, and after receiving several other streams, discharges itself into the Baltic.

The Niester, which rises in a lake among the Carpathian mountains, and dividing Poland from Moldavia, falls into the Black Sea.

The Nieper, the ancient Borysthenes, which rises in the mountains of Budin, in Russia, and after a course of near a thousand miles, discharges itself into the Black Sea.

S E C T. II.

Of the Persons, Dress, Manners, and Customs of the Poles. Their Houses, Food, Diversions, Method of Travelling; Language and Skill in the Sciences.

THE Poles are generally pretty tall, and inclinable to be fat; they have fair complexions, and their hair is usually of a pale yellow; they have good constitutions,

tutions, and have a healthful look. They cut the hair of their heads short, and shave their beards, leaving only large whiskers: in short, they have a stately mien, and great gravity of countenance.

The dress of the Poles is pretty singular: they wear a vest which reaches down to the middle of the leg, and a kind of gown over it, lined with furs, and girded with a sash; but the sleeves fit as close to their arms as a waistcoat. They wear a fur cap, but have neither stock nor neckcloth; for though they wear a shirt, it is almost like a woman's shift, without a collar or wristbands. Their breeches are wide, and make but one piece with their stockings. Instead of shoes they always wear Turkey leather boots, both abroad and at home, with thin soles, and deep iron heels bent like an half moon. They carry a pole-ax, and a sabre or cutlass, by their sides, which they never put off but when they go to bed. The sabre hangs by a leathern strap, with their handkerchief, knife and sheath, and a small stone set in silver, to whet their knife on. When they appear on horseback, as they frequently do, they wear over all a short cloak, which is commonly covered with furs, both within and without. The people of the best quality wear fables, and others the skins of tygers, leopards, &c. The peasants usually wear a sheep-skin with the wool on, for their winter dress; but in summer, a thick coarse cloth, and instead of boots, wear buskins and shoes made of the bark of trees; but as to linnen, they wear none at all.

The habit of the women comes very near to that of the men, only people of quality affect the French mode of dress. The Polish ladies are amiable, witty, and sprightly, and are passionately fond of plays and music. They are generally modest, and according to Dr. Conner, so submissive to their husbands, as to ask them on the knee for what they want, and dispose of no money without their consent. Those who are very rich, seldom go to church, or to pay a visit, without their coach and six, a great number of servants, and particularly an old gentleman for their usher, and an old gentlewoman for their governante, with a dwarf of both sexes to bear up their train; and if it be night, their coach is surrounded by a great number of flambeaux.

These people have long been celebrated for their courage, their strength, and their longevity; no country in the world affording more extraordinary proofs of bodily vigour, and an uninterrupted flow of health, which are justly ascribed to the temperature of the climate, their inuring themselves to manly exercises, and the continual use of the cold bath, even in the coldest parts of Poland: this last is supposed to contribute greatly to that muscular strength for which they are remarkable.

The nobility are open, affable, liberal, and hospitable, polite to strangers, rigid to their dependents, punctilious in point of honour, vain, ostentatious, and magnificent in their apparel, equipage, and manner of living: for some of the wealthy will have forty suits of cloaths as rich as possible. Though the Poles are passionately fond of liberty, they live in a perpetual state of servitude to their profusion and necessities, which frequently make them stoop to be the tools of some political faction. The constitution of Poland has been the source of continual misfortunes, yet the nobility are attached to it to a degree of enthusiasm, and especially to those parts of it which produce the greatest inconveniences. Poor in the midst of a fertile country, they abhor the notion of improving their circumstances by trade, and are, perhaps, the only people upon earth who have provided by law against raising a maritime power. Prodigality and debauchery are said not to be reputed vices among this martial nobility: they borrow without intention of paying, with the same freedom that they squander. Constant in their friendships, bitter in their enmity, open to imposition, unsuspicious, opinionated, and haughty, their only care is to distinguish themselves in arms, in finery, equipage, and splendor.

As to the vulgar, they are mean, mercenary, ignorant, indolent, and indigent to an extreme. This is the character given by several authors of the Poles in general, as the distinguishing features of that people; but it is not to be doubted, that there are many exceptions to whom this character would be highly unjust, and

who are distinguished by their learning, their good sense, and their humanity.

The Polish houses chiefly consist of ground rooms; for they seldom live above stairs. The dwelling house is usually opposite the gate, the kitchens and offices on one side a round, or square court, and their stables on the other; they are generally of wood; but those who affect the Italian architecture, build much higher with brick or stone. Every nobleman has a hall or large room set apart for entertainments, in which is a place railed in with ballusters, in which the plate is placed, and over it a gallery for the music. The rooms are usually hung with tapestry, and the rest of the furniture is proportionably rich, except where they are liable to the incursions of the Tartars, and there they have as little furniture as possible. The Polish nobility have seldom any gardens or orchards to their houses, though the soil is extremely proper for them. But there are bagnios and stoves in every house, and the women have them separate from the men. There are also baths in every town for the use of the common people, who bathe every day.

The houses of the peasants consist only of huts built with poles in a round form, and open on the top, to let out the smoke. They are covered with thatch, or with boards; and as they frequently consist but of one room, the people and their cattle sleep together.

To the character that has already been given of the love of splendor which prevails among the Polish nobility, it is proper to add, that those of high rank and great estates have their horse and foot guards, which stand centry day and night at the gates of their houses, and in their anti-chambers, and that they march before their master's coaches in the street. But these nobles never appear with such splendor, as when they are at the general diet, where they will have four or five hundred, and some a thousand guards to attend them; for they esteem themselves not only equal but superior to any of the German princes: and indeed, they want little to distinguish them from sovereigns in their respective districts, but the privilege of coining money.

When they sit down to dinner, or supper, they have their trumpets and other music playing, and a great number of gentlemen to wait on them at table, some to carve, others to serve their wine and place the dishes, all serving with the most profound respect; for though the nobility of Poland are all said to be equal, as having votes in the diet, yet wealth will ever create a distinction, and the nobles who are poor frequently find themselves under the necessity of serving them that are rich. Their patron indeed usually treats them with civility, and permits the eldest to eat with him at his table with his cap off, and every one of them has his peasant-boy to wait on him, maintained by the master of the family. Yet if any of these noble servants neglects his duty, so little regard is paid to his quality, that he is stripped naked and whipped, and this is reckoned no disgrace; but if a nobleman should apply himself to trade, he would be deemed infamous.

Their ordinary food is beef or veal, mutton being little esteemed; but they have plenty of wild-fowl and river-fish. Though they have such plenty of corn, they eat but little bread, preferring roots to it, which they dress different ways. They are not fond of soup and broth, nor do they roast their meat too much: they are general admirers of pig and bacon; pease are also esteemed a genteel dish by the great. In their sauces they use a great quantity of saffron and spices; for they season their dishes high: they are also fond of mushrooms and pickled cabbage.

At an entertainment the Poles lay neither knives, forks, nor spoons, but every person brings them with him; and they no sooner sit down to table than all the doors are shut, and not opened till the company return home. Those who are invited, bring their servants with them; and it is said to be no uncommon thing for a nobleman to give his servant part of his meat, which he eats as he stands behind him, and to let him drink out of the same cup with himself; but this is the less extraordinary, if it be considered, that these servants are esteemed his equal. Though there are usually great plenty of provisions,

provisions, very little is left for the rest of the family, it being seized by the servants of the visitors, who have a napkin in order to carry off the sweetmeats for their ladies. After the cloth is taken away the gentlemen usually sit down to drinking, and after the ladies are retired, smoke tobacco; for the other sex are not excluded from their feasts. Bumpers are much in fashion, both here and in Russia; nor will they easily excuse any person from pledging them.

Their usual drink is beer, which in Polish Prussia they make only of malt; but in other parts of Poland of wheat ground. In Lithuania, and several other provinces of Poland, they have mead and metheglin; and at Warsaw they frequently mix the juice of cherries, blackberries, &c. with their honey, upon which the liquor receives different names. But besides beer and mead produced in the country, great quantities of wine are imported from Hungary, France, Spain, Italy, and Germany. That of Hungary is said to exceed the Spanish in strength, and is brought over the Carpathian mountains in large casks drawn upon carriages by oxen, which makes it very dear, the best sort being sold for twenty shillings the Polish pot, which is three quarts. The Italian wines come also over land; but are not much drank. The French and Rhenish wines come by the way of the Baltic to Dantzic. Their strong waters and spirits are drawn from wheat, barley, oats, and cyder; but these are chiefly drank by the common people, though sometimes the nobility will drink them in winter, when impregnated with anniseeds, cinnamon, and other spices.

The people are in general so extremely hardy, that the boys slide naked on the ice: the Poles will sleep upon the ground without a bed in frost and snow, and carry about their young infants naked in the severest weather. Hunting and feats of horsemanship are the diversions of the great; and leaping, vaulting, and dancing, are also favourite diversions.

The usual method of travelling is on horseback; for a Polish nobleman will scarce walk a stone's throw in a town without his horse; but as it is a champaign country, a calash and a pair of horses are very much used on a journey.

There are very few inns upon the roads, and in those a traveller meets with he can seldom find any thing to eat; hence he is obliged to buy provisions in the towns, and carry them with his baggage. This inconvenience is said to be owing to a want of honesty in the natives when they travel; and the inn-keepers never make any extraordinary provision, from their finding by experience that their guests are seldom disposed to make any returns for their entertainment.

The Polish language is derived from the old Slavonic; yet differs extremely from all the other languages derived from the same source.

High Dutch is very much spoke in Poland; and indeed the Germans first introduced into Poland a taste for learning, opened the channels of commerce, built several towns, and raised them to a flourishing condition: for Casimir the Great, sensible of the advantages Poland might reap from German colonies, invited them to settle in this kingdom by the greatest encouragements, granting them the most improveable spots in Poland, and permitting them to be governed by their own laws.

The Latin tongue is likewise commonly spoken in Poland, even by the lower class of people; but without the least regard to accent, quantity, or purity of language.

Dr. Busching observes, that from the time of king Sigismund I. to the reign of Uladislav IV. was the interval when arts and sciences flourished most in Poland. Since that æra the Polish muses seem to have drooped and languished: however, they now begin to revive; for at present the purity and elegance of the Polish and Latin tongues are studied, the new philosophy is introduced, the mathematics are taught, and natural philosophy flourishes in Poland. The learned in this country also apply themselves to the study of the history of Poland, which they cultivate and improve, and endeavour to make the good writers of former ages better known, and use of to the present; and for this purpose the library of

count Zalufki, at Warsaw, opens an inexhaustible treasure of antient authors.

The Greek language also begins to be studied in Poland, and literary correspondences are carried on with learned foreigners; but the press has not yet produced so many books as in other countries.

Poland exports none of its manufactures, its commodities being carried out of the country unwrought. Dr. Busching observes, that religious bigotry is of infinite detriment to the trade and commerce of Poland, which, notwithstanding all its natural advantages, has been long gradually sinking into poverty. The Poles, indeed, export grain of all kinds, masts, deal-boards, ship and house timber, pitch, flax, hemp, linseed, hops, honey, wax, hides, horned cattle, tallow, leather dressed in the Russian manner, pot-ash, horses, and other home commodities: but these are much over-balanced by the imports, as wine, that of Hungary alone, annually carrying vast sums out of the kingdom; the other articles of commerce imported are spices, plate, copper, brass, and steel.

S E C T. III.

Of the different Classes of the People; the Privileges of the Nobles, and the Slavery of the Peasants; with a concise Account of the Nature of the Wealth of the Poles.

THE Poles, when considered as members of the community, are either nobles or citizens, under which class are included merchants, artists, and mechanics; or peasants, who are mostly vassals to the nobles.

The Polish nobility have from time immemorial resided in the country; for every nobleman lives in his own village, seat, or castle; manages his estate by his vassals, or hired servants; and maintains himself and family by agriculture, breeding of bees, grazing, and hunting. Some of the nobility also spend part of their time in cities and towns.

Though Poland has its princes, counts, and barons, yet the whole body of the nobility are naturally on a level, except the difference that arises from the posts some of them enjoy. Hence all who are of noble birth call one another brothers. They enjoy many considerable privileges, and, indeed, the boasted Polish liberty is properly limited to them alone; for they have the power of life and death over their vassals, who on that account groan under an oppressive slavery. Besides, every nobleman is absolute lord of his estates; so that the king can require no subsidy from him, nor is he obliged to maintain or find quarter for any soldiers. If a foreigner dies on a nobleman's estate in Poland, without leaving any heirs, his effects fall to the lord of the manor; but on the decease of a nobleman without heirs, his estate does not fall to the king, while there are any persons living who are related in the eighth degree to the deceased; and if a nobleman dies without heirs, or any such relations, the king can appropriate his estate to himself; but is obliged to bestow it on some other nobleman of merit.

The house of a nobleman is a secure asylum for persons who have committed any crime; for none must presume to take them from thence by force; and even the judges in the towns dare not cause a nobleman's vassal to be arrested, or his effects to be seized; nor can any magistrate, not even the king himself, cause a nobleman to be arrested, without signifying the crime of which he is accused, and giving a previous citation, except he be a robber, and has been three times impeached by his associates, or be surprized in the commission of a crime; or lastly, when he cannot or will not put in bail.

All ecclesiastical dignities and civil posts are to be held only by the nobility, and they alone are qualified to be proprietors of estates, except the burghers of the cities of Thorn, Cracow, Vilna, Lemberg, and Lublin, who have the privilege of purchasing lands. Any nobleman may purchase a house and live in a city or town, but he must then submit to serve municipal offices; and if he be concerned in trade or commerce, he forfeits the privileges of a noble Pole. Every nobleman has not only a vote in the election of a king, but is even qualified to wear

the crown, if he be raised to it by the free choice of the rest of the nobility. All civil causes relating to the nobility are tried in the provincial courts of judicature; but if a nobleman commences a suit with the farmers of the royal domains, a commissarial court is appointed to terminate the dispute.

Nothing can be more abject than the peasants of Poland. If one lord kills the peasant of another, he is not capitally convicted, but only obliged to make reparation, by another peasant equal in value. The peasants have no property, and all their acquisitions serve only to enrich the master. They are indispensably obliged to cultivate the earth; they are incapable of entering upon any condition of life that might procure them freedom, without the permission of their lords; and they are exposed to the dismal and frequently fatal effects of the caprice, cruelty, and barbarity of their tyrannical masters, who oppress them with impunity, and having the power of life and property in their hands, too often abuse it in the most gross and wanton manner, their wives and daughters being exposed to the most brutal treatment.

According to Mr. Hauteville, a nobleman who is desirous of cultivating a piece of land, builds a little wooden house, in which he settles a peasant and his family, giving him a cow, two horses, a certain number of geese, hens, &c. and as much corn as is sufficient to maintain him the first year, and to improve for his own future subsistence, and the advantage of his lord. In return, he obliges him to till a particular quantity of land, and to pay a number of live animals out of the produce of the original stock.

In autumn all the peasants are employed in cutting down and reaping the master's harvest, who appoints overseers to reward the diligent, and punish the indolent with stripes. Pillories are erected in every village, on which these wretched beings are obliged to stand a whole day, for crimes of a very trivial nature.

One blessing, however, attends the wretched situation of the Polish peasants, which is their insensibility. Born slaves, and accustomed from their infancy to hardships and severe labour, they scarce entertain an idea of better circumstances and more liberty. They regard their masters as a superior order of beings, and hardly ever repine at that severe lot which has deprived them of all the comforts of life, in order to heap them upon a cruel, despotic, and unworthy tyrant. They seldom want for provisions, and think that a man can never be very wretched while he has any thing to eat. Our author adds, a total want of sentiment, and of mental enjoyments, prevail through the whole order, as if Providence had wisely mixed the stupifying drop, to render more tolerable the nauseous draught of servitude.

This is the boasted liberty of the Poles, in which the multitude are reduced to the most abject slavery; and those who enjoy estates, though ever so small, are allowed the privilege of being tyrants, and have greater power over their vassals, than God ever gave to kings. But now let us take a view of the property of the great, and see in what their wealth consists.

Every Polish noble must be possessed either of an estate in land, a share in the salt-works, or the revenues of the city of Dantzic, which are esteemed equivalent to an estate in land. The Polish estates in general may be divided into royal, ecclesiastical, or patrimonial. The greatest number of them consist in starosties, which must be given away by the king six months after a vacancy, and are regarded as the rights of old military officers, and the reward of their past services, the word starost signifying old age. Each starosta pays a fourth of his revenue to the republic.

The ecclesiastical estates consist of bishoprics, benefices, priories, canonries, and all the land possessed by the regular clergy, which is of vast extent. Some of the bishoprics exceed five thousand pounds sterling a year, which is an immense sum of money in a country that does not abound in specie.

The patrimonial estates compose the solid wealth of the Polish nobility, they being entirely independent of the court, and descend by inheritance from generation to generation. These consist of lands, houses, towns, villages, woods, and especially peasants, which are va-

lued as the slaves in our colonies, at so much a head, according to their age, strength, and constitution. They are in general reckoned worth a hundred livres each a year, to the master, and have only one chance for becoming free, by entering into orders, and enrolling themselves in the long catalogue of priests and friars, for which a very small degree of learning is necessary: but as it is for the interest of the master to disqualify them, he obliges them to marry when young, and by this means not only preserves, but increases his wealth, by the multiplication of the species.

S E C T. IV.

Of the State of Religion in Poland.

THE Poles were first converted from idolatry to the Christian religion, about the year 964; when St. Adelbert, afterwards archbishop of Gnesna, was the instrument of this revolution; and the arts of the church of Rome have, since that time, kept the Polish government firmly in the interest of the Romish pontiff. Hence popery is the national religion; for none but persons of that persuasion are permitted to sit in the senate, rise to eminence in the army, or preside in the courts of justice; yet the government tolerates Lutherans, Calvinists, Jews, Armenians, and Greeks.

Formerly Poland had a number of Protestants of many different sorts, which were established there soon after the Reformation, when above half the nobility of the kingdom became Socinians, and the palatine of Podolia erected a printing-house, and founded an academy for their use; but they were expelled by John Casimir in 1658. The bulk of the Protestants now reside in Polish Prussia, at Dantzic, Elbing, Thorn, and Marienburg, where they enjoy privileges which are not granted in any of the other provinces.

Indeed, the Lutherans, Calvinists, and Greeks, by the treaties concluded with the Protestant powers, and particularly the constitution of 1717, are promised security as to their effects, and an equality with the other subjects as to their persons. The Protestants therefore, by virtue of the above articles, have frequently solicited for the free exercise of their religion, and the Protestant powers have interested themselves in their behalf, which has procured them many fair promises that have not been fulfilled. On the contrary, a great number of their churches have actually been taken from them, or demolished; and with respect to these dissenters from the established church, the laws of justice and equity have been violated; so that they have now only twenty-two churches in the cities and towns, and sixty-five in the villages of Poland. The Greeks are also no less oppressed; yet the Jews, before the present reign, were indulged with great privileges; and this country is stiled the paradise of that people. An old Polish general, who was a native of Germany, says, that there are at least two millions of Jews only in the villages of Poland, exclusive of the great numbers in the towns. Their annual capitation amounts to two hundred and twenty thousand Polish guilders in the kingdom of Poland, and a hundred and twenty thousand in Lithuania, amounting in the whole to fifty-six thousand six hundred and sixty-six rix-dollars, which they pay above the general imposts and taxes.

The king is here stiled Orthodoxus, as a title of honour, and St. Florian and St. Adalbert are worshipped as the patron saints of Poland.

The number of monasteries in this kingdom amounts to five hundred and seventy-six, and of nunneries to one hundred and seventeen, besides two hundred and forty-six seminaries or colleges, and thirty-one abbeys. The clergy are even possessed of two-thirds of the lands and revenues of the kingdom.

The monks of Poland are wealthy, profligate, and debauched in their manners; they are often seen drunk, and led from taverns, without apprehending any disgrace to their order, or dreading the censure of their superiors, who require equal indulgence. Their fasts consist in abstaining from eggs, milk, and boiled fish at night. But though no clergy on earth are so attached to the see of Rome

Rome as the Polish, yet they prefer good living even to the opinion of the pope, and therefore confine their abstinence from animal food wholly to the evening.

The secular clergy admit of pluralities, and hold profitable benefices in the most distant parts of the kingdom, without being ever supposed to perform any of the duties of their office. A canon gives two-pence to a poor scholar or a monk, for going through the drudgery of the mass, as his substitute. Even the bishops are said to be so negligent about the due execution of episcopal duties, that they are forced to wink at the enormities of their inferiors; yet the few clergy who attend the duties of their profession have all the appearance of piety, and the laity make up for every other deficiency by their bounty to the church. They will grind the face of the poor to found a monastery, cheat and defraud in order to enrich an altar. In these particulars Poland is now what the more civilized nations of Europe were two centuries ago. All their churches are built by donations: they are in general rich and magnificent, and the jesuits at Leopold have a chalice set with jewels, said to be worth a million of livres. So zealous are the Poles in the catholic faith, that they draw their swords at mass, to shew their readiness to defend their religion by slaughtering its opposers.

As to the erudition of the clergy, a late author observes, it entirely consists in that species of sophistry called school divinity, in an unmeaning metaphysical jargon, and the most useless logical distinctions. The divines pride themselves in adapting the metaphysics of Aristotle to the doctrines of Christianity, by which they render the latter as unintelligible as the former. They pay no regard to church history, but solve every difficulty by the affirmations of the Stagyrice, and the decisions of the pontiff. In a word, they are ignorant, obstinate, opinionated, and superstitious.

S E C T. V.

Of the political Constitution of Poland. The very limited Power of the King; the general Contents of the Pacta Conventa; the Ceremonies of the Coronation; the arms of Poland; and the Badge of the Knights of the White Eagle.

THE political constitution of Poland is so extremely singular, that it bears no resemblance to any other government, ancient or modern. The people have a sovereign, and yet the government is with great propriety called a republic. The reader has seen that the nobility of this country have greater power than those of any other, yet they detest the thoughts of an aristocracy; because they all esteem themselves upon a level, each Polish nobleman or gentleman considering himself as inferior to none but the monarch.

The republic is composed of the king, the senate, and the nobility, the peasants being admitted to no share of the government. Upon every new election the royal prerogative has been retrenched, and the liberties of the diet and senate proportionably extended. This idea of independency is carried so far, as to hazard the general security of the kingdom, the monarch not being permitted to garrison even the most remote and necessary frontier towns; whence Poland has in all ages been made a kind of public route for the passage of hostile armies.

Upon the death of the sovereign, the whole body of the nobility assemble on horseback for the choice of a successor, and their unanimous voice constitutes a legitimate election; though there have been instances, where a majority have been deemed sufficient. Here the nobility assume a power of altering the government, and imposing such conditions on the new monarch as they think proper, and these they call the Pacta Conventa. This contract is drawn up, methodized and approved by the senate and nobility, after which it is read aloud to the king by the great marshal, and he swears to perform it before the ceremony of his proclamation. As this contract may be deemed the barrier of the privileges of the Poles against the encroachments of the crown, we shall here enumerate the principal articles.

The first is, that the king shall not attempt to encroach on the liberty of the people, by rendering the crown hereditary in his family, but shall preserve all the laws and customs relating to the freedom of election: that he shall ratify all the treaties subsisting with foreign powers which are approved by the diet: that he shall study to cultivate peace, preserve the public tranquility, and promote the interest of the realm: that he shall not coin money, except in the republic's name, nor appropriate to himself the advantage arising from coinage: that he shall neither declare war, conclude peace, levy troops, hire auxiliaries, or admit foreign troops into the Polish dominions, without the consent of the diet and senate: that all offices and preferments shall be given to the natives of Poland and Lithuania, and that no pretence shall excuse the crime of introducing foreigners into the king's council or the departments of the republic: that the officers of his majesty's guards shall be Poles or Lithuanians, and that the colonel shall be a native of Poland, and of the order of nobility: that all the officers shall be subordinate to the authority of the marshal: that no individual shall be vested with more employments than the law allows: that the king shall not marry without the approbation of the senate, and that the republic shall regulate the household of the queen: that the sovereign shall never apply his private signet to acts and papers of a public nature: that, on the other hand, the king shall dispose of the offices both of the court and of the republic: that he shall regulate with the senate the number of forces necessary for the defence of the kingdom, and administer justice by the advice of the senate and council: that the expences of his civil list shall be the same with those of his predecessors, and possessed by his family only during his life: that he shall fill up all vacancies in the space of six weeks: that this shall be his first business in the diet, obliging the chancellor to publish his appointments in due form: that the king shall not diminish the treasure kept at Cracow, but endeavour to augment that and the number of the crown jewels: that he shall neither borrow money, nor equip a naval force, without the consent and full approbation of the republic: that he shall profess, promote, and defend the Roman catholic faith through all the Polish dominions; and finally, that all their several liberties, rights, and privileges, shall be preserved to the Poles and Lithuanians in general, and to all the districts and provinces within each of these great divisions, without change, or the smallest violation, except by the consent of the republic. To these articles a variety of others are added, according to the circumstances and humour of the diet; but the above are the standing conditions, which are scarce ever altered or omitted.

The king swears to observe the Pacta Conventa upon his knees at the altar in the following manner: "We ***, elected king of Poland, and great duke of Lithuania, Russia, Prussia, Massovia, Samogitia, Kihovia, Volhinia, Podolia, Podlaffia, Livonia, Smolensko, Siberia, and Czernicovia, promise before the Almighty God, and swear upon the holy evangelists of Jesus Christ, to observe, maintain, and fulfil all the conditions stipulated at our election by our ambassadors with the senators and deputies of Poland, and of the great duchy of Lithuania, and confirmed by our plenipotentiaries; and to execute the same in all the clauses, points, articles, and conditions specified in that contract, in such a manner, that the *speciality* shall not derogate from the *generality*; nor, on the contrary, the *universality* from the *particularity*; all which we promise solemnly to ratify on the day of our coronation."

Though the king is without exception acknowledged to be their sovereign, yet he cannot exercise the functions of sovereignty before his coronation. The space between the election and coronation is a kind of interregnum, though he is vested with all the badges and external pomp of majesty. During this period the marshal, in all processions, carries his staff bent downwards before the king; but after the coronation it is always held erect. This is to shew that the election is imperfect till it be ratified by the coronation, previous to which the king can neither dispose of offices or benefices, grant favours of any kind as a sovereign, nor apply the great seal to any act or ordinance. He appoints the day for performing

his coronation, which is usually on that succeeding the funeral obsequies of his predecessor. All imaginable magnificence is observed on this occasion, and a foreigner, unacquainted with the Polish constitution, would naturally conclude, that a monarch who ascended the throne with such pomp and splendor, was invested with very extensive prerogatives.

When the coronation-day approaches, the king makes his entry into Cracow on horseback, with a canopy of state carried before him. The troops, both horse and foot, march before with their officers, and are followed by the palatines, bishops, and ambassadors on horseback; while a man, who rides before, scatters some small pieces of silver, stamped with the effigies of the new king; who is thus conducted from the city gate to the castle, passing through the public square, in which are several triumphal arches. On the day that precedes the coronation, the body of the deceased king is carried in great state to the church of St. Stanislaus, at Shalka, where the marshals break their staves, and the chancellors their seals, against the king's coffin. The new king, with all his courtiers, and the officers of the crown, are present at this ceremony. The companies of tradesmen even walk thither bare-foot in procession, each having the representation of a coffin covered with a pall, supported by two men; after which the corpse is brought back to the chapel of the cathedral of Cracow, where are the sepulchres of their kings.

The next day the coronation is performed in the cathedral of Cracow, to which the king is conducted in solemn state by the senate, and the rest of the nobility. The regalia are placed upon the altar, and the bishops of Cracow and Cujavia present the king to the archbishop of Gnesna, to whom he bows, and then all the three prelates remind him of his duty; after which he kisses the archbishop's hand, kneels, lays his hand on the gospels, and again swears to the Pacta Conventa; to which is added, that if he should violate his oath, or any part of it, the subjects shall be discharged from their obedience and oath of fidelity. Then receiving the benediction of the primate, and other bishops, his upper garment is taken off, and the primate anoints his right hand and arm up to the elbow, and also his shoulders and forehead with consecrated oil, saying, "In the name of the Father, of the Son, and of the Holy Ghost."

The king is then led to the chapel, where he is dressed much like a bishop, and has other ornaments put on him by the marshals of the kingdom and duchy, in which he hears mass on a throne erected in the midst of the church; and afterwards goes to the altar, where the archbishop, putting a drawn sword into his right hand, says, "Receive this sword, and cordially protect and defend the holy church against all unbelievers." The sword-bearer then puts it up in the scabbard, and returns it to the archbishop, who girds it to the king's side: but his majesty drawing it, waves it several times over his head. The king then kneels, and the archbishop places on his head the crown, which is supported by the bishops of Cracow and Cujavia. After some prayers, the archbishop puts the scepter into the king's right hand, and the globe of gold into his left. The primate and two archbishops then lead the king back to the throne, in which the archbishop places him, saying, "Sit and maintain the place God has given thee." The king returns again to the altar, and Te Deum being sung, his majesty kisses the archbishop's hand, offers him gold, confesses, receives the sacrament, and the bishop's benediction; after which the court-marshal cries out several times, Vivat Rex, and the treasurer of the kingdom scatters money among the people in the church.

The next day the king goes in great pomp to the town-house, with the regalia carried before him, and the great treasurer again throws medals of gold and silver among the people. His majesty being there placed on a throne, receives the homage and oaths of the diet, &c. on their knees, and the magistrates of the cities present him with the keys of their gates in a silver dish, and a purse full of ducats; after which he restores the keys, and makes some of the burghers of the city knights, by striking them gently on the shoulder with his drawn sword.

As the king is obliged by the Pacta Conventa to consult his people with respect to marriage, so their consent is necessary to the dissolution of the nuptial engagement; for he can neither divorce the queen, nor separate from her bed, without the approbation of the diet, unless he was married before his election. Her majesty has a distinct household, except a marshal, a chancellor, and some inferior domestics. She is furnished with money by the king to defray the expences of the civil list; and, with respect to her domestic œconomy, is little more than his house-keeper or steward. The king's whole revenue for the support of his regal dignity does not exceed four hundred thousand crowns; exclusive of which there is a maintenance for the queen-dowager, his consort, and children, in case of his death; though the latter are denied the privilege enjoyed by other subjects, of rising to places of trust and profit, lest this should give them an ascendant in future elections.

The arms of the republic are, gules, an eagle argent, for Poland; and gules, a cavalier argent, for Lithuania.

In the year 1705, king Augustus II. instituted the order of the white eagle; whose ensign is a cross of gold enamelled with red, with a white border, and four flames between the points, appendant to a blue ribbon. On one side of the badge is the Polish white eagle, with a white cross and the electoral sword, &c. on its breast; on the other side the king's cypher, and round it this motto, PRO FIDE, REGE, ET LEGE. The cross is surrounded with a crown set with diamonds.

S E C T. VI.

Of the Senate of Poland.

THE most respectable part of the Polish government is the senate, which is composed of the bishops, palatines, castellans, and ten officers of state, who derive a right from their dignities of sitting in that assembly, amounting in all to a hundred and forty-four members, who are stiled senators of the kingdom, or counsellors of state, and have the title of excellency, a dignity supported by no pension or emoluments necessarily annexed to it. The senate presides over the laws, is the guardian of liberty, the judge of right, and the protector of justice and equity.

The members are nominated by the king, and take an oath to the republic, before they are permitted to enter upon their office. Their honour continues for life, and at the general diet they are seated on the right and left of the sovereign, according to their dignity. They are the mediators between the monarch and the subject, and, in conjunction with his majesty, ratify all the laws passed by the nobility. The value they set on their dignity makes them despise all other honours, and they have even rejected the titles offered them by the emperor of Germany. As a senator is bound by oath to maintain the liberties of the republic, it is thought no disrespect to majesty to remind him of his duty; for as they are his counsellors, this freedom of speech is an inseparable prerogative of their office.

All the bishops are senators, and precede the secular members: they are only thirteen in number, besides two titular bishops of places seized by the Turks and Russians; but still the titular honours are retained, and eagerly sought after, because they give them a right to sit in the senate. The archbishop of Gnesna is seated at their head, and is second only to the monarch; he is also apostolical legate by his office, and enjoys such variety of privileges as gives him extraordinary weight, not only in the senate, but in the common-wealth; for it is a capital crime even to draw a sword, or to speak irreverently in his presence. During the inter-regnum he has the power, under certain restrictions, of coining money: he convokes the senate; and opposes the conduct of the monarch whenever he acts contrary to the constitution: his marshal is a senator, and the cross is carried before him. When the primate visits the king, he is met at the bottom of the stairs of the palace by one of the chief officers of the crown; another great officer attends him at the top of the stairs, and conducts him to the royal presence, while

while the king advances to meet him at the door. He receives the visits of ambassadors without being expected to return their civilities. He is the head and sovereign of the republic during a vacancy of the throne. He likewise regulates the diet of election, issues out writs for holding the general and petty diets, and performs several other acts of sovereignty, assisted only by the senate, the members of which rather compose his council, than are his colleagues. The Poles probably annexed these extraordinary privileges to the primate rather than to any lay senator, from their being secured by his religious character from his aspiring after the crown.

The office of palatine is to march at the head of the nobility of his palatinate, and in time of peace to assemble the nobility, to preside in the courts of judicature, and pronounce sentence; to settle the price of goods brought to market, except in war-time, and during the session of a diet; to examine weights and measures, and to protect and administer justice to the Jews. These palatines amount to thirty-seven, including the three castellans and the starosta of Samogitia, who rank with the palatines.

There are eighty-two castellans, who in time of peace are only senators, without any jurisdiction; but in time of war they, by general summons, act as palatines, and are in some measure their lieutenants. In the Polish language a castellan is styled pan, or lord, and ki, or ski, is added to the place over which each is castellan, as pan Posenanski, lord of Posen. They are divided into great or little castellans. The great castellans are admitted into the most secret councils, from which the others are sometimes excluded.

The crown officers are, the crown great-marshal, the great-chancellor, the vice-chancellor, the great-treasurer, the deputy-treasurer, and the court-marshal of Poland, and all the same officers of Lithuania.

Though these state officers are the last of the senators in order, yet they are persons of great power and dignity, and in a fair way of rising to the highest posts in the kingdom.

S E C T. VII.

Of the Polish Diet.

WE now come to the diet of Poland, which is composed of the king, the senate, and deputies of the nobility of every palatinate; and is usually held on two accounts, either to consider of the resolutions of the senate relating to the public welfare, or for the administration of justice, which are the most usual diets.

The king may assemble the diet at any particular place, except on occasion of a coronation, which, according to the custom of the country, must be celebrated at the capital. Indeed for a number of years the diet regularly assembled at Warsaw; but, on complaint made by the Lithuanians, it was agreed, that every third diet should be held at Grodno. The general rule is to meet at least once in three years. When it is proposed to hold a general diet, the king, or, in case of an interregnum, the primate, issues writs to the palatines of the several provinces, appointing the time and place of meeting. A sketch is also sent of the business to be deliberated upon by the assembly, and the members are allowed six weeks to prepare for the intended session.

It is remarkable that the diet never sits above six weeks, even in the most critical conjunctures and pressing emergencies; and they have been known to break up in the midst of an important debate, and to leave the business to a future meeting. This has been justly esteemed one of the great defects of the constitution of Poland: it probably owes its origin to convenience; but is kept up from whim and caprice.

On receipt of the king's writ, the palatine communicates the meeting of the diet to all the officers and nobility within his jurisdiction, requiring them to assemble on a certain day, to elect deputies, and take into consideration the business mentioned in the royal summons. These meetings are called petty diets, every gentleman possessing three acres of land having a vote, and matters being determined by a majority; but in the general diet decrees

are only valued when the whole body is unanimous. These indigent nobles are always directed by some person of superior fortune, influence, or ability, and seldom examine the subject of the debate; but remit it wholly to the judgment of their representatives. Every palatinate has three representatives; but the business devolves upon one of them, who is elected for his ability and experience, and the other two are only added to give weight to this leading member, and to do honour, by their magnificent appearance, to the palatinate they represent.

As these deputies have seats in the diet, the general assembly is divided into two bodies, the upper and the lower; the one being composed of the senate, the superior clergy, and the great officers; the other of the representatives of the palatinates, who prepare all business for the superior body. Thus we see how near an affinity the general constitution of the Polish diet has to a British parliament, and to the original form of government among all the northern nations, however they may vary in particular circumstances, and be altered by the influence of time.

The first business of the assembly is to choose a marshal; upon which occasion the debates and tumults sometimes run so high, that the whole time for the session of the diet is consumed in altercation and wrangling about the election of a speaker, who must be a native of Great or Little Poland, or of the duchy of Lithuania. After his election he kisses the king's hand, and the chancellor, as the royal representative, reports the matters to be deliberated upon by the diet. The marshal then acquaints the king with the instructions of the deputies from their constituents, and the abuses they require to be remedied; he likewise requests his majesty to fill up the vacant offices and benefices according to law, and is answered by a set speech from the chancellor, who reports the king's inclination to satisfy his people as soon as he has consulted his faithful senate.

Some of the customs observed by the Polish diet are remarkably absurd; not only an unanimity of voices is necessary to pass any bill, and constitute a decree of the diet, but every bill must also be assented to unanimously, or none can take effect. Thus, if out of twenty bills one should happen to be opposed by a single voice, all the rest are thrown out, and the diet meets, deliberates, and debates for six weeks to no purpose. Can any thing be more astonishing, than that a rule so contrary to the dictates of common sense, and attended with such fatal consequences, should continue among a people who appear far from being void of understanding?

The usual form of passing laws and decrees is as follows: they are first revised by the marshal, attended by two of the deputies, or else by three senators and six deputies, and then read in the senate in the king's presence; after which the chancellor asks, with a loud voice, whether the king, senators, and deputies, agree to have the bill sanctified by the royal seal, and the arms of the republic. Having passed through these forms, it is lodged in the register at Warsaw, or in the great chancery of the kingdom, till printed copies are made, and dispersed among the several palatinates.

The diet takes cognizance of affairs relating to war, the conclusion of a peace, the forming alliances, the imposition of taxes, the levying of troops, the framing of laws, and the final determination of civil and criminal causes; there being an appeal from all the inferior courts to the general diet. Here too foreigners are naturalized, and admitted to all the rights of the natives; and such peasants as have sufficient wealth and ambition, are advanced to the rank of nobility.

The afflux of people occasioned by the diet is very astonishing: wherever it happens to sit, thirty or forty thousand people, who rival each other in pomp and profusion, are added to the usual number of inhabitants. The nobility, who are not deputed, attend with their families for the sake of pleasure: they drink deep of Hungarian wine, their favourite liquor, and feasting and mirth are more pursued than the business of the state. Hence the deputies frequently come intoxicated into the diet, affront the king, excite tumults, harangue with the most abusive and factious eloquence, and sometimes occasion the dissolution of the assembly. Thus the supreme

senate

senate of the nation is in fact little more than a factious mass, conducted with the utmost indecorum. However, a politic prince may mould this turbulent multitude according to his pleasure, by soothing, cajoling, treating, and making pecuniary presents.

Besides the regular triennial great diets, a particular diet meets, as hath been already hinted, on the vacancy of the throne, in a large field in the neighbourhood of Warsaw. Upon the death, deposition, or abdication of the sovereign, the primate, on whom the chief power devolves, issues circular letters, summoning the diet to assemble on an appointed day. A kind of booth of prodigious extent is erected, to shelter the electors from the weather, and deputies are elected in the usual manner in the petty provincial diets. A marshal is chosen by the nobility, who must be confirmed by the senate. These last, with the nobility, then form an association, and enter into the most solemn engagements to adhere to the same interest; not to nominate a king till one of the candidates has obtained their unanimous consent; to preserve all the rights and immunities of the republic; to enter into no engagements with any of the candidates, or their ambassadors, till all the abuses, irregularities, and grievances of the republic be fully redressed; to insist upon the repeal of all the decrees, and even of the royal statutes that have any tendency to encroach on public liberty; and to support the court of justice established for preserving order, enforcing the laws, protecting the state, coining money, and performing all the offices of the executive power, during the vacancy in the throne; to prohibit all strangers from approaching the diet; to forbid the carrying of fire-arms to this assembly; to oblige the principal military officers to swear fidelity to the state; to exert no undue influence, and to use the army only against the enemies of their country; to defend the frontiers, and secure the honour and liberty of Poland and the great duchy of Lithuania; to oblige the officers also to swear, that in case of any sedition or revolt they will assert the public interest, restrain the soldiers from acts of violence, and receive no money upon any pretence whatsoever from the clergy, laity, the candidates, or their ambassadors. They also engage to oblige the officers not to advance to the heart of the kingdom with their troops, nor to approach the diet; and neither to augment or diminish the army but by the diet's consent. Lastly, the treasurers of the crown are forbid to issue out money without the approbation of the senate, except for the pay of the army.

When the marshal is elected, and a court of justice is established, the diet draws out a bill of grievances and abuses, either with respect to the republic or to individuals, which they intend to have redressed. A certain number of senators are then deputed to the army to keep them steady, and to assist the generals with their advice. Senators and deputies are also appointed to take an inventory of the crown treasure and jewels deposited at Cracow, and to make their report to the diet. Eight senators are then charged with the treasure, and a particular seal and key is given to each, that none of the keepers may singly have access. The same form is observed with respect to the crown revenue.

During the session of the electoral diet, which is limited to fourteen days without prorogation, all courts of justice, except that of the marshal, are suspended till the coronation is over. The next proceeding is to give orders to the plenipotentiaries of foreign powers, and the advocates of the candidates for the crown. The pope's legate is honoured with the first notice, as being the representative of Christ's vicar, the sovereign of princes; then the ambassador of his imperial majesty, who is succeeded by those of France, and other catholic powers. They make their speeches in Latin, and are answered by the bishop of Gnesna and the marshal of the deputies. But in general it is not the most persuasive oratory that can gain the esteem of a Polish diet: the deputies desire more substantial arguments, and expect their passion for money and wine to be also gratified. Addresses in this particular, and in securing the interest of the clergy, are the chief qualities necessary in a candidate for the crown.

Immediately before they proceed to the election, public prayers are read, and the whole diet join with one

voice to beseech heaven to direct their choice, and judge them according to their integrity in an affair of such consequence to the republic; a proceeding that must appear equally absurd and impious to those foreign ministers who have purchased their votes. The deputies of each palatinate give their votes in particular *rotas*, the archbishop alone preserving his seat. The first senator of every palatinate numbers the votes, which are afterwards transmitted in a roll to the nuncio-marshal. Should all the votes prove unanimous in favour of one candidate, the primate asks three times, with a loud voice, whether the grievances have been redressed, and then proclaims the king, the marshals of the crown and duchy of Lithuania observing the same ceremonies. In case of a contested election, the senate assembled in a particular part of the booth endeavour, by persuasions, promises, and menaces, to bring all the electors to one opinion; and should this be found impracticable, the majority is declared, and their opinion passed for a legitimate election, though this is diametrically opposite to the fundamental constitution.

SECT. VIII.

Of the Strength of Poland, with respect to its Fortifications and military Forces.

ONE of the most extraordinary parts of the constitution of Poland, is the manner of raising and maintaining the militia. Originally Poland was an open country, as at present, without fortresses; but, in course of time, the government caused fortifications to be erected in the cities, in order to oppose the incursions of the enemy: these were subject to royal authority, and defended by regular garrisons; but as they were found to increase the power of the monarch, by erecting a kind of standing army, with which some ambitious prince might destroy the liberties of the people, some of the citadels were demolished, and others neglected. They were then usurped by the neighbouring lords, who by this means extended their authority over the citizens and burghers, as well as over the peasants on their own estates.

Hence there are at present few fortified places either in Poland or Lithuania: for the Poles alledge, that the bravery of the inhabitants is the defence of their country. Kaminiac, on the frontiers of Podolia, owes its strength more to nature than art. The boasted fortifications of the city of Zamosk, if compared with the fortified towns of other countries, must appear very inconsiderable; and all the towns which formerly stood a short siege, are now open and defenceless. Hence Dr. Busching observes, that "when a foreigner reads of fortified places in Poland, he must not suppose that such expressions signify any thing more than a ditch, a rampart, a wooden or a stone wall, with which such places are surrounded. Dantzic is the only place that deserves the name of a fortress in the Polish dominions; but this is an independent city."

No such thing as a standing army kept in constant pay was formerly known in this country; but all that were capable of bearing arms took the field on any emergency: but in the year 1551, the Lithuanians, for their own security, first began to keep on foot a certain number of troops, and their example was followed by the Poles, who raised an army to defend their frontiers from the ravages of their lawless neighbours, who live on plunder. These troops are now divided into the crown army, and that of Lithuania; but some of the troops in both armies are clothed and exercised in the Polish, and others in the German manner.

The crown army consists of a thousand spear-men, three thousand nine hundred and forty cuirassiers, a thousand light armed troops, which are all disciplined in the Polish manner; four thousand dragoons, six thousand seven hundred and fifty foot-soldiers, eight hundred and fifty matrosses, and four hundred Hungarians; all these, except the last, are under the German discipline.

The Lithuanian army is composed of four hundred men bearing lances or spears, above eleven hundred and sixty cuirassiers, four hundred and sixty Tartars, two hundred

hundred and forty Cossacs, four regiments of dragoons, three regiments of foot, and a hundred and fifty mactrosses.

The charge of these troops is defrayed in Poland by a poll-tax; but in Lithuania other taxes are levied for this purpose. The soldiers also receive, besides their pay, what is called winter-quarter money, and are mostly cantoned on the crown lands.

Besides this small standing army, which receives constant pay, Poland, on any pressing exigency, is provided with another that can speedily be raised, and is of little expence to the public: for on any sudden and important danger, the whole body of the nobility are summoned to appear in the field on horseback, and this army is called the *pospolite*. This is concluded upon in a diet, after having been previously proposed in the provincial meetings, and is done by royal letters, with the seals of the kingdom, and the great duchy of Lithuania. These being fastened to poles by the summoners, are carried to the principal noblemen, state officers, and persons of rank in every palatinate, and read in the market-places of the cities and towns. When this has been three times repeated, the nobility, after holding their assemblies in their palatinates and districts, appear in the field on horseback, and, during the campaign, provide subsistence for themselves.

All gentlemen who live in cities and towns upon the interest of money; all tenants who have procured leases for a term of years, which indeed are extremely uncommon in Poland; all the king's tenants; the ecclesiastical advocates in the spiritual courts; and, in case of imminent danger, all the citizens in general; and even the gentry imprisoned for high crimes, are dismissed to attend the *pospolite*, being afterwards bound to return to their confinement, to stand trial, and suffer the punishment due to their crimes, unless they have merited a pardon by some signal acts of valour in the service of their country.

At present this body is entirely composed of cavalry. There is also a small body of infantry raised at the expence of the citizens, worth four thousand florins; the more wealthy burghers are obliged to find a horseman compleatly armed. In the great duchy of Lithuania the clergy are also obliged to fit out a number of men, in proportion to their temporal and spiritual possessions. The poor gentry may either appear in person, or subscribe to equip one horseman for a certain number of estates; and brothers who are joint proprietors, may depute one person to represent them all. However, the court and retinue both of the king and queen are exempted from taking the field. The primate also is vested with a power of protecting a certain number of the gentry within his jurisdiction from appearing in a military capacity; and this privilege is sometimes claimed by the bishop of Cracow.

The *pospolite* of every palatinate being assembled at the appointed place, are led by their proper officers to the general rendezvous, where the palatines surrender their several charges to the commander in chief. The Polish nobility squander the bulk of their fortunes in making a magnificent appearance in the field, and come with glittering arms, fine horses, rich trappings, and elegant apparel.

The cavalry is divided into *hussarts* and *tavarsies*; the former are chosen men and horse, both defended by close armour; the latter are covered only by a breast-plate, gorget, and helmet. Lances, sabres, and pistols, are the arms of the *hussarts*; and carbines, bows and arrows, of the *tavarsies*. The former dart their lances at a considerable distance; and, if they miss their aim, recover them by means of a silk cord fastened to the wrist. All the cavalry have the skins of wild beasts over their armour, and are stuck over with the wings of storks and other large birds, which give them a fierce appearance, and terrify the enemy's horse, which, when unaccustomed to so extraordinary a spectacle, cannot be brought up to the charge. As to the Polish light-horse, they differ little from the other troops, being armed with coats of mail and helmets, &c. These are sent upon all foraging parties and expeditions which require celerity; they being less encumbered with baggage.

As no suttlers are admitted into the camp, every Polish officer must provide himself provisions, and the cities and towns provide carriages and due military stores.

The king himself always marches at the head of his army: but after the nobility have been a fortnight at the general rendezvous, if no enemy appear, they are at liberty to return to their respective homes. These troops are not obliged to march beyond the limits of the kingdom; but if this be resolved, and the nobility voluntarily conform to it, every horseman and foot soldier previously receives five Polish marks, or about one pound two shillings and six-pence; and the campaign is not to last above three months. Such a general summons has not been issued since the year 1672; nor was it ever of any great advantage to the republic, on account of the short duration of the campaign, the want of good discipline, and obedience to their chiefs.

We have now given a particular account of Poland and its inhabitants in general, and shall therefore proceed to describe the several provinces, and the principal places worthy of notice.

The kingdom of Poland, according to Dr. Busching, consists of three principal provinces, viz. Great Poland, Little Poland, and the great duchy of Lithuania. This division, he observes, is of great utility with respect to the public law of Poland; according to which, the nation consists of three distinct people and three provinces, and the marshal in the diet is alternately chosen from each. But however convenient this division may be for the Poles, it does not appear to be so to the geographers, since even that gentleman has placed his account of Polish Prussia, which belongs to Great Poland, after Lithuania. We shall therefore give what appears to us a more natural division, in which the countries and people, who are, in some respects, remarkably different, will be less confounded by being classed together.

S E C T. IX.

Of GREAT POLAND, including Poland Proper, Cujavia, and Massovia; with the principal places in each.

GREAT Poland, including the above provinces, is bounded on the north by the kingdom of Prussia and Polish Prussia, on the east by Lithuania, on the south by Little Poland, and on the east by Silesia.

Great Poland, properly so called, contains five palatinates, the most remarkable of which are,

Posen, or Posen, the capital of the palatinate of Posenania, is a handsome but not a very large city, seated on the river Warta, in fifty-two degrees twenty-six minutes north latitude. It is inclosed with a double wall and a deep moat. On the other side of the river it has two suburbs, surrounded with a large morass; but both the city and suburbs are subject to frequent inundations by the overflowing of the river. The castle, which is a good structure, stands on an island in the same river. The city has several churches and convents, a jesuits college, an academy, which stands in the suburbs, and an episcopal seminary. The bishop's palace is near the cathedral, which is a fine structure. This is the most antient bishop's see in Poland, it being founded by the emperor Otho I. and made subordinate to the archbishopric of Magdeburgh, under which it continued till it was subjected to the archbishopric of Gnesna. It owes great part of its prosperity to its trade with Germany; for it is a staple town, and enjoys several other privileges.

Fraustadt, in the Polish language Uskowa, is a handsome town on the frontiers of Silesia, in latitude fifty-one degrees forty-five minutes, built by the Germans, from whom a great part of its inhabitants are descended; hence there are two Lutheran churches in the town. The inhabitants carry on a considerable trade in oxen and wool. Fraustadt formerly belonged to Silesia; but was annexed to the Polish dominions by king Casimir, who promised to maintain its former privileges, among which was the right of coining money. In the year 1644, this town was almost destroyed by fire, and in 1706 the combined armies of the Saxons and Russians were entirely defeated by the Swedes near this place.

Lissa,

Lissa, called by the Poles Leszno, is a fine populous town and lordship, near the preceding, in the territory of which it lies. It was formerly no more than a village, but great numbers of protestants removing thither from Silesia, Bohemia, Moravia, and Austria, and obtaining the free exercise of their religion, it increased till it became a considerable town. The inhabitants carry on a good trade, and have a Lutheran church, a seminary, and a Calvinist church: and the general-senior of all the Lutheran churches in Great Poland, formerly styled the superintendant, resides in this town. In 1656 the inhabitants deserted it for fear of the Polish troops, who plundered and laid it in ashes; and in 1707 it was laid waste by the Russians, but was afterwards rebuilt with great improvements.

In the palatinate of Kalisz is the city of Gnesna, called by the Poles Gniezno, the capital of Great Poland, and the most antient city in the kingdom. It is situated in a plain, and is not only a large town, but the see of an archbishop, whose power, as we have already observed, is next that of the king. A court of judicature is held in the town, and a particular chancellor belongs to the chapter of the cathedral, in which is the body of St. Adalbert enclosed in a silver shrine. There is also a seminary founded here.

We now come to the province of Cujavia, which is very fertile, and watered by many lakes, that abound with fish: the principal of these is the lake of Goplo. The bishop of Cujavia is a suffragan to the archbishop of Gnesna, and also styles himself bishop of Pomerellia. Cujavia contains two palatinates, the most considerable place in which is,

Uladislaw, a handsome city in the palatinate of the same name, seated on the Vistula. Here is a fine palace, in which the bishop of Cujavia resides. The cathedral is an antient Gothic structure, rich in plate, ornaments, and relics, and is encompassed by the houses of the canons and a large free-school.

Another province of Great Poland is Masovia, or Masuren, which, from the beginning of the Polish monarchy, has been considered as a part of that kingdom. It has been twice given to the queens of Poland as a dowry. No other religion but popery is tolerated in this province, those of other professions being treated with the utmost severity; for to such a height is the bigotry of the government carried, that if a Lutheran or Calvinist minister be found in Masovia, he is certainly punished with death. The number of noble families in this province are computed to be no less than forty-five thousand. Masovia contains two palatinates, in which are the following places:

Warsaw, the capital of Masovia, and the royal residence, is seated on the Vistula, almost in the center of the kingdom, in fifty-two degrees twenty-one minutes north latitude, and twenty-one degrees ten minutes east longitude from London. It is surrounded with a moat and double wall, and has a stately castle. Here are several elegant stone-buildings and palaces, a great number of beautiful churches and convents, an hospital, an arsenal, and a statue of king Sigismund III. erected to his memory by his son Uladislaus IV. The valuable library of count Zalusk, which was opened in 1746, said to contain above two hundred thousand volumes, is both an advantage and an ornament to the city. Some years since an academy for military exercises and a literary society were instituted at Warsaw. When the general diet is assembled, there is such a vast concourse of people, that great numbers of them are obliged to live in tents without the city, where they continue during the session. The provincial assembly, or diet, and a court of judicature are also held here.

King Sigismund III. was the first who made this city the royal residence, and his successors have resided here ever since. In 1655 this city had a Swedish garrison, who brought hither a considerable booty from several parts of Poland; and a great number of military and civil officers, with some ladies of distinction of that nation, resided there. But the Poles laid siege to it in 1656, and, after a vigorous defence, obliged the city to surrender. By the articles of capitulation, the Swedes were per-

mitted to leave the place; but the best part of the plunder they had amassed fell into the hands of the Poles. However, Charles Gustavus approaching with an army to relieve the city, king John Casimir marched against him, and a battle was fought near the suburbs of Praga, which lasted three days; but at last the Poles were obliged to retreat, leaving behind them their artillery and baggage; upon which the Swedes placed a small garrison in the town, and destroyed the fortifications. In 1702, Charles XII. of Sweden made himself master of Warsaw, which happened then to be without a garrison, and fixed his head-quarters at Praga.

In this province is also the city of Ploczko, which stands on an eminence by the Vistula, and affords a very pleasant prospect. It is the see of a bishop, who is suffragan to the archbishop of Gnesna: it is also the residence of a palatine, a castellan, and a starosta. Here are several churches richly ornamented, the principal of which belong to the nuns of St. Mary Magdalen and the Benedictine monks in the castle: the latter is the cathedral, and the revenues of the chapter are almost equal to those of the bishop. The provost, or dean, is lord of the district of Sielun, and sovereign of the nobility who reside there, and is accordingly styled prince of that territory. The jesuits have a college there, and in the castle is a seminary. The provincial court of judicature is held in the city, and its inhabitants carry on a good trade.

Polish Prussia is considered as a district belonging to Great Poland, merely perhaps from its bordering on that part of the Polish dominions: but this province deserves a particular description.

S E C T. X.

Of LITTLE POLAND, including Podlachia, Red Russia, Podolia, Kiow, and Volhinia; containing an Account of the principal Towns, particularly of Cracow, and the famous Salt Mines of Bochnia and Wiliska.

LITTLE Poland, which is also called Upper Poland, properly so called, contains the palatinates of Cracow, Sandomir, and Lublin, and has the following remarkable places:

Cracow, the capital of the whole kingdom, and the fixed head residence of the sovereign, is seated in a fertile country, at the conflux of the Vistula and the Rida-wa, in nineteen degrees thirty minutes east longitude, and the fiftieth degree of north latitude. The city contains a great number of convents and churches, and among the latter that of the Virgin Mary, which is the principal. On the west side of it is a suburb with handsome gardens, and near it is the king's palace, which has the advantage of elegant gardens inclosed with a wall. On the south side of it is the royal castle, seated on a high rock, near the Vistula. This large structure is defended by walls, towers, and bastions, and has the appearance of a town; it including the king's palace, the cathedral, and two other churches, with several dwelling-houses. The cathedral is dedicated to St. Stanislaus, formerly bishop of this see, whom Boleslaus II. killed at the altar with his own hands, because that bishop's admonitions were grown insupportable to him. St. Stanislaus's remains are inclosed in a silver shrine, and masses are continually performed day and night in this church. In the treasury of the cathedral, among other things of great value, are the regalia, on which account it is under the care of the treasurer of the kingdom. Here the kings of Poland are always crowned, and their remains interred. The annual revenue of the bishopric of Cracow amounts to forty thousand dollars. The chapter consists of thirty-six canons, besides other priests, whose revenues are also very considerable.

Contiguous to the castle is the suburb of Stradomo, which includes several churches, convents, and hospitals; and from thence a bridge over the Vistula leads to the town of Cazimierz, which may be considered as the second division of the city of Cracow: it lies to the east of the latter, was built by Casimir the Great, and is inclosed with a wall. The chief edifice in this part of the city

city is the university, which consists of eleven colleges, to which are subordinate fourteen grammar-schools, dispersed in several parts of the city. The Jews-town joins to Cazimierz. To the north of the city lies the suburb of Kleparz, or Klepardia, which has no walls, but contains several churches, particularly that of St. Florian, which is a very stately edifice, and the bishop's palace. The city of Cracow is large, and was formerly populous and flourishing; but by the removal of the court, and the many calamities it sustained in both the Swedish wars, has much declined. The citizens have this particular privilege, that no appeal lies from the city council, but to the king only; and his majesty can judge no causes relating either to the city or its suburbs in any other place but in Cracow. The palatine of this city has the power of choosing the council, but not of displacing any member when elected. The castellan of this city has hardly any thing in common with the other castellans; however, he has the same name and appointments, and by his post is entirely exempt from serving any other offices, except his being obliged to appear in council. This city has often been consumed by fire, and in 1707 and 1708 was visited by the pestilence, which swept away several thousands of the inhabitants. In 1655 it was besieged and taken by the Swedes; but in 1657 they were obliged to restore it to the Poles.

Bosnia is a town famous for its salt mines, which were first discovered in 1251, when this place was only a village. The small river Raab runs near this town, which is surrounded, with eminences. The salt mine is in a slip of land of seven hundred and fifty feet in breadth from north to south, about ten thousand in length from east to west, and its greatest depth is a thousand two hundred feet from the surface. The salt lies in veins, and is something finer than that of Wiliska, especially at a certain depth. It is cut in small pieces, and put up in casks. The number of labourers in this mine is about two or three hundred. Alabaster and large pieces of black wood have been found in this mine incrustated with salt, and every part of it is dry.

Wiliska is a small town, only famous for its mines, and is seated in a valley about five miles from Cracow. The town is entirely undermined, and the cavities extend for a considerable distance round it. The length of the mine from east to west is six thousand feet, its breadth from north to south is two thousand, and its greatest depth eight hundred; but the veins of salt are not limited to this extent, for the depth and length of them from east to west are yet unknown, and only the breadth has been hitherto determined. There are at present ten shafts, and within the whole salt mine there is not so much as one spring. Here a stranger is surprized on his descending to the bottom to find a kind of subterraneous common-wealth, consisting of a great many families, that have their peculiar laws and polity, and even public roads and carriages; horses being employed to draw the salt to the mouths of the mine, where it is taken up by engines. These horses when once they are down never more see the light of the sun, and many of the people seem buried alive in this strange abyss; some being born there and never stirring out, though others have frequent opportunities of breathing the fresh air of the fields, and enjoying the light of the sun. The subterraneous passages or galleries are very spacious, and in many of them chapels are hewn out of the rock-salt, and in these are set up crucifixes and the images of saints, before which a light is kept constantly burning. The places where the salt is hewn out, and the empty cavities whence it has been formerly taken, are called chambers; and some of these are so spacious, that a large church might be inclosed in one of them. Several of these chambers are made use of as warehouses for the salt casks, or barns for holding the fodder for the horses, and others serve for stables, in which stand twenty or thirty horses. In some chambers, where the water has formerly stagnated, the bottoms and sides are covered with very thick incrustations of some thousands of salt crystals, one upon another, many of them weighing half a pound or more; and when any candles happen to be brought, the numerous rays of light reflected by these crystals emit a surprising lustre.

In some parts of the mine huge columns of salt are left standing to support the rock. The number of miners employed are between four and five hundred, but all the men together who work amount to about seven hundred.

The salt lies near the surface in large shapeless masses, out of which blocks of sixty, eighty, or a hundred square feet may be hewn; but at a considerable depth it is found in smaller lumps. About six hundred thousand quintals of salt are annually dug out of these mines. The worst and cheapest is called green salt, from its greenish colour caused by an heterogeneous mixture of a greyish mineral, or clay, and entirely consists of salt crystals of different dimensions. A cask of this salt, which generally contains six quintals, sells for about twenty-two Polish guilders, each of one shilling and two-pence value; but a quintal of that in large masses or blocks is worth thirty-two or thirty-three florins, each florin worth about six-pence halfpenny. A finer sort of salt is sold for twenty-four florins per cask, and in large blocks at four florins the quintal. The third species of salt dug out of these mines is *sal gemmæ*, or crystal salt, which is found in small pieces interspersed in the rock; and when detached from it, breaks into cubes or rectangular prisms. This is usually sold unprepared. The colour of the salt stone is a dark grey mixed with yellow.

These salt mines have always made a part of the king's board revenues as they are termed, and are generally farmed; but sometimes the king has kept them in his own hands, and appointed proper officers for the management of them. The office of mine-master at Wiliska is hereditary, and a considerable salary arising from them is annexed to it.

The next town we shall mention is Sandomir, or Sandomir, the capital of a palatinate of the same name. This town is seated on an eminence near the influx of the river San into the Vistula; and its delightful situation rendered it the favourite residence of Casimir the Great, and other kings of Poland. This city is well fortified both by art and nature, and has a college of Jesuits and other orders, with a rich foundation called Collegium Canonicorum. A provincial court of justice is also held here. In the year 1259 the Tartars and Russians committed terrible ravages in this city, and put the inhabitants to the sword. In 1656 the castle, which stands on a steep rock, was blown up by the Swedes.

The next city we shall mention is Lublin, in the palatinate of the same name, surrounded by a wall and ditch; but though it is not large, it is a place of good trade. It has a castle built on a high rock, and stands in a very pleasant and fertile country. It has several churches and convents, a college of Jesuits, and a great number of Jews live in the suburbs; they have there a very spacious synagogue. In this city are held three annual fairs, each of which lasts a month, and these are frequented by a multitude of German, Greek, Armenian, Russian, Turkish, and Arabian traders and merchants. The chief tribunal for Little Poland is held in this city, besides the provincial diet and a court of judicature. In 1240 this city was set on fire by the Tartars, after which it continued for a long time in the possession of the Russians. It also suffered much by fire in 1447 and 1606, and in 1656 was reduced to ashes by the Swedes.

We shall now give a concise account of the countries dependant on Little Poland, and shall begin with Podlachia, or the palatinate of Bielsk, which is bounded on the north by Prussia and Lithuania; on the east by Lithuania; on the south by the palatinate of Lublin, in Little Poland; and on the west by that of Masovia, extending about eighty-eight miles in length, and thirty in breadth. This province was formerly the occasion of many disputes and quarrels between the Poles and Lithuanians. The most remarkable places it contains are,

Bielsk, a large city on the river Biala, situated in latitude fifty-three degrees four minutes. Not only the town but the castle and other fortifications are built with wood: it is, however, a place of great trade, which is carried on by the Jews.

Bialystoc, a city divided into the Old and New Town; in the latter of which is count Braniki's fine seat and gardens, which are much admired, and from their elegance

have been termed the Versailles of Poland. The greatest part of the city was destroyed by fire in 1753.

Tykoczin, a considerable town on the river Narew, and defended by a castle situated amidst inaccessible morasses. Here is held a court of judicature, and in this town Augustus II. instituted the order of the White Eagle, in the year 1705, which he conferred as a reward of courage and loyalty.

The last place we shall mention in this province is Augustow, a beautiful town, seated on a lake, and thus called from Sigismund Augustus, by whom it was founded.

Little or Red Russia, including Podolia, Polish Kiovia, and Volhinia, is bounded on the north by Lithuania; on the east by the river Nieper; on the south by Moldavia, Transylvania, and the Carpathian mountains, which divide it from Hungary; and on the west by Little Poland. The country is mountainous, but watered with abundance of rivers, which render it fertile in corn.

Red Russia Proper consists of the three palatinates Chelm, Belz, and Lemberg, the most remarkable places of which are,

Lemberg, called in Latin Leopoldis, and in Polish Lwow, is the capital of the palatinate of the same name, and is a large opulent city, situated in latitude fifty degrees thirty-two minutes, and in the fortieth degree east longitude from London. It is pretty well fortified in the Polish manner, that is, only with timber; and has two castles, one within and the other without the walls: the latter stands on a high hill, and the Carmelite monastery, which is fortified, may serve as a citadel to the castle. The city lies low on the banks of the river Peltew, encompassed with hills and mountains that command the town. Lemberg is not only the see of a Popish archbishop, but of a Russian and Armenian bishop.

Here is a magnificent cathedral, and several other churches, among which is a Russian and an Armenian church. The city has also some rich convents, and one belonging to the Dominicans which is said not to have its equal in Poland. There is likewise a college of Jesuits, a gymnasium, or seminary, an arsenal, a public granary, and two Jewish schools. A provincial diet and a court of judicature are also held in this city. The inhabitants are a mixture of several nations, but no protestants are tolerated amongst them.

Jaroslaw is a handsome town seated on the river San, and is defended by a castle; it carries on a good trade, and within the town is a college of Jesuits, and without it another foundation belonging to the same order.

Podolia, which is dependant on Red Russia, is a very fertile country; but has in all ages been exposed to the inroads of barbarous nations, who live on plunder, and have often ravaged it in a most cruel manner. It abounds with a fine breed of horses and horned cattle. The inhabitants were formerly governed by their own dukes or sovereigns, and are of a war-like disposition. Podolia consists of two palatinates, that of Podolia and Braclaw. The principal town in this country is,

Kaminiec Podolski, the capital of the palatinate of Podolia, which is situated in forty-eight degrees fifty-eight minutes north latitude. It has a castle built on a rock, and owes its strength more to nature than to art; however, it is esteemed the best fortification in Poland. Here is also a college of Jesuits; and the city is the see of a Popish and Armenian bishop. In 1651 the Cossacs laid siege to the castle, but without success; it was, however taken by the Turks in 1672, who held it till the peace of Carlowitz.

Of the palatinate of Kiovia, or Kiow, which forms a part of the Ukraine, and is inhabited by the Cossacs, we have already given an account in treating of Russia, which has all that part of this country that lies on the other side of the Nieper; so that Polish Kiovia includes only two districts, in which are several small towns scarce worthy of notice.

We now come to Volhinia, the last province dependant on Red Russia, a country so fertile, as to supply the inhabitants with a great deal more grain than they are able to consume. Rosemary and asparagus grow wild in the woods, and can hardly be distinguished from those cultivated in the gardens. Volhinia was annexed

to Poland in 1569, and in 1618, the country was ravaged by the Tartars, who besides a great booty, carried thirty thousand persons out of the country to be sold as slaves. This province contains two districts and several towns, among which are the following.

Lucko or Luceorien, the capital of Volhinia, which is seated on the river Ster, in fifty degrees fifty minutes north latitude, one hundred and seventy-five miles to the south-east of Warsaw. It has a castle, in which the bishop of Volhinia resides, and it is also the residence of a Russian bishop. The Jesuits have a college here, and it has a provincial diet, and a court of judicature; but in 1752, the greatest part of the city was destroyed by fire.

Olika, a handsome town and castle belonging to the Radzivil family, and the capital of a duchy. A school and seminary are founded in this town.

Sokal, a town and fortress on the river Bug, remarkable for a celebrated image of the virgin Mary, for the greater security of which, the Bernardine monks have built a fine church and convent, with suitable fortifications, on an island in the river Bug.

SECT. XI.

Of LITHUANIA, including Lithuania Proper, Lithuanian Russia, and the Livonian Palatinate, with the most remarkable Places in each.

Lithuania, called by the natives Litwa, is bounded on the north by Courland and Russia, on the east by Russia, on the south by Volhinia, and on the west by Little Poland, Podlachia, and the kingdom of Prussia. It was anciently very woody, and the greatest part of it lies uncultivated; but it is now greatly improved, by cutting down the woods, and the encouragement given to agriculture. Great quantities of pot-ash and wood-ashes are made here, and the country produces a considerable quantity of buck-wheat, and other corn. It has also great plenty of honey, with which mead and other palatable liquors are made. The meadows and pastures are very fertile, and afford nourishment to numerous flocks and herds, and the sheep yield fleeces of very fine wool. In the forests are bears, wolves, wild boars, buffaloes, deer, and prodigious flights of woodcocks. Here are also several lakes, in which are profitable fisheries. But notwithstanding the fertility of the soil, agriculture is not yet sufficiently encouraged; for some of the finest spots of land in the country still lie waste, and the luxuriant pastures in the meadows are neglected till the grass rots on the ground: for want of care the woods are frequently consumed by accidental fires. Provisions in general are extremely cheap; but this is the less surprising, where money itself is dear, and so scarce, that ten per cent is the common interest.

All the common people, except the burghers of the royal towns and the Germans, are vassals; but the nobility, who are very numerous, are for the most part indigent, and those who are poor serve the wealthy as stewards, treasurers, bailiffs, and valets. The noble families in better circumstances, endeavour to mend their fortunes by farming a large estate. There is scarce a single nobleman in tolerable circumstances in Lithuania without a title, of which they are all extremely fond, and these titles descend to their children. The principal nobility have estates equal to the revenues of some princes, and generally retain some hundreds of the poor nobility in their service. They are likewise invested with the highest posts in the kingdom; but live in such pomp and splendor, and with so little oeconomy, that their expences generally exceed their income.

Popery is the established religion of Lithuania; but there are also many Lutherans, Calvinists, Socinians, Jews, and Turks; but the Greeks are on a much better footing than any other of the dissenters. Though this country is so closely connected with Poland, it still retains its own peculiar laws, offices, and troops.

In a diet held at Lublin in 1569, the Poles and Lithuanians agreed, that the great duchy of Lithuania, and the kingdom of Poland should for the future be so united,

united, as to form but one state under one prince; that the sovereign should be elected in Poland by both nations; that the two nations should have a senate or council, and a house of provincial representatives in common; that the coin in the kingdom and dutchy should be of the same value, and that they should be equally concerned in treaties and alliances.

Lithuania is at present divided into nine palatinates, the two first of which constitute Proper Lithuania, and the others Lithuanian Russia, which is divided into White Russia, Black Russia, and Polesia. Besides these palatinates, Lithuania also includes the principality of Samogitia, and the dutchy of Courland, which is a fief of Poland.

Lithuania, properly so called, includes the palatinates of Wilna and Trock, the principal places of which are,

Wilna, the capital of Lithuania, stands on the river Wilia, near the influx of the Wilika, in fifty-four degrees thirty-two minutes north latitude, and is situated in a mountainous country. It is built on several little eminences, and has two considerable suburbs. In an old ruinous palace is the arsenal, and the hall where the court of justice is held, and opposite to it is a magnificent church that belongs to the castle. This church is very rich, and is also remarkable for the elegant marble chapel of St. Casimir, whose silver shrine is said to weigh thirty quintals. There are upwards of forty churches in this city, among which are one Lutheran and one Calvinist church, a Jewish synagogue, a Tartarian and a Greek church; but all the rest belong to the catholics.

Wilna twice suffered great devastations from the Russians and from fire; particularly in 1748, it was destroyed by a dreadful conflagration, when thirteen churches, the Jewish synagogue, twenty-five palaces, four hundred sixty-nine stone edifices, consisting of private houses, hospitals, inns, baths and convents, with a hundred and forty-six tradesmen's shops and dispensaries, besides a great number of granaries and warehouses, were consumed. The next year another fire happened by lightning, which burnt six churches, the council-house, eight palaces, and two hundred seventy-seven stone buildings. The chapel of St. Casimir was also burnt, and the loss sustained by the destruction of this edifice alone with its treasure, amounted to an immense sum. The churches have been since rebuilt at a very great expence, and some of them in a more elegant manner than before; but the city has not recovered its former grandeur.

This city is a bishop's see, and has an university, and a high court of judicature, besides a provincial diet.

Grodno, a large and handsome city, and next to Wilna, the best in Lithuania, is situated in fifty-three degrees thirty-eight minutes latitude, and in twenty-three degrees fifty-two minutes east longitude. It stands on the river Niemen, partly on an eminence, and partly on a level, and is encompassed with hills. The old castle, which is surrounded with a deep moat, is fallen to decay, so that no more than one wing of it is inhabited. The new palace is a large, regular, and beautiful structure, consisting of two stories: the great hall, that for the senate and the chapel, are its finest apartments; and in the court stands the chancery or state office, which is an elegant structure. In the city are nine popish and two Greek churches, and also a synagogue for the Jews, which is built of stone. The Jesuits college has a splendid church, and that belonging to the Carmelite nuns is likewise very magnificent. The palace of prince Radzivil is a very large structure, and that of the Sapiehan family is a superb edifice: both of them stand in the market-place, which, together with the castle-street, and the area before the palace, are clean and well paved; but the other streets are generally dirty. In 1673, it was enacted that for the future, every third general diet should be held here, and during the session, the concourse of people has been so great, that four apartments with the stables adjoining to them, have been let for two hundred and sixty ducats a month. A provincial diet, and a court of judicature, are also held in this city.

In treating of Lithuanian Russia, we shall begin with the province of Polesia, which contains several large mo-

raffes, that resemble so many extensive lakes. The principal towns in this palatinate are,

Brzesk, which is a strong, but not a very large town, situated on the river Bug, and has a castle built on a rock, near it is a royal palace with a fine garden. In this town is a famous synagogue, to which the Jews resort from all the countries of Europe, both on account of study and preferment among their own people. A provincial diet is held in this town, and a Greek bishop resides here.

Pinsk is a large, handsome trading town on the river Pina, situated in the midst of extensive morasses, and inhabited not only by the Jews, who have a school here, but also by people of many other religions, especially by the Greeks, who have a bishop here. The leather dressed in this town, after the Russian manner, is esteemed the best in the whole kingdom. A provincial diet is held here.

Under Lithuanian Russia is included Black Russia, called by the Poles Rus Czarna, which includes the palatinate of Novogrodec, and contains four districts, the principal place of which is,

Novogrodec, a town situated on a hill, in which are several Popish and Russian convents, with a college of Jesuits. It has a provincial diet, and an inferior court of judicature; and an high tribunal, after the model of that of Wilna, is held alternately here, and at Minsk, which continues sitting five months every year.

In White Russia, called by the Poles Rus Biala, are four palatinates, the most considerable places in which are,

Minsk, which is seated on the river Swislocz, in the palatinate of Minsk, and has two castles. A provincial diet is held here, besides a high tribunal once in two years. This town was taken by the Russians in 1656.

Mohilow, in the palatinate of Mscislaw, is a handsome commercial town on the river Nieper, and the inhabitants carry on a considerable trade with the Russians. In 1654 Mohilow was taken by the Russians; and tho' it was invested by the Poles in 1660, they were obliged to raise the siege. It was, however, taken from the Russians in 1662 by the inhabitants, who sent off part of the garrison by stratagem, and then made the rest prisoners of war.

Poloc, a fortified town on the river Dzwina, and in the palatinate of Poloc. It has two strong castles, and carries on a considerable trade. In this town the Jesuits have a college, and the Greeks an academy for the study of philosophy. A popish Greek bishop also resides here. In this town are likewise held a provincial diet and a court of judicature. In 1563 Poloc was taken by the Russians, but in 1579 was retaken by the Poles.

We now come to the Livonian Palatinate, called by the Poles Woiewodztwo Inflantkie. This country was a part of Livonia, and is also termed the palatinate of Wend. The Poles, on their delivering up Livonia to Sweden, by the treaty of Oliva, reserved this part, which has a bishop, a palatine, and a castellan, and sends six deputies to the general diet. It has also five or six small towns.

S E C T. XII.

Of SAMOGITIA.

Its Situation, Extent, Soil, and Produce. Its History, and the Manners of the present Inhabitants.

SAMOGITIA called by the Poles Zmuyds, or Xiestwo Zmudskie, is bounded on the north by Courland, on the east by Lithuania, on the south by Regal Prussia, and on the west by the Baltic sea, it being about a hundred and seventy-five miles in length, and about a hundred and twenty-five in breadth; but this is only to be understood of its longest and broadest part, the two extremities being much contracted.

Great part of the country has a marshy soil, and abounds with rivers and lakes, which at some seasons overflow the land. Here are also inaccessible mountains; the country is much over-run with woods, in which the inhabitants find great quantities of honey; for it is said that almost every tree has a swarm of bees; and their

wax is whiter and purer than either that of Lithuania or Ruffia. We are told, that though the arable land is very stiff, the inhabitants use none but wooden plough-shares; because one of their starostas, introducing iron shares, and the season afterwards proving less kindly than usual, they had the weakness to attribute the cause solely to this change; upon which he was forced to let them return to the use of the wooden plough-shares, for fear the prohibition should cause an insurrection. Samogitia abounds with cattle, and has a breed of horses, which, though small, are sprightly, swift, and hardy.

This country antiently belonged to Lithuania; but in the year 1404, was ceded to the knights of the Teutonic order: about four years after, it was taken from them by Uladisslaus Jagello, king of Poland; after whose death it returned again to them; but in 1525, when Albert of Brandenburg was made hereditary duke of Prussia, it returned to the crown of Poland. The Christian religion had been introduced for some time, and in 1413, it was made a bishop's see.

The peasants of this country differ but little from those of Lithuania; but are not so laborious, and consequently enjoy less plenty. Many of them, instead of bread, eat turneps, which grow wild, and are of a prodigious size. They are robust, bold, and nimble; and it is not uncommon for people to live a hundred or a hundred and twenty years of age.

The peasants live in cottages, for the most part near lakes and rivers, and these are covered with thatch or boards. They are low, and of an oblong square, with a hearth in the middle; their furniture is but mean, and they have only one room for themselves and their cattle. Those in good circumstances drink out of horn cups, and eat out of wooden platters. However, most of the inhabitants differ but little in their manners, habit, or language, from the Lithuanians.

There are about twenty-eight towns in Samogitia; but all of them are small and ill built; among these is Mednicki, where the bishop of Samogitia resides, and Rosienie, where the provincial diet and a court of judicature are held.

S E C T. XIII.

Of C O U R L A N D.

Of its Situation and Extent, Soil, Produce, and Rivers. Of the Inhabitants of Courland, and the Privileges of the Nobility. A general History of Courland. Its Arms, Officers of State, and Courts of Judicature. The Division of the Country, and a Description of the principal Towns in each.

THE dutchy of Courland, which is dependant and under the protection of Poland, is bounded on the west by the Baltic, on the north by the gulph of Riga and Livonia, towards the east by Lithuania Proper, and by Samogitia towards the south. It extends fifty German miles in length, and in some places twenty, and in others hardly ten German miles in breadth; but towards the south-west it gradually terminates in a cape or point of land.

The soil, except in a few districts, is heavy, fat, and clayey, and the country abounds in woods and swamps: hence the roads of Courland are remarkably bad. In spring and autumn the meadows and low grounds are under water; but this only serves to improve the land. Some skilful farmers have drained several of the fenny parts of Courland, and converted them into what they call staungens; that is, land which is sown three years successively with summer seed, and then left uncultivated for the like term. Courland, however, contains good arable land and fine pastures, and produces great quantities of excellent flax. Here is also plenty of sea-fish, and the woods abound with elks, bears, and wolves. Courland has also its mines of iron ore and other minerals, its quarries of stone, chalk, and stucco, and its mineral springs. Amber is likewise found on the coast.

The principal rivers in this country are the Windau, which rises in Samogitia, and discharges itself into the Baltic near the town of Windau. The Aa, which has

also its source in Samogitia, and empties itself into the gulph of Riga. The small rivers are the Anger, the Abau, the Berse, the Bartau, the Mussa, &c.

The inhabitants of Courland consist of Germans and Lettonians; but the latter are not only the tenants and vassals of the former, but in a manner their slaves. Hence there are two languages usually spoken in Courland, the German and the Lettonian.

The reformation, or Lutheran religion, took place in this dutchy so early as the year 1522, and in 1532 Courland joined with Riga in a particular religious league; so that when this country fell under the dominion of Poland, all the inhabitants were Lutherans, and they had no papists amongst them. But the misunderstandings which afterwards happened between the dukes and nobles of Courland occasioned several orders to be issued by the court of Poland, and judiciary commissions to be deputed from thence, by which means a fatal gap was opened, by which popery entered. The Roman catholics were at first only permitted to have churches in this country; but they soon raised themselves to a level with the Lutherans. In 1717 and 1727 they received some additional privileges, and several of the nobility who had embraced the doctrines of popery exerting their zeal, in order to introduce it into the churches within their jurisdictions, greatly contributed to its spreading over the country. The marriages of the dukes of Courland with princesses who were Calvinists, also introduced that religion into the dutchy; but the Calvinists are excluded from all public employments.

The nobility of Courland enjoy great privileges, and the old nobility are carefully distinguished from the new; and by an antient law, which has been frequently confirmed, the former alone are capable of filling posts of honour. The noblemen of Courland generally embrace a military life. They enjoy in Poland the same privileges as the natives, and a Polish nobleman has the same indulgence in Courland. However, neither of them enjoy that privilege till they are settled in those countries; and indeed a Courlandish nobleman at present seldom holds any eminent post in Poland, except those of the law, unless he be a papist. The nobility of Courland have no seat in the general diet of Poland.

A noble Courlander is proprietor of all the mines discovered in his estate: he is not to be taken into custody, or his effects confiscated, till he has been previously summoned and legally convicted before a court of judicature: his house is an asylum, from which no person can forcibly be taken: his tenants, vassals, and domestics are exempted from paying any toll, custom, or excise; and no soldiers are to be quartered on the estate of a Courlander. No new created nobleman is qualified to hold a post of honour, or to be a magistrate, till the third generation; nor can he be sent as an envoy, unless he has distinguished himself in the service of his country, or is recommended by some of the antient noble families.

The nobility, among other privileges, have an unlimited power over their vassals, which extends even to life and death; but before they can punish a vassal with death, they are obliged to hold a regular court, under the penalty of paying a hundred florins; each florin equal to fourteen-pence sterling. Hence the respect paid by the peasants to their lords rises almost to adoration, and whatever these require from them they are obliged to give up, and immediately obey their commands without murmuring. The nobility are all on a level, and have, in conjunction with the duke, the patronage of the parish churches; the duke being patron of some, and the nobility of the others. In war-time they appear on horseback, according to the service they owe the duke as his vassal: but when such a general military appearance is required, the duke is obliged to march at their head. They indeed choose their own colonels and other officers; but these are all under the duke's command. They are, however, not obliged to march beyond the frontiers of Courland, except the duke voluntarily agrees to pass beyond those boundaries.

Courland antiently belonged to Livonia, and both were conquered by the knights of the Teutonic order, who kept them till the year 1561, about which time the

Russians

Russians invaded the country; but the order being then much declined from its former power and greatness, Gothard Ketler, the last grand master, gave up Livonia to the king of Poland, as great duke of Lithuania; and, in return, Courland and Semigallia were erected into a temporal dutchy, and Ketler was invested with it as an hereditary fief.

In the beginning of the eighteenth century Courland was harrassed both by the Swedes and the Russians; but in 1710 Frederic William, the sixth duke, married Anne a princess of Russia, who, after his decease, remained in possession of the sovereignty, under the protection of her uncle the czar Peter I. though Ferdinand, brother to the late duke's father, to whom the succession belonged, was still living.

Ferdinand and the nobility were at variance, less on account of his changing his religion, than for his generally living out of the dutchy, and his being desirous of holding the reins of sovereignty, though absent. This put the Polish state on contriving the means of incorporating Courland with the kingdom of Poland, on the demise of duke Ferdinand, and of dividing it into palatinates. This project filled the noble Courlanders with such apprehensions for their religion and liberties, that, notwithstanding a royal inhibition was issued out, they held an extraordinary diet at Mittau in June, 1726, in which the succession, on the decease of Ferdinand, was settled on count Maurice of Saxony, as natural son to the king of Poland, and his male heirs. This election was opposed both by duke Ferdinand and the Poles, who voted it null and void, and by a new law confirmed the intended union of this country with Poland. The patriots of Courland strenuously protested against this encroachment on their liberties, and maintained, that the states of the dutchy derived from their ancestors the right of electing their dukes: a right which they had never forfeited. At length the princess Anne Iwanowna ascending the throne of Russia, signified to the court of Poland, that she could never consent to that dutchy being absolutely incorporated with that kingdom, but would protect it in its right to remain as a fief of the republic, under its own dukes. To this Poland at length consented, and in 1736 it was agreed, that on the failure of the Ketler line in duke Ferdinand, the dutchy of Courland should have its own dukes by the free election of the states.

On the decease of Ferdinand in the following year, the states, at the recommendation of the empress of Russia, chose for their duke John Ernest Biron, count of the holy Roman empire, and high chamberlain to her czarish majesty, who in 1739 was invested duke in the person of his envoy, or representative. This prince's dignity was, however, but of short duration; for in 1740, the czarina Anne caused him and his family to be taken into custody, and sent them into exile in 1741; upon which the states of Courland chose for their duke Lewis Ernest, duke of Brunswick-Wolfenbuttle, brother to the regent of Russia's husband; but this election not being compassed without force, it has not yet taken its proper effect.

Indeed Ernest John is still considered as duke of Courland, notwithstanding his being deprived of the exercise of his power. However, the ducal chair having been declared vacant by the high council, all public instruments are issued out in the name of his Polish majesty, who at present personates the duke, and are signed by the four lords of the regency who have the disposal of public employments. Mean while the court of Russia keeps six thousand men in this country, and also a plenipotentiary, who resides at Mittau; but his only employment is to take care of the revenues, and those lands which the duke had either purchased or redeemed from the nobles to whom they had been mortgaged, alledging, that this was done by the duke's embezzling the money belonging to that crown; and accordingly near a hundred thousand rixdollars are annually paid out of the ducal revenues into the hands of the Russian minister.

The revenues of the duke of Courland are said to be very considerable; for the ducal domains make above a third part of the whole country: if to these be added its convenient situation for a maritime trade, the duke of

Courland, when in the full possession of that office, cannot fail of being very rich. A judgment may be formed of the wealth of this dutchy, if we consider that James duke of Courland was master of forty-four ships of war and seventy-five merchant ships, and endeavoured to settle colonies even in America.

The arms of Courland are, quarterly, the first and fourth argent, a lion gules, crowned or, for Courland; the second and third azure, a demi-elk crowned proper, for Semigallia. In the center is a small escutcheon party per pale, reserved for the particular coat of the ducal family. The arms are within a ducal mantle of purple and ermine, and supported by two lions crowned or, and the whole surmounted with a ducal coronet.

By virtue of a form of government for the dutchies of Courland and Semigallia, drawn up in 1670, by a commission from the king of Poland, the following officers of state are appointed in Courland:

Four high counsellors; viz. a steward, a chancellor, a burgrave, and a marshal.

Two civilians, who are the duke's council. The high council, during the absence, minority, sickness, or death of the duke, administer justice, issue orders, pass decrees, and transact all other state affairs in his name.

Four superior prefects, two for Semigallia, and two for Courland, who administer justice both to the nobles and commonalty within their respective jurisdictions. From these the vacancies in the high council are filled up, and under each of them are two inferior prefects, who upon occasion are promoted by the duke to the office of superior prefects. From the court of the latter appeals lie to the ducal supreme court, where the duke assists in person, together with the high council. This is held twice a year, and from it, in causes amounting to above six hundred florins, an appeal lies to the king of Poland, except in cases of wilful murder, burning of houses, robbery, rapes, or open violence. Ecclesiastical causes are tried by the chancellor, assisted by the superintendant and four provosts. If any disputes happen to rise between the duke and nobility, they are decided only by the king in person.

The administration of justice in the towns belongs either to the magistrate, or the prefect of the district in which the defendant resides, according to the nature of the cause; and the second and last hearing is at the ducal court. Suits relating to debts are heard by officers called executoriales.

Every two years a diet is held at Mittau, to which every parish sends a representative with full powers.

Courland consists of three divisions, Courland Proper, Semigallia, and the district of Pilten. The last has a particular form of government; but the two first are divided into prefectures, and these into parishes. There are here large and small towns, seats, castles, farm-houses, and single houses of accommodation; but no villages. The number of towns, castles, seats, &c. is about nine hundred.

In Courland Proper the most considerable place is,

Libau, which is a ducal city, and a port of good trade on the Baltic. It is situated in fifty-six degrees fifty-four minutes north latitude, and in twenty-one degrees twenty-six minutes east longitude. It is of a middling size, and consists entirely of wooden houses, only one story high; but there is a Lutheran church built in the modern taste, with a flat roof and ballustrade. The papists are allowed a church at Libau, and there is a protestant school. As the harbour wants sufficient depth of water for ships of burthen, they are unloaded in the road; but since duke Ernest John caused it to be cleared in 1737, and prevented a future accumulation of mud and sand by a water-work, it is rendered very commodious for light vessels. Above one hundred and fifty ships annually arrive in this port, in order to load with hemp, linseed, &c. A court of admiralty is also held here, and near the town is a fresh water lake, called the lake of Libau.

The second principal division is that of Semigallia or Semgallen, which includes the prefectures of Mittau and Seelburg, the most considerable places in which are,

Mittau, the capital of Courland, and the residence of the duke, which is situated in fifty-six degrees forty-

four minutes north latitude, and in twenty-three degrees fifty-one minutes east longitude. This town stands on the river Aa, and is very extensive; but within its circuit are many gardens and open places. The houses have for the most part nothing very elegant to attract the eye, and both the walls and moats of the town are decayed. It is, however, pretty well inhabited. It has two Lutheran churches, a beautiful church belonging to the Calvinists, and a popish church. The school, though it is the principal in the whole country, is far from being in a flourishing condition. This city is the seat of the regency and superintendant of both dutchies.

At a small distance from the city stands a palace, begun by the unfortunate duke Ernest John; but only the front of one wing is compleated, and the rest hardly carried up as high as the roof. It is built in a most delightful situation, on the same spot where the old castle stood, and is two stories high. The palace, according to the plan from which it is built, would probably have been one of the most magnificent structures in Europe, had not the building of it been interrupted by the disgrace and exile of its unhappy founder. It is at present a desolate place, and is gradually falling to decay. The cieling and floors of some of the apartments were of most excellent workmanship; but these have been taken away, and the rooms converted into granaries. Under one wing of this building is a handsome vault, in which are deposited the remains of the deceased dukes, most of which lie in coffins of fine pewter curiously decorated; and among the princes lies a peasant in a pewter coffin, on account of his heroic fidelity, in voluntarily suffering himself to be shot instead of duke Ferdinand, by some noblemen who had conspired against that prince's life.

The next division of Courland is that of Pilten, which lies in Courland properly so called, and derives its name from the ancient castle or palace of Pilten, built by Waldemar II. king of Denmark, about the year 1220, when he founded a bishop's see in this country, for the more effectual conversion of its Pagan inhabitants.

This district afterwards successively belonged to the Germans, then again to the king of Denmark, the duke of Courland, and to Poland; and by virtue of the instrument of regency drawn up for this district in the year 1717, the government is lodged in seven Polish senators or counsellors, from whom an appeal lies to the king. The bishop of Samogitia also styles himself bishop of Pilten.

The most remarkable part of this district is the promontory of Domesness, which projects northward into the gulf of Livonia. From this cape a sand-bank runs four German miles farther into the sea, half of which lies under water, and cannot be discerned. To the east of this promontory is an unfathomable abyss, which is never observed to be agitated. For the safety of vessels bound to Livonia, two square beacons have been erected on the coast, near Domesness church, opposite to the sand-bank, and facing each other. One of these is twelve fathoms high, and the other eight; and a large fire is kept burning on them from the first of August to the first of January. When the mariners see these fires appear as one in a direct line, they may conclude that they are clear of the extremity of the sand-bank, and consequently out of danger; but if they see both beacons, they are in danger of running upon it.

The district of Pilten contains seven parishes, but no towns worthy of notice. The inhabitants are chiefly of the Lutheran religion.

S E C T. XIV.

Of POLISH PRUSSIA.

Its Situation, Extent, and Produce. Of the Religion and civil Privileges of the People; the Form of the Government. The Divisions of the Country, with an Account of the principal Towns in each, particularly of Dantzic and Thorn.

POLISH or Regal Prussia, which has been added to the general province of Great Poland, is a very different country, inhabited by a different people, who

have their peculiar laws and privileges; and therefore deserves to be separately considered, for the sake of that order and perspicuity which ought ever to accompany works of science.

This country is bounded on the north by part of Pomerania and the Baltic Sea; on the east, by the kingdom of Prussia; on the south, by Great Poland; and on the west, by Great Poland and Pomerania. It is far inferior in extent to the kingdom of Prussia, it being only about sixty miles in length, and fifty-one in its greatest breadth; but in some places the latter does not exceed eighteen miles.

The face of this country is diversified with mountains, woods, and lakes; but in the south part there is little pasture ground, and consequently few cattle. The fisheries are of great advantage to this country, which also yields a vast quantity of honey and wax. The woods abound with wild boars, roe-bucks, and wild fowl, and a good deal of lime is also burnt in some parts of the country.

The most remarkable heaths in Polish Prussia are those of Skal, Masura, Nicholait, and the desert of Johannesberg, which is seven German miles in length, and four in breadth.

It is inhabited partly by Poles, and partly by Germans. The Reformation was introduced here early in the sixteenth century, and in a few years the professors of the Lutheran religion increased so fast, that their number in the principal cities and towns far exceeded that of the Papists, and they had almost as great a superiority in the smaller towns and villages. But succeeding times have introduced considerable alterations. The kings of Poland have, indeed, allowed the inhabitants the free exercise of the Lutheran religion in the cities of Prussia; but there are at present only few towns in which the Lutherans have churches, and in other towns they have been compelled to give them up to the Papists. Besides, the Protestants are continually oppressed, and promises of preferment and other means are too successfully employed, in order to seduce the Prussian nobility from the Lutheran church.

Polish Prussia is a distinct political body or state, that has nothing in common with Poland, except its having the same sovereign, and being connected with that crown by a perpetual alliance. For when the inhabitants put themselves under the protection of king Casimir IV. in 1466, it was expressly stipulated, that the duchy of Prussia should have nothing to do with the republic of Poland; but that the king alone should personally order and determine all matters relating to the former; and for that purpose should come among them, and summon general diets. Hence this state enjoys the same right as Poland and Lithuania, of voting at the election of a king, who after his coronation is obliged to swear, that he will maintain the Prussians in their rights and privileges; and when this is done, they pay homage to the new sovereign.

In matters of a public nature, the king can determine nothing without the concurrence of the states, who are divided into spiritual and temporal members, the latter consisting of nobles and burghers. Of these the senate is at present composed. This council consists, first, of the bishops of Ermland and Culm. The former is the president and chief among the nobility, and is not under any subordination to the archbishop of Gnesna; but holds immediately of the pope. His diocese, in which he has the supreme authority both in civil and ecclesiastical causes, is of very large extent. Its revenues are divided into three parts, one of which belongs to the chapter; but the other two, which are computed at sixty-four thousand dollars, are assigned for the episcopal table. The diocese of the bishop of Culm is not near so extensive, and consequently the revenue is much inferior to that of the bishop of Ermland. The bishop of Culm is a suffragan to the archbishop of Gnesna, and the king absolutely disposes of that bishopric without calling a chapter.

The other members of the council are three palatinates, who are of equal dignity with those of Poland; three castellans, who are not invested with any particular office or employment, but on a general summons

of the nobility, may be looked upon as the lieutenants of the palatinates. Three vice-treasurers, who have only a bare title; but as they are counsellors of state, they take place of the rest of the nobility. Two counsellors from each of the three great cities, Dantzic, Thorn, and Elbing, and each of these representatives have a vote.

All these state counsellors, according to the laws of the country, ought to be native Prussians; but they have seldom these qualifications. They are nominated by the king of Poland, and take a particular oath at their admission. The bishop of Ermland sits as president in the Prussian diet; but in his absence, his place is supplied by the principal person among the nobility who are present. These members are stiled the two states of the dutchy of Prussia, and royal counsellors: they may likewise be termed the superior states, to distinguish them from the inferior, composed of the lower nobility, and the deputies of the small towns. Formerly king Casimir IV. engaged for himself and successors, not to determine any affair of consequence, without the previous concurrence of the states of Prussia. This was the original of these Prussian diets, which had formerly no connection with those of Poland. But in the year 1569, part of the senate, or council of Prussia, was united with the senate of Poland, and the states of the former were compelled to appear at the general diet of the kingdom. From that time the political constitution of Prussia has been much changed; but it is not entirely interwoven with that of Poland, and still enjoys particular rights and privileges.

At summoning the general Prussian diet, which is alternately held at Marienburg and Graudenz, the king specifies the time of holding the lesser diets, where the representatives of the former are chosen, and receive their instructions. These provincial diets are held in every palatinate, and the happy conclusion of them is a presage of the prosperous issue of the general diet; for if only one of these assemblies rises abruptly, the general diet is seldom expected to assemble. The number of representatives for every palatinate is not fixed, but they have lately been more numerous than formerly. The instructions given them are in the Polish tongue, and during the session of the diet their expences are defrayed.

The Prussians, besides their own general diet, assist at the general diet of Poland; but they agree to the taxes to be imposed on them, only in their own general diet, and not in that of Poland.

The Prussians had formerly their own coin, which is now reduced to the standard of the Polish money. However, the three principal cities of Prussia have still the privilege of coining gold and silver pieces, impressed with the king's head on one side, and their respective arms on the reverse; which, after receiving the royal sanction, pass as the current money of Prussia.

Besides the counsellors of state, already mentioned, there are several other public officers in Prussia, as the treasurer, who is the principal, and the only one that has an annual appointment: the sword-bearer, who has only the bare title: the standard-bearer, who bears the standard of the province, when all the nobility take the field; and seven judges, with their assistants.

With respect to the towns of Prussia, it is worthy of notice that they are divided into the three great cities, Dantzic, Thorn, and Elbing, and twenty-seven royal towns, besides those that belong to the bishops of Ermland and Culm. An association was formed among these small towns under the government of the knights of the Teutonic order. By this union, which still continues, they are to unite in behalf of their common privileges; to consult their interest as a community in their particular assemblies; and to recommend their common concerns in the general diet of Prussia to the representatives of the great cities. Marienburg, which is the most considerable among these towns, has the directory, and this, with Graudenz, Dirshau, Stargard, and Konitz, are called the plenipotentiary towns; for, besides their own affairs, they are charged with those of all the other towns, which they lay before the directory, and the latter represent them to the deputies of the great cities.

These small towns are at present far from being in a flourishing condition. From the sentences of their magistrates an appeal lies to the starostas, and from the latter to the king.

Polish Prussia consists of four provinces; we shall begin with that of Pomerellia, or Little Pomerania.

Pomerellia was antiently a part of the dutchy of Pomerania; but at last fell under the dominion of Poland. This palatinate contains five circles, and has four provincial judges; the most remarkable places in this province are,

Dantzic, called by the Poles Gdantzk, a celebrated commercial city and fortress, situated on the Vistula, near five miles from the Baltic, in fifty-three degrees thirty-eight minutes north latitude, and in eighteen degrees thirty-five minutes east longitude. The small rivers called the Radaune and the Motlau run through the city; the latter dividing into two channels, which run between the Old and New Town, and afterwards unite again below the city, and, with the Radaune, fall into the Vistula. It is a large, beautiful, and populous city, built after the antient manner of the Hanse-towns. The houses are generally five stories high, which make the streets appear the narrower, especially as the entrance into the houses is by four or five stone steps, and a balcony, which make a projection of ten or twelve feet. These houses are kept clean after the manner of the Dutch, though with less nicety. Many of the streets are planted with chefnut-trees about thirty feet high, which afford an agreeable shelter.

This city has a beautiful harbour, and the inhabitants, who are remarkably civil and obliging to strangers, carry on a considerable trade, especially in corn. The ships belonging to this port are very numerous, and the privileges of this city are of great importance. As it is one of the three great cities, it sends representatives to the Prussian senate or council of state, who have likewise a seat in the general diet of Poland, and vote at the election of a king. The Dantzickers have also the privilege of coining money, gathering amber, &c.

In this city are twelve Lutheran churches, exclusive of those in the house of correction and in the alms-houses, two Calvinistical churches, and one Popish church, with a college of Jesuits. The cathedral, which is a large Lutheran church dedicated to the Virgin Mary, is the most magnificent, and the principal church in Dantzic. Mr. Hanway observes, that this is an antient structure that has not been much changed by the establishment of the protestant religion of this city: for it was agreed by treaties to leave the crucifixes, images, and pictures, as in the times of popery. They shew a very curious piece of painting on wood, of the resurrection, by Van Eyck. It is much admired, particularly for the hands and faces, and is said to be one of the first performances in oil colours; yet is so perfect, and delicate, as to bear the nicest examination. But this church, upon every frivolous pretence, is subject to the impositions of the Popish bishop. The first preacher, or minister of this church, is called senior ministerii, the rest are equal as to dignity, and two of them must always be doctors in divinity. There is a Lutheran academy in the Grey Friars convent, in which are seven professors and one teacher of the Polish language. In this convent is also the city library.

The other public buildings are the exchange, the council-houses in the Old and New Town, the public weigh-house, the arsenal, which contains a good collection of arms, but many of them are old and useless; they have a hundred and fifty large brass cannon, some of which are said to weigh fifteen thousand pounds. They have also a fine mill erected on the river Radune, which has eighteen wheels, is the largest in all the city, and is said to have brought in a ducat every hour to the proprietors.

This city was antiently the principal of the Hanse-towns, it being one of the first that entered into the Hanseatic association. The German is almost the only language spoken here, the Polish being little used by the inhabitants.

This city has its own garrison, and the fortifications make a good appearance, especially towards the south

and

and west; those parts of the town being surrounded with eminences, some of which rise higher than the towers of the city.

According to the bills of mortality eighteen hundred and forty-six persons died in this city in 1752. In the same year twelve hundred and eighty-eight Polish vessels, small and great, from the Vistula, and a thousand and fourteen ships from the sea, arrived in this port; and fifty-eight thousand and sixty bushels of corn were brought into this city for exportation. Indeed the most considerable branch of the trade of Dantzic is that of corn, which is brought by the Polanders, in large barks of about fifty tons burthen, down the Vistula. In plentiful years these barks annually amount to about sixteen hundred. As these cargoes are often exposed to the weather, it is customary to spread their sails on the banks of the river, and to dry their corn upon them. They also export bees-wax to the annual amount of near a thousand schippounds; besides narrow linens, sackings, pot-ash, pearl-ash, pipe-staves, and oak-plank.

It appears from antient records, that Dantzic was a large commercial city so early as the year 997. The New Town was founded by the Teutonic knights in the year 1311, and was first encompassed with a wall and moat in 1343. Dantzic shook off the yoke of those knights in 1454, and the inhabitants, upon certain conditions, submitted to Casimir, king of Poland, who, among other privileges, granted them the right of coining their own money. Afterwards they refused to do homage to Stephen, king of Poland, without the previous confirmation of their rights and privileges; upon which the city was put under the ban, and besieged by that prince; but the affair was accommodated, and, on their publicly acknowledging their error, and paying a large fine, the king received them into favour, confirmed their privileges, and granted them the free exercise of the Lutheran religion. In 1734, Stanislaus, king of Poland, took refuge here, which occasioned a hot siege and bombardment from the Russians and Saxons; but Stanislaus making his escape, Dantzic submitted to Augustus III. as its rightful sovereign.

The city is in the diocese of Cujavia, and the inhabitants pay the popish bishop all the regard consistent with the difference of their religion, and the privilege and immunities of the city. Without the walls of Dantzic lie the following places within its jurisdiction.

The Dantziger Werder, or island, which is surrounded by the Vistula, the Motlau, and the morasses caused by these rivers, and contains about fourteen hundred hides of land, and about thirty-three villages. It is entirely under the government of the magistrates of Dantzic; and the senior burgomaster, and two of the senators, are superintendants of it. There are twelve church-villages in this island, and among them is one Calvinist church and two chapels.

The Frische Nehrung is a long narrow slip of land, extending between the sea and the harbour. It contains five villages that have churches; but the most remarkable place on this island is a fort called Munde, which is very strong, and has a church and a commodious harbour. The Hohe, on which are eight church villages; and the little town of Hela, likewise belongs to Dantzic, and is on a point of land which projects with a curve into the Baltic, forming the Pantzkerwic-bay, where ships usually cast anchor.

About a German mile from Dantzic is Oliva, a celebrated convent, that has been frequently consumed by fire. It is at present inhabited by about fifty Cistercian monks. The inside of the church is extremely splendid, particularly the high altar and the pulpit, which are finely gilt and extremely beautiful. It has forty altars, all embellished with the richest ornaments, and several chapels, among which that of the blessed Virgin is the most magnificent. The remains of the founder of the monastery, and his sons, are deposited under a marble tomb-stone in the choir, and the walls are ornamented with the statues of the principal benefactors to this religious house. Near the entrance of the church is a marble table in the wall, in commemoration of the treaty of Oliva concluded in this monastery between the Poles

and Swedes in 1660. The dispensary belonging to the convent is elegant and well contrived. This monastery has the privilege of gathering amber on the sea coast. Round this structure a pretty village has been gradually built. There are several other small towns in the district belonging to Dantzic.

The next province of Polish Prussia is that of Culmerland, or the palatinate of Culm. This province has a palatine, who is the first of those belonging to Prussia, a castellan, a vice-treasurer, a sword-bearer, a judge, and eight starosties. The principal places in this palatinate are,

Culm, or Chelmino, the capital of the province, which stands on an eminence on the banks of the Vistula, in fifty-three degrees twenty minutes north latitude, and in nineteen degrees twenty minutes east longitude. This city was founded in 1239, and bequeathed by one of the dukes of Masovia, to the knights of the Teutonic order. The inhabitants afterwards withdrew themselves from their obedience, and submitted to Poland. While the Teutonic knights had the sovereignty of Culm, the high tribunal of Prussia was held in this city, and the Culmean law became in such reputation, that there were few places in Prussia or Masovia, where it was not received. The bishopric of Culm is the most antient see in Polish Prussia, and the college or chapter consists of only four canons, who are chosen by the bishop, and the rest of the chapter. Culm is a large city, though but thinly inhabited, and was formerly one of the Hanse towns. It is at present subject to the bishop.

Thorn, the chief of the three great cities of Polish Prussia, stands on the Vistula, seventy-two miles south of Dantzic, in fifty-two degrees forty-six minutes north latitude, and in nineteen degrees fifteen minutes east longitude. This city was founded by Herman Balck, first grand master of the Teutonic order, who in 1231, built the castle of Thorn, and in the following year laid the foundation of the town; but in 1235, the building of it was discontinued, on account of its inconvenient situation, and the city was built about four miles and a half up the river, where the city now stands. It is supposed to have been called Thorn, because the knights, by building it, opened to themselves a thor, or door, into Russia. Thus the seal of the city presents a gate thrown open. Thorn soon after its being built became distinguished above the other towns of Prussia by its enjoying several valuable privileges; but when the Teutonic knights made a very ill use of their power throughout all Prussia, Thorn was the first city that formed the noble scheme of shaking off their oppressive yoke. The inhabitants having concerted an agreement with the other towns in the year 1454, made themselves masters of the castle, and demolished it; and having expelled the Teutonic knights by force of arms, the confederates put themselves under the protection of Casimir the Great, king of Poland; but their rights, privileges, and immunities were to remain entire. They were to honour his Polish majesty as their sovereign; but without any farther connection with Poland than a close harmony and alliance, by which they engaged to have the same allies and enemies, to assist each other on all occasions, and reciprocally to promote the welfare and prosperity of both parties.

The privileges granted to these three cities in common were as follows: they were declared free, and were to be governed by their own magistrates, consisting of the council, the chief persons of which are the burgrave and president, the judges, and the representatives of the burghers. The members of the council were to be stiled noble; they were allowed to hold a supreme court of judicature, and in criminal cases to punish capitally even those who were not inhabitants of the city if they were taken in the fact; to have their own garrison; to coin money, and to have their law-suits decided only in Prussia. They were to pay no other customs in Poland but those usually demanded at the first barrier on the frontiers. Lastly, they were to be members of the state-council of Polish Prussia, and to have a seat and vote in the Polish diet, and at the election of a king. The third jubilee of this event was commemorated with great rejoicings

rejoicings in the schools of all the three great cities in February 1754, when Thorn and Dantzic caused medals to be struck on the occasion.

In this city the records of Polish Prussia are kept; it has ten gates, and is divided into the Old and New Town, each of which had formerly its respective council, magistracy, and police; but in 1454 they were incorporated into one city. They are, however, separated by a wall and moat within the town, but on the outside are defended in common by a double wall and moats. This is esteemed the handsomest city in Polish Prussia, its streets being broad and regular, and for the most part planted with rows of trees: the houses are also remarkable for their elegant appearance and cleanliness. The wooden bridge over the Vistula in this city may be justly esteemed the longest, the most extraordinary, and expensive bridge in Europe, the city being obliged to expend great sums in keeping it in repair. It properly consists of two bridges, the island of Bazar dividing it in the middle. That part of it next to Thorn is called the German bridge, and the channel over which it lies is esteemed the German Vistula; but the other part is distinguished by the name of the Polish bridge, it lying over the channel called the Polish Vistula. As the river grows continually wider, the bridge must necessarily be lengthened; so that at present it takes up half an hour to walk over it from one bank of the river to the other. It is also the most singular on account of the quick-sand into which the piles are driven, which occasions the whole bridge to shake and totter whenever any carriages or horses are upon it, or even when it is passed by a considerable number of foot-passengers: a stranger, who is unacquainted with its construction, apprehends himself in great danger in passing over it. The ice on the Vistula, which is frequently two or three feet thick, and the rapidity of the current, carry away every year at least one-third of it. Hence some idea may be formed of the vast expence the city of Thorn is at in repairing these annual damages; for the Poles, notwithstanding the heavy loads they bring over it, pay no part of the expence.

Thorn has its own garrison, which generally consists of only one company. The soap, gingerbread, &c. of this city are every where in great request; and accordingly great quantities of them are exported. The asparagus that grows wild in some of the city lands is not inferior to that cultivated in the gardens of other countries.

The inhabitants of Thorn are commended by all foreigners for their civility and politeness, in which they exceed those of every other town in Prussia. It is also observable, that the German tongue is spoken here in the greatest purity; so that even the inhabitants of Upper Saxony acknowledge that they are at present equalled, if not excelled, in this particular by the commonalty and burghers of Thorn. But what is still more remarkable is, that not only the German but even the Polish language, which is necessary for carrying on trade, is also spoken here in such perfection, that the Poles send their children hither, merely to learn their native tongue in its utmost purity and elegance.

The inhabitants of Thorn embraced the reformation very early. In the year 1557, king Sigismund Augustus granted them considerable privileges. The Lutherans were allowed St. John's church and St. Mary's in the Old Town, and St. James's in the New, besides St. George's and St. Catharine's in the suburbs. On the other hand, the Papists were allowed a chapel near St. John's, and the church of St. Laurence in the suburbs. The Dominicans retained their church of St. Nicholas, and their convent in the New Town; and the Benedictine nuns their church of the Holy Ghost, and their nunnery, which stands on the Vistula. In the above churches the Lutherans administered the sacrament of the Lord's Supper in both kinds, and the council are empowered to nominate the ministers of their religion. But in the year 1593 St. John's church was transferred to the papists, and afterwards the Jesuits built a college at Thorn, which has always been much frequented by strangers, and has occasioned many calamities to the city, particularly in the year 1724. The city has, however, maintained its right of patronage of the above church,

and alternately with the king of Poland nominates the Romish priest who officiates in it. In this church is to be seen the epitaph of the celebrated astronomer Nicholas Copernicus, who was born in this city. In 1667, St. James's church, in the New Town, with the hospital belonging to it, was taken from the Lutherans, and given to the Benedictine nuns, and they were deprived, in the same unjust manner, of St. Mary's, the only remaining Lutheran church, with the celebrated seminary, which was removed to another edifice, after having flourished there since the year 1568. The Lutherans of the Old Town continued for several years to perform divine service publicly in the exchange, which stands in the market-place; but that edifice was too small for the congregation; for the burghers amount to at least a thousand men, who are all Lutherans, except about thirty persons; on which account they have since the year 1755 built a new church on one side of the market-place. There are four Lutheran churches in the villages belonging to Thorn. In the city are also some Calvinists, who perform their religious worship in a private house. The Jews have likewise a small synagogue in the city. About a German mile from Thorn is a Popish chapel dedicated to St. Barbara, distinguished by many pretended miracles; and an annual procession is made with great solemnity every Whitsun-Tuesday from the city to this chapel, for obtaining public indulgencies.

Among the public edifices of the city, the town-house in the Old Town is worth the notice of the traveller: it stands in the market-place, on every side of which very handsome houses are erected, and forms an elegant quadrangular square structure, built with such magnificence, that for the beauty of its architecture, foreigners give it the preference to most edifices of that kind in Europe.

The exchange, which is also in the market-place, is a superb structure, adorned with towers, and its front embellished with gilded bustoes of the kings of Poland.

The popish churches, both for their spaciousness and ornaments, deserve particular notice, as does the Jesuit's college.

The junkerhof which stands on the bank of the Vistula, and belongs to the exchange, is a delightful place intended for festivity, and the entertainment of the principal merchants and citizens.

The leaning tower, as it is called, is an extraordinary piece of architecture; for as its outside is built obliquely from the ground, it appears as if ready to fall: but on the inside the floors and ceilings are perfectly horizontal, and the walls perpendicular to the horizon.

Graudenz, formerly called Grodec, and in the Polish language Grudziandz, is a handsome town pleasantly situated on an island formed by the river Ossa, which here flows through two channels into the Vistula. The castle stands on an eminence, and within it is a church; there is another in the town, of which the Lutherans were deprived in 1598, on which account they are obliged to perform divine service in the town-house, where they have also a school, and the Jesuits a college. The Prussian diet is held here and at Marienburg alternately.

The next province of Polish Prussia we shall describe is the prefecture of Marienburg, which has a palatine, a vice-treasurer, and a provincial judge. This palatinate contains three werders. A werder is a fen, or morass, surrounded with water, and improved for tillage and habitation. They produce plenty of grass and corn, but have seldom either woods or hills. That called the wood of Elbing is the most considerable in this district. In many parts the only fuel is turf, straw, and stubble; and even where there are woods, they afford little game, except hares, woodcocks, and other wild-fowl, but harbour very fierce wolves. The fresh water in these werders is very good; the air is tolerably healthful; a great number of cattle are bred here, and the horses are much esteemed. The inhabitants of the werders have from time immemorial been free peasants, and are stiled the royal vassals and werderers. Those however who are subject to

the jurisdiction of the cities, are under greater restrictions than the royal peasants who live in the Marienburg werders. They speak the German and Polish languages, and are for the most part Lutherans or Papists; but there are also some Calvinists, and a considerable number of Mennonites, a sort of Baptists.

The principal places in the prefecture of Marienburg are, Marienburg, a well built town, stands on an eminence near the river Nogat, in a pleasant and fertile country, in fifty-four degrees twelve minutes north latitude, and in nineteen degrees twelve minutes east longitude. Here is a handsome church dedicated to the Virgin Mary, from which the town takes its name. The wooden bridge laid over the Nogat is five hundred and thirty-nine feet in length, and is a very great charge to the city; the fund appropriated for building and repairing it not being sufficient for that purpose. In the castle is the treasury, where are kept the revenues of Polish Prussia: the streets of the town are very dirty. Most of the inhabitants are Roman Catholics, and there is but one Lutheran church.

Elbing, a handsome large city, fortified after the ancient manner, stands on a river of the same name, in fifty-four degrees twenty-one minutes north latitude, and nineteen degrees fifteen minutes east longitude. It was built in 1239, and is a place of considerable trade. Between the Old Town and the suburbs, where the storehouses of the merchants are erected, runs the river Elbing; and the Old Town is divided from the New by a wall and moat. The houses are high, narrow in front, and built in the old taste much like those at Dantzic. The streets are also very narrow, occasioned by the balconies which project into them; and before these are receptacles for all the dust and filth thrown out of the houses. Here are ten churches, in which divine service is performed. That of St. Nicholas, which is the largest and handsomest church in Prussia, was given up to the papists in 1616. The Calvinists perform divine service in a large hall, and the Mennonites in a private house in the city; but the school belongs to the Lutherans. This is one of the Hanse-towns, and as it is inhabited by a colony from Lubec, it is governed by the laws of that city; the burghers, however, have their particular rights and privileges. The castle, which was built in 1237, was demolished by the burghers in 1454. The fortifications towards the werder are very slight, but on the opposite side they are in a much better condition; yet it is esteemed one of the strongest towns in Polish Prussia. Some companies of the crown-army of Poland are cantoned in this town, but the burghers keep guard at the gates, and the suburbs have a Prussian garrison.

This city in ecclesiastical matters is under the jurisdiction of the bishop of Ermeland, as far as is consistent with the difference of religion, and without prejudice to the rights and privileges of the city; but in civil affairs it is only subject to the king. In 1703, Elbing fell into the possession of the Swedes, who laid it under contri-

bution; but the Russians took it from them by storm. It was formerly mortgaged to the elector of Brandenburg, as a security for the payment of four hundred thousand rixdollars; but as the elector did not receive the sum stipulated, the king of Prussia took possession of the district belonging to the city, in virtue of the above agreement.

The last province of Polish Prussia which remains to be mentioned is that of Ermeland, which is entirely surrounded by the kingdom of Prussia. This province belongs to no palatinate, but is entirely subject to the bishop and chapter; so that neither the nobility nor the other inhabitants of Ermeland can appeal to any other judicature. Two-thirds of this province belong to the bishop, and the remaining third part to the chapter. Their subjects have recourse to the same courts of judicature as the rest of the Prussians; but they have some particular laws to themselves. They have also a provincial diet, to which the nobility, the burghers, and country judges, together with the freemen, are summoned. Though the Ermelanders do not assist at the Prussian diets, the bishop is always present, and proposes whatever is debated concerning his diocese, particularly in relation to the taxes, according as they have been agreed upon in a provincial meeting held for that purpose, where the Ermelanders seldom dissent from their bishop and the Prussian states.

The most considerable places in Ermeland are,

Braunsberg, a pretty large trading town, situated on the Passarge, at a small distance from its mouth. It was built in 1255, and received its name from Bruno, bishop of Prague. It is divided into the Old and New Town, and is very populous. The celebrated college of the Jesuits in this town was formerly a Franciscan convent; it is now under the jurisdiction of the bishop.

Heilsberg, a beautiful town on the Alle, in which stands an elegant seat belonging to the bishop of Ermeland. There is a college of Jesuits in the town. It is said to be built in 1240, and was destroyed by fire in 1521. Charles XII. king of Sweden, had his headquarters here in 1703.

Kessel, an elegant little town with a castle, has a college of Jesuits, to which the church of the Holy Linden-tree in Brandenburg Prussia belongs. This town is well supplied with provisions, and carries on a good trade.

We might here be expected to conclude this chapter on Poland, by following the example of almost all other geographers, in joining to Regal or Polish Prussia the kingdom of that name; but this new kingdom ought no longer to be considered as a petty dukedom; it ought no longer to be placed on a level with Polish Prussia, and the other states dependent on the republic of Poland; its sovereign has given it a more respectable appearance in the eyes of all Europe: we shall therefore treat of it in a separate chapter.

C H A P. IV.

Of the Kingdom of P R U S S I A.

S E C T. I.

The Situation, Extent, Climate, Produce, Rivers, Lakes, and Bays of the Kingdom of Prussia in general; with a particular Account of the Properties of Amber.

THIS kingdom, which has been generally called Ducal Prussia, and belongs to the house of Brandenburg, is divided from the other dominions of its sovereign by Polish Prussia, and is bounded on the north by Samogitia, on the east by Lithuania, on the south by Poland Proper and Masovia, and on the west by Polish Prussia and the Baltic. Its greatest length from its northern extremity to Soldau is about a hundred and ninety miles, and its breadth from the borders of the great dutchy of Lithuania, near Shirwind, to the western coast of Samland is a hundred and fourteen miles; but in other places it is much narrower.

With respect to the climate and temperature of the air, the two last months of the spring and the two first summer months are temperate, warm, and pleasant, and the weather generally favourable for bringing the fruits of the earth to maturity; but before and after these months the air is cold and piercing: autumn is often wet, and the winter severe. The air is, however, well purified by high winds. As to the distempers which most prevail in Prussia, the inhabitants are more subject to the gout and stone than to the scurvy.

The soil produces great plenty of corn, fruit, excellent herbs, and pasturage. Prussia likewise abounds with flocks and herds, and exceeding fine horses; its chief commodities are buck-wheat, wool, flax, hemp, wax, honey, hops, pit-coal, and pitch.

Prussia also affords plenty of game, as elks, stags, roebucks, white and common hares, and wild boars; and is infested with beasts of prey, as lynxes, bears, wolves, and foxes; but as for the buffaloes that formerly frequented this country, they have been extirpated by the poachers, and wild horses and asses seem to have deserted Prussia.

The woods, particularly those of oak, are said to be greatly diminished, especially in Lesser Lithuania.

Prussian manna is found in the meadows on the top of a kind of grass, and gathered in the morning, while the dew lies upon it. Natangen yields the best sort, and in the greatest plenty.

The beautiful red colour called St. John's blood, is made of the eggs of a small worm, or insect, very common in this country.

Vast quantities of amber are found on the coasts of the Baltic, in Prussia, particularly on the Samland shore. It owes its origin to a sulphureous matter, is pellucid, and generally yellow; but the white sort is esteemed the best. If amber be well rubbed, it attracts light substances; it is also inflammable, and when burnt, its odorous effluvia surpasses those of frankincense or mastic. It likewise yields an acid spirit. That it was once in a fluid state evidently appears from the leaves, minerals, flies, spiders, ants, gnats, worms, frogs, fishes, drops of water, pieces of wood, and grains of sand, that are frequently seen inclosed in it. Dr. Busching observes, that amber is generally found on large trees which are buried under ground in a vitriolic earth, and contain an oily substance; and that hence some are of opinion, that the oil being coagulated by the acidity of the vitriol, becomes the solid body which we call amber. Amber is not only obtained by digging, but is found in the sea, it being washed off the trees by the agitation of the waves in high westerly or north-west winds, and driven on shore. The profits arising from amber belongs to the crown of Prussia, and annually amount to about twenty-six thousand dollars.

Prussia yields neither salt, wine, nor minerals, except in some places it contains iron ore. It is for the most part a level country. Among the Prussian mountains, that of Goldberg and Goldap are the highest.

The lakes, rivers, and canals, with the neighbouring sea, afford a variety of excellent fish, as salmon, sturgeon, cod, turbot, soles, hallybuts, pike, perch, plaice, eels, and many others.

The principal rivers in the kingdom of Prussia are, the Weichsel, or Vistula, the Pregel, the Memel, or Mummel, the Passarge, and the Alle. These rivers are partly navigable, but at certain times of the year, and in high winds, are apt to overflow their banks, and to cause terrible inundations.

This country is likewise watered by several large bays, lakes, and canals, which yield great plenty of fish, and the conveniency of a communication by water between several towns, the principal of these are,

The Frische Haf, or Fresh Haven, in Latin Sinus Venedicus. This bay is from five to fourteen miles in breadth, and fifty-seven in length. It has a communication with the Baltic by a streight called the Gatt, and in other places is separated from the Baltic by a narrow slip of land called the Frische Nerung. The Gatt is about an English mile in breadth, and twelve feet in depth; and the Frische Haf is so shallow, that no ships of burthen can sail upon it, and therefore they are obliged to unload at Pillau.

The Curische Haf, in Latin Sinus Curonicus. This bay is about seventy miles in length, and twenty-eight in breadth. It is separated from the Baltic by a narrow ridge of land called Curische Nerung, but joins the sea near Memel, where it is about an English mile broad, and nineteen feet deep. This bay is full of dangerous shelves and sand-banks, and is agitated by frequent storms. Its coasts on every side are inhabited by fishermen.

As to inland lakes, this country has many of them from four to thirty miles in length, and five or six miles in breadth; the principal of which are those of Spirding, Angerburg, Rein, and Drausen.

S E C T. II.

Of the Inhabitants of the Kingdom of Prussia. Their Number, Descent, and Religion. Their Manufactures, Commodities, and Coins. The History and Arms of Prussia; the Orders of Knighthood; the Form of Government, and the royal Revenue.

THE number of inhabitants in this kingdom were in the year 1755 computed at six hundred and thirty-five thousand nine hundred and ninety-eight persons capable of bearing arms, and consist of native Prussians, who, from their language and manners, appear to be descended from the Germans; of Lithuanians, who have their peculiar language; and of Poles. Since the year 1719, it is computed that above thirty-four thousand persons have removed from France, Switzerland, and Germany into the kingdom of Prussia, seventeen thousand of whom were Saltzburghers: such advantages has this nation reaped by wisely giving encouragement to all who were persecuted on account of religion, to settle there. These strangers have built four hundred small villages, eleven towns, eighty-six seats, fifty new churches, and founded a thousand village-schools in this country. Little Lithuania is for the most part peopled by these colonies; but it is thought that Prussia can afford both room and subsistence for as many more emigrants.

The Prussian nobility are for the most part descended from the antient Germans, and the peasants are chiefly vassals either to the king or nobles.

With

With respect to the religion of Prussia, the inhabitants are in general Lutherans; but as a great number of the colonists are Calvinists, they have also their churches, not only in the cities and towns, but in some villages they have a particular church appropriated to their use, and in other places they perform divine service in the Lutheran churches. The Papists have a few churches in this kingdom; here are also some Mennonites, and a few congregations of Socinians.

The manufactures in Prussia are daily improving and increasing, particularly the glass and iron works, manufactures of silk, cloth, camblet, linen, and stockings; paper, powder, copper, and brass mills. Prussia is conveniently situated for trade, and to promote it a college of commerce and navigation has been erected, which takes cognizance of all disputes and proposals relating to trade and commerce.

The commodities of Prussia and Great Lithuania sold to foreign merchants, and annually exported, are all kinds of grain, to the amount of twenty thousand lasts; pine trees for masts, deal boards, and other timber; tar, wood-ashes, pot-ash, elks skins, leather, furs, amber, about twelve thousand five hundred stone of wax, honey, manna, linseed oil, flax, hemp, linseed, and hemp-seed; also yarn, hogs bristles, stags horns, and elks hoofs; oat-meal, mead, dried fish, sturgeon, caviar, lampreys, sausages, butter, and tallow, of which last three thousand four hundred stone are exported every year.

The number of foreign ships that resort hither for these goods are supposed to amount to about five hundred and fifty, which import such commodities as are wanted here, as wine, salt, spices, linen and woollen stuffs, herrings, tin, iron, lead, tobacco, sugar, rice, coffee, tea, raisins, almonds, prunes, indigo, Brazil wood, &c.

With respect to the Prussian coins, they are as follow:

Six pfennings, which are only imaginary pieces of money, make a Prussian or Polish schilling.

Three schillings make a Prussian or Polish groschen, each groschen being of the value of seven-fifteenths of a penny sterling.

A Brandenburg piece, of six pfennings, contains two groschen.

An ort is eighteen groschen, which is the highest groschen piece, and is worth about eight-pence halfpenny.

A dollar, which is equal to three shillings and six-pence sterling, is worth three guldens, ninety groschen, five achtzehners, fifteen sefchers, thirty dutchens, or two hundred and seventy schillings.

Ducats, specie dollars, two-third pieces, and other foreign gold and silver coin, are also current in Prussia.

The name of Prussians was unknown till the tenth century, and its etymology is very uncertain: some authors suppose, that the former inhabitants, alluding to their proximity to the Russians, called themselves Porussi, or bordering on the Russians, for po, in the old Prussian language, signifies near.

In that age the kings of Poland took great pains, and even made use of fire and sword for the conversion of the Pagan Prussians to Christianity. Boleslaus I. began with chastizing the Prussians for the murder of St. Albert, or Adelbert, called the apostle of that nation. His successors had also several quarrels with the Prussians: and Boleslaus IV. who committed dreadful ravages in this country, lost his life in an unsuccessful battle in 1163.

In the thirteenth century the Prussians ravaged Culm, Cujavia, and Masovia; upon which Conrad, duke of Masovia, was obliged to apply to his allies, who all wore the cross, which they carried into the field against the Prussians, whom they considered as the enemies of the Christian name. But all their efforts proving ineffectual, the duke applied to the German knights of the Teutonic order, and strongly represented the great importance of defending the frontiers. Accordingly, in 1230, they obtained the palatinates of Culm and Doberzin for twenty years, and afterwards for ever, with the absolute authority of any future conquests in Prussia. These knights, after long and bloody wars during the space of fifty-three years, by the assistance of the sword-bearing knights, subdued the whole country. Afterwards a war broke out between the Teutonic knights and the Lithuanians, which was attended with the most dreadful outrages. These

knights made religion the cloak of their ambitious views, and under the pretence of propagating the gospel of peace, committed the most inhuman barbarities; and it is generally agreed, that they extirpated the native Prussians, and planted the Germans there in their stead. But in 1410 their savage zeal received a terrible check; for after a most bloody battle they were totally defeated.

In 1454 half of Prussia revolted from their obedience to the Teutonic order, and declared for Casimir III. king of Poland. This occasioned a fresh effusion of blood; till at last a peace was concluded in 1466, by which it was agreed, that the part now called Polish Prussia should continue a free province under the king's protection; and that the knights and the grand master should possess the other part, but were to acknowledge themselves vassals of Poland. The knights soon endeavoured, but in vain, to throw off this yoke. In 1519 they raised new wars, which were terminated in 1525, by a peace concluded at Cracow; by which it was agreed, that the margrave Albert, grand master of the Teutonic order, should be acknowledged duke or sovereign of the east part of Prussia, which he was to hold as a fief of Poland, and which was to descend to his male heirs; and upon failure of male issue, to his brothers, and their male heirs. Thus ended the sovereignty of the Teutonic order in Prussia, after it had subsisted three hundred years.

The new duke favoured the introduction of the reformed religion into his dominions, and founded the university of Konigsberg. The elector Joachim added the dutchy of Prussia to the electoral house of Brandenburg, with which it had been long closely connected. The reign of the elector George William was unhappily distinguished by the calamities of a thirty years war, in which Prussia suffered much from the ravages of the Swedes: but Frederic William, his son, was by the conventions of Welau and Bromberg freed by Casimir, king of Poland, from vassalage, and, with his descendants, declared independent and sovereign lords of his part of Prussia. He also obtained a grant of the lordships of Lauenburg and Butow, to be held in the same manner as they had formerly been by the dukes of Pomerania; and having farther increased the power of his electoral house, obtained the title of the Great.

Frederic, the son of Frederic William the Great, and the grandfather of the present king, raised the dutchy of Prussia to a kingdom, and, on the eighteenth of January, 1701, in a solemn assembly of the states of the empire, placed the crown with his own hands upon his head and that of his consort; soon after which he was acknowledged as king of Prussia by all the other Christian powers.

His son Frederic William, who ascended the throne in 1713, peopled his country by the favourable reception he gave to the distressed and persecuted Saltzburghers, and rendered his reign glorious by many useful and magnificent foundations.

This monarch was succeeded in 1740 by his son Frederic II. his present majesty, who has annexed to his dominions the greatest part of Silesia and East Friesland, rendered his kingdom formidable by his valour and uncommon prudence, and promoted the happiness of his subjects by an amendment and reduction of the laws, the increase of commerce, and many other wise regulations.

The royal arms are argent, an eagle displayed sable, crowned, or, for Prussia. Azure, the imperial scepter or, for Courland. Argent, an eagle displayed gules, with semi-circular wreaths, for the marquisate of Brandenburg. To these are added the respective arms of the several provinces subject to the Prussian crown.

There are two orders of knighthood, the first that of the black eagle, instituted by Frederic I. on the day of his coronation at Konigsberg. The ensign is a cross of gold, in the shape of that of Malta, enamelled with blue. In the middle of it, on one side, is a cypher of the king's name, F. R. and at each of the four angles, next the middle, is a black eagle displayed. The knights wear this cross appendant to a broad orange-coloured ribbon over the left shoulder, across the breast to the right hip. On the left side of their breast a silver star is embroidered on the coat, and in the middle of it a black eagle volant,

with

with a laurel wreath in one of its talons, and in the other a thunderbolt, with this motto, SUUM CUIQUE. The sovereign is always grand master, and the number of knights, exclusive of the royal family, is limited to thirty.

Next to this is the order of Merit, instituted by his present majesty, the ensign of which is a golden star of eight rays enamelled with blue, which is worn appendent to a black ribbon edged with silver, and the motto is POUR LE MERITE.

Frederic the Second has new modelled the form of government, and appointed nine chambers of justice for determining causes in trade, and even ecclesiastical affairs. These are subordinate to the high court of judicature at Konigsberg, to which they may appeal from the high court of judicature. An appeal also lies to the supreme court of appeals, where the chancellor sits as president, and, according to the nature of the cause, it may be farther removed to the secret chamber of justice at Berlin.

The supreme college in Prussia is the royal court of regency, which superintends all the affairs of the kingdom, whether civil, political, or ecclesiastical, and likewise all feudal and academical causes. Every member is stiled a privy-counsellor, or minister of state and war, and has his particular department. These are five in number, who have two secretaries. Prussia has its own particular digest of laws, which was published, with amendments, in the year 1721, and have since been improved and reduced into a small compass. There are also two chambers of war and the domains, erected by king Frederic William, one at Konigsberg, and the other at Gumbinnen, that have the direction of every thing relating to the excise, the revenue, commerce, manufactures, magazines, forage, and whatever belongs to the colonies; every war and domain counsellor has his peculiar department. Subordinate to these are the counsellors of the taxes, the provincial receivers of the taxes, the commissaries of war, the officers of the excise and licences, the farmers of the royal districts, and the officers of the revenues in cities and towns.

The royal revenue chiefly arises from the produce of the excise, customs, and services; the farm of the royal domains, stamped paper, almanacs, and news-papers; mills of several kinds; duties arising from venison, and the skins of stags, elks, and other beasts; masts cut in the royal forests; the salt and iron works; the pot-houses, granaries, manufactures, the chest of forfeitures, and the receipt chest, into which the purchase money of posts and employments is paid; amber and the fisheries. The taxes are heavy in Prussia, and our author observes, that whoever would live independent, either in town or country, must be very careful and industrious; but adds, that such persons seldom fail of getting a fortune here, when trade is brisk.

The military forces of Prussia, especially in the present reign, have been no less formidable for their discipline, than by their number: and it may be justly asserted, that for a fine appearance, military discipline, and activity, the army of the king of Prussia has not its equal. The body of cadets at Berlin is a nursery for good officers. Every regiment has its district, or canton, where the young men belonging to such district are registered, and in case of necessity may be ordered to march. But towards the conclusion of the last war his Prussian majesty issued an order, that all the regiments should be recruited with volunteers and foreigners, and that the young peasants of Prussia should remain unmolested.

SECTION III.

A general Division of the Country, and a particular Description of the City of Konigsberg, the Capital of the Kingdom.

THE kingdom of Prussia at present consists of two departments, the German and Lithuanian. We shall begin with the former, which contains forty-four towns, fifty-six governments, and two hundred and eighty parishes, seven of which are inhabited by Calvinists, seven by Papists, and all the rest by Lutherans. Before we

describe the several divisions of this department, we shall give a particular account of the metropolis of all Prussia.

Konigsberg, called in Latin Mons Regius, or Regiomontum, and in the Polish language Krolewies, is seated on the river Pregel, over which it has seven bridges, in the fifty-fourth degree forty-three minutes north latitude, and the twenty-first degree twenty minutes east longitude. This city was founded in the year 1255, when Premislaus I. king of Bohemia, coming to the assistance of the Teutonic knights against the pagan Samlanders, a castle was built by his advice, and afterwards a town which was named Konigsberg, in honour of that prince; but in the year 1264 Konigsberg was rebuilt on another situation.

It is a large beautiful city. The rampart with which it is surrounded is about seven English miles in circuit, and has thirty-two ravelins and eight gates. This rampart incloses several gardens, the large castle moat, and some meadows and fields. However, the whole circuit of the city is above eight English miles, and contains about three thousand eight hundred houses; the inhabitants amount to sixty thousand souls. Konigsberg properly consists of three towns joined together, Altstadt, Lobenicht, and Kneiphof, and of several suburbs.

Altstadt, which signifies the Old Town, was particularly called Konigsberg till the year 1455; but afterwards it was named Altstadt, to distinguish it from Lobenicht. It contains sixteen streets, in which are five hundred and fifty houses, above one hundred of which are malt-houses and brew-houses. It has six gates, besides four posterns, two strong built towers, and four bridges. Its other public edifices are the parish-church of St. Nicholas, which is of very great extent; the parish school, which has nine masters, and in this edifice is the city library; the poor-house, which is for the maintenance of thirty poor scholars; the town-house; the junkerhof, where weddings and other solemnities are celebrated, and which has a garden belonging to it; the common garden, which is frequented by artizans and mechanics; and lastly, the hot baths.

The suburbs of Altstadt are the Steindam, which is extremely well built, and contains eleven streets, with the oldest church belonging to Konigsberg: the suburb called the New Ross-Garten; on an eminence in this suburb stands the New Ross-Garten church; here is also a large hospital for the burghers widows, an orphan-house, pest-house, and shooting-ground: the Laacke, in which are the city timber-yard, and a long pleasant walk called Reifferbahn: the Lastadie, in which are the merchants magazine, the ware-houses, the pack-houses, the herring-bridge, the crane-wharf, the wine-wharf, the tar-wharf, and the king's licence-house, in which the colleges of admiralty and licences meet every Monday and Thursday. Without the wooden gate of Altstadt lie the coal-magazines, many of which are now converted into dwellings; and the Lomse, or Lanse, in which are handsome houses, with delightful gardens. The last suburb of Altstadt is Dam, where are erected manufactures for woollen cloth, stockings, and leather.

Lobenicht was built about the year 1300, and was formerly called Neustadt, or the New Town. It has four gates, and is divided into two parts; one which stands on an eminence, is usually called Der Berg, or the Mountain, and contains the city church, the city school, and a public garden: in the other part, which has a lower situation, are the town-house, the junkerhof, the weigh-house, a large hospital, which has a church, and was once a convent; and the Munchenhof, which was formerly a monastery, but has been converted into a store-house.

Without the gate of Lobenicht are several suburbs, among which is Sackheim, which is almost as old as the city itself, and consists of five long streets, intersected by others that run across them; and has a Roman catholic church, a German Lutheran church, a Lithuanian Lutheran church, the royal orphan-house, with its chapel, and the king's great and little timber-yard, with the offices belonging to it.

Kneiphof, the most modern of the three towns, was not founded till the year 1324. It stands on an island formed by the river Pregel, and is erected on piles of

tree, which, by length of time, are become as hard as iron. It has five large gates, and thirteen streets, among which the Long street is the finest in the city of Königsberg. Among the public edifices in Kneiphof the following are the most remarkable: the fine cathedral, in which is the famous organ finished in 1721, which consists of five thousand pipes; and the Wallenrod library, which has above five thousand books: the grammar school: the poor-house stands near the cathedral, and contains thirty poor boys, which are decently provided with all kinds of necessaries. On the other side of the cathedral stands the bishop's palace. The other buildings are the university, or college, as it is called, which has thirty-eight professors, exclusive of the tutors: in the refectory are eight tables, and twelve persons sit at each of them: twenty-eight of the students have their commons gratis, besides several exhibitions, or pensions, which are bestowed according to merit and the circumstances of the pupils. The town-house, which is a very fine building, where the magistrates of the three towns meet every day: the edifice where the royal German society meet: the junkerhof: the exchange for merchants, which is embellished with curious paintings, in sixty compartments. Not far from the exchange is a foundation for students. There are also the exterior and interior suburbs.

We shall now describe the palace, which is built in the form of an oblong square, with an area within it, that is a hundred and thirty-six paces in length, and seventy-five in breadth. The north side appears to be extremely ancient, and even to have been built when the knights of the Teutonic order flourished. The south and east wings were erected by the margrave Albert the Elder, and the margrave George Frederic added the west side of this structure. In the last are the Lutheran court church; the library, which is opened on Wednesdays and Saturdays; the domain office; the supreme court of justice; the Samland consistory; the room where the archives of the court are kept; the Moscovite-hall, as it is termed, which is two hundred and seventy-four feet long, and fifty-nine broad; and the college of physicians.

In the east wing are the great palace-gate, with apartments for the principal ministers of state, and the royal apartments; within a pavilion are the chamber of war, the domain-chamber, the accompt and rent-chamber, and the excise-office.

The north wing contains the amber-office, the private chancery, the apartment in which the archives of the Prussian supreme court are kept, the fief-chamber, the revenue-office, the privy-chamber, where the lords of the regency meet, the accomptant's-office, the college of health, the high tribunal, and the apartments in which the states of the country assemble, and the provincial chests are deposited.

In the south wing are several kitchens and apartments for the royal family and foreign princes; at one end of it stands the palace tower, which is ascended by two hundred and eighty-four steps, and affords a noble prospect of the whole city and the adjacent country. The stables, the wardrobe, the pleasure-garden, and the great and little park are very beautiful.

In the liberties of the palace, which are five in number, the most remarkable places are the mint, the German Calvinist church, the new French church, the German school, where a congregation of Polish protestants assemble, the Jews school, the college, the gardens belonging to the palace, and several other structures, with some streets, in which are many elegant houses.

The strong citadel, called Fredericksburg, stands facing Kneiphof, at the conflux of the two branches of the Pregel. This fort is a regular square building, surrounded with broad ditches, and by the river Pregel; and within it is a church and an arsenal.

Königsberg has always distinguished itself by its commerce; for it was formerly one of the Hanse-towns, and its trade is still in a flourishing condition. The river Pregel, which is here navigable for the largest ships, is from a hundred and twenty to two hundred and forty feet in breadth. In the year 1752 there arrived in this port four hundred and ninety-three ships, besides two hundred and ninety-eight smaller vessels, and three hundred and seventy-three floats of timber.

Most of the inhabitants of Königsberg are Germans of the Lutheran profession, and a colony of French Calvinists of about fifty families are settled there. Commerce has introduced the Polish and Lithuanian languages into this city.

Besides the poor who are provided for in alms-houses and hospitals, above eight hundred indigent persons receive weekly pensions out of the general charitable fund, which is a proof of the opulence, as well as of the humanity of the inhabitants.

We shall now give an account of the several divisions of the kingdom of Prussia, and the principal places in each. The German department is divided into German Samland, Old Natangen, and Oberland.

SECT. IV.

Of the Province of German Samland, and the principal Places it contains; with a particular Description of Pillau and the neighbouring Country, and the remarkable Peninsula called Frische Nerung.

THE district of German Samland contains three governments, the most remarkable places in which are,

Pillau, which is esteemed the bulwark and key of Prussia towards the sea. It stands on a point of land that projects into the Baltic, in the fifty-fourth degree forty-five minutes north latitude, and in twenty degrees five minutes east longitude. It is well fortified: the fort is nearly a regular pentagon: the bastions make a grand appearance; and all the buildings belonging to the fortifications are strong, regular, handsome, and well planted with cannon; and the fort has a magazine for military stores. The streets are broad, and run in a straight line; and the houses are built and furnished in the Dutch taste: the harbour is a very fine one, and vessels of great burthen are cleared and take in their lading here, for the Frischehof has not a sufficient depth of water to carry them to Königsberg.

The city is frequented by people of various nations. Below the gate of the castle is a stone equestrian statue of Frederic William the Great, and over the gate is a fine watch-tower, where a centinel stands day and night. There is also a church in the fort, which serves both for the Lutherans and Calvinists. Over the gate on one side of the entrance towards the out-works stands the image of Mars in a bold attitude, looking towards Sweden.

The peninsula which extends from beyond Pillau to Fischhausen is, from its extreme pleasantness and fertility, called the Paradise of Prussia; for it not only yields great plenty of the necessaries of life, but every thing that contributes to pleasure and entertainment. Near the above fort is a fine plain, where the Frischehof forms a semi-circular bay, which is frequented by a multitude of swans, sea-mews, wild-ducks, and other water-fowl. On the other side of this bay lies Old Pillau, which consists of two contiguous villages, inhabited by fishermen; these are called Alt Pillau and Wogram. In Alt Pillau is a public burying-ground, and near the church stands on a steep hill a building which was formerly the custom-house. This strong lofty edifice serves as a land-mark for the ships bound to Pillau, and nothing can exceed the prospect this place affords, for it extends to a part of Samland, Natangen, and Ermeland; and is diversified with a view of the ships coming in and going out of the harbour, and of the Nerung, or narrow slip of land that lies between the haven and the sea. In a contiguous village, called Wogram, lies the storbude, where the sturgeons are boiled and packed up, and where caviar is made of their roes; most of which is exported to England. The fishermen in these parts catch at least thirty different species of sea and fresh-water fish; and in some parts of the year are seen astonishing flights of thrushes, blackbirds, and magpies. Round these villages are a great number of kitchen-gardens and orchards. After passing this delicious spot about Old Pillau, you cross a barren piece of land to a well cultivated farm, and the Pillau Krug, as it is called, which is a public-house seated in a most delightful grove, consisting of various kinds

kinds of trees, whose branches are so closely interwoven, as to afford a good shelter from the rain. It was probably from this delightful grove that the adjacent country obtained the name of Paradise.

It will be proper to take particular notice here of the Curische Nerung, called in Latin Peninsula Curonensis, which is a narrow slip of land that separates the Baltic sea from the Curische-haf, and is about sixty miles in length, and in most parts one in breadth. This peninsula is a barren sandy tract, where the high winds frequently make great ravages by tearing up the pine trees by the roots, and blowing up the sand into high ridges and hills, which sometimes obliges the poor inhabitants to remove their dwellings. Most of the trees, particularly on the Baltic side, are more or less blasted, and appear like bare trunks; they however afford shelter for stags, falcons, and great numbers of thrushes. There are several small mean villages on this peninsula, in which the inhabitants live chiefly by fishing, and have very few cattle.

The next place we shall mention is Welau, an ancient well built town, founded in 1336. It is seated on an island at the conflux of the Alle and the Pregel, and consists of two principal and five cross streets, two suburbs, and two hundred and sixty-four houses. It has about a hundred and fifty burghers, besides the other inhabitants. Great part of this town was burnt in 1736, since which time the buildings have been much improved; however, it has not recovered its former trade. It is chiefly remarkable in history for the treaty concluded there with Poland in September 1657, when the elector Frederic William was invested with the sovereignty of Ducal Prussia.

In this district are several navigable rivers that abound with fish, and canals that are also of great service to trade.

Among the latter is the New Deim, which begins at the royal manor of Schmerberg, and is carried above ten miles, till it enters the Pregel.

Two new canals called Great and Little Frederic's canal, which join the river Deim to the Wippe and Nemmonin, and also the latter to the Gilge. Great Frederic's canal commences at the Wippe, which is a branch of the river Nemmonin, and is carried on for fourteen miles to Labiau, a trading town on the river Deim. Little Frederic's canal begins at the river Gilge, and extends about six miles in length to the river Nemmonin. These works, which are very convenient for the trade with Poland, were executed between the years 1688 and 1696, by order of the countess-dowager of Waldburg; and the counts of Waldenburg received a toll from all vessels which passed through them, till the king purchased that right in the year 1713, and made it a part of the royal domains.

We now come to that division of the kingdom of Prussia called Natangen, which is a populous and well cultivated country, consisting partly of arable and partly of meadow land; and though the soil is in some parts very stony, it produces better corn than either Samland or Little Lithuania; it is also well wooded, and yields all sorts of game and great plenty of fish.

Old Natangen contains eight governments, the most considerable places in which are,

Gerdauen, a small town in the government of the same name, was built in the year 1325. It is seated on the river Omet, and has two castles belonging to the count and baron Schlieben. The new seat is a magnificent structure, and has an elegant garden. The town derives its name from E. Gerdaw, a Prussian nobleman, near whose castle it was built in the year above-mentioned. In a lake near this town is a floating island, which is a plat of ground covered with verdure, and driven backwards and forwards from one bank of the lake to the other. It was formerly three hundred and fifty paces in length, and two hundred and fifty in breadth; so that it afforded pasture for a hundred head of cattle: but it is at present divided into several little pieces, which are continually decreasing. This island is called the Gerdauen Almanac, because the inhabitants of the town prognosticate approaching storms by its motions.

Rastenburg, a handsome town, with a castle, in a government of the same name, and seated on the river Guber. It was built in the year 1329; and though it was destroyed by the Lithuanians in 1348, it was soon rebuilt, together with its castle, and put in a more defensible state than before. It is inclosed with a wall and a rampart. The German parish church is the largest and handsomest structure of that kind in all the Prussian inland towns, except the cathedral of Marienwerder, and the senior of the three ministers who belong to it has the superintendency of forty-six churches. The church of St. Catharine stands in the suburbs, and is one of the most antient in the kingdom of Prussia; and in the middle of the great hospital is the church of the Holy Ghost. This hospital was founded in 1361, and consists of two wards, in which twenty indigent persons are comfortably provided with food and a pension in money. In the second hospital twenty-five poor persons are maintained by the alms of the charitable. Here is also a school, under the direction of a rector and three assistants. The burghers amount to about two hundred, most of whom are Lutherans; and the inhabitants are supported by brewing, agriculture, and mechanic trades. This town is possessed of the largest territory of any inland town in Prussia, except Fischhausen.

Angerburg is a modern well-built town, situated in the government of the same name. It is encompassed with pallisadoes, and defended by a strong castle, built in 1335 on the bank of the lake where the river Angerap has its source. This lake, which is seven German miles in length, and one and a half in breadth, is of great service to the town. The church of Angerburg is a large handsome structure. An arch-presbytery was founded here in the year 1725.

By the side of the above lake, and about five miles from Angerburg, is Steinort, a noble seat of count Lelendorf, which has one of the finest gardens in all the country. The island which belongs to it, and is situated in the lake, with the summer-house built upon it, are extremely pleasant.

SECT. V.

Of the Province called Oberland, with a Description of its most remarkable Towns.

THE country of Oberland is fertile, rich, and well cultivated, and was formerly so populous, that it could bring into the field an army of ten thousand horse and foot; but the people having, on several occasions, exercised great cruelties towards the Christians, the Teutonic knights, in the year 1273, ravaged the country, and made themselves masters of it. Oberland, at present, consists of nine governments, the principal places in which are as follow:

Marienwerder, in Latin Insula Mariana, and in the Polish tongue, Kwidzin, is a well-built town, with a castle, which stands on the frontiers of Pomerania, on the Leibe, at a small distance from the Vistula. Marienwerder is situated in the forty-third degree fifty minutes north latitude, and was first built in 1233, on a werder or small island called Kwidzin, but was soon after rebuilt on the spot where it now stands. The cathedral, which was erected about the thirteenth century, is the largest church in the kingdom of Prussia, it being three hundred and twenty feet long, and by its strong breast-works appears to have formerly served for a fortress. The palace of Marienwerder is a spacious building, erected in the Gothic taste. The adjacent country is very pleasant, and filled with eminences and gentle declivities. The inhabitants carry on a considerable trade with their neighbours. Salt-works were set up here in the year 1723, and in 1728 was built a magazine for corn and forage. This town has been often damaged by inundations, war, and fire. The league against the Teutonic knights was concluded here in 1440, and in 1520 the town held out against a vigorous siege. In 1709 the czar Peter the Great had an interview at this place with Frederic I. king of Prussia; and king Stanislaus retired thither from Dantzic in 1734. The suburbs

of Marienwerder are continually improving, and the adjacent country is fertile and well inhabited.

Reisenburg stands on an eminence near the river Leibe, in the fifty-third degree forty-eight minutes latitude, and derives its name from the adjacent Prussian territory, which was anciently called Refin. The Poles call it Prabutha, which signifies a ruinous house: indeed it is a mean town, with narrow streets. It was built in 1169, and the castle, which is even still more ancient, stands on a hill, and is extremely decayed. The town contains a German and a Polish church. The burghers, besides having a little commerce, subsist by brewing, agriculture, and feeding of cattle. In the year 1323, 1414, and 1422, Reisenburg was burnt by the Poles. It was also consumed by fire in 1628, 1688, and 1728.

Mohrungen, a little town in the government of the same name, is situated to the north-east of Reisenburg, and is said to have been founded in 1302, and completed in 1328; but the old castle is more antient. Count Dohna has here a remarkable seat. The town is well built, and surrounded with good walls and a double moat; besides, it is almost encompassed by the lake of Mohrungen. As this town lies in the road to Poland, it is much frequented by strangers. It was entirely destroyed by fire in 1697; but has been since rebuilt in a much more handsome manner than before.

Osterröde, a well-situated trading town, in the province of the same name, seated by the river and lake of Dribentz, which supply it with plenty of fish. It stands in the fifty-third degree forty minutes north latitude, in a sandy, but fertile country. Salt-works have been set up there, and the inhabitants carry on some trade with Poland. Some ancient Roman coins have been found at a small distance from the estate of Gorlitz, which belongs to his Prussian majesty.

Holland is a handsome town, seated on an eminence near the river Weefke, in the fifty-fourth degree four minutes north latitude, and has a strong fortress. It is said to have been built by some Hollanders of distinction, who fled hither on account of the murder of count Florentius V. from whom it obtained the name of Holland. Its situation renders it naturally strong, and besides, it is surrounded with a wall and towers. The streets are long and broad, and the houses well built. To this town belong two suburbs, and several country seats with pleasant gardens. The inhabitants have a free fishery, and the liberty of going out in their boats on the lake of Drausen. St. Bartholomew's church is a large handsome structure. The Calvinists celebrate divine service in a large hall which belongs to the fortress, and without the town stands a church dedicated to St. George. Here is also a good hospital, salt-works have been erected in the town, and likewise a public magazine for corn and forage. The present castle was begun by duke Albert, and completed by George Frederic. It is encompassed by moats and walls, and has fine apartments that yield a noble prospect.

SECT. VI.

Of the Department of Little Lithuania, and the Polish Governments subject to the King of Prussia, with the principal Places contained in each.

IN this division are eighteen towns, sixty-two districts, and a hundred and five parishes.

Little Lithuania is a hundred and fourteen miles in length, and from thirty-eight to fifty-seven in breadth, but was antiently over-run with thickets and woods, and in 1710 was almost depopulated by the pestilence; but in 1720 king Frederic William generously assisted twenty-thousand French protestants, Palatines, Franconians, and Swiss, at the expence of five millions of rix-dollars, to settle in this country; and in 1732, three hundred and fifty thousand dollars were distributed among a fresh colony of twelve thousand five hundred Saltzburghers. By the skill and industry of these people, this desolate country has been extremely well cultivated, superfluous woods have been rooted up, morasses drained, and a multitude of towns, villages, farm-houses, and churches built;

whence the country has put on a new appearance, and now makes ample returns for the great sums which his Prussian majesty wisely laid out upon it. The richness of the pastures, the many thousand lasts of corn which are either exported or laid up in the king's granaries, the fine horned cattle, excellent horses, and numerous flocks of sheep, with the excellent butter and cheese this country affords, are incontestible proofs of its uncommon fertility. It also abounds with wood for fuel, and has plenty of game and fish. Several manufactures of coarse and fine cloth, leather, &c. are also established here.

The ancient inhabitants of Little Lithuania have a peculiar language, into which the Bible, the Catechism, and some books of devotion have been lately translated. The Lithuanians of this country are far from being so stupid as they have been generally represented; but like other nations they have their good and ill qualities. Among the colonists the Swiss are chiefly employed in grazing and breeding cattle; the French are well versed in trade, and skilled in the cultivation of tobacco, which they have introduced into this country; and the Saltzburghers are remarkable for their skill in agriculture. The Swiss, French, and Franconians, are all Calvinists, so that there are ten German and French reformed parishes, as they are called in Little Lithuania, and the rest are Lutherans, with very few Papists among them.

There are four governments in the Lithuanian department, the principal places in which are,

Memel, a trading town, port, and fortress, seated at the northern extremity of the bay called Curische-haf, in the fifty-fifth degree forty-six minutes north latitude, and in the thirty-ninth degree nineteen minutes east longitude. It was built in the year 1279, and fortified in 1312, and has on one side the Baltic, and on the other the Curische-haf, besides which it is watered by the river Dange. The harbour is deep and has a very good entrance, and within these few years has been improved with two moles, which are carried above fifty rods into the bay. The town lies under the guns of the fort, and is well inhabited; it consists of above four hundred houses, and besides the German church, here is one belonging to the Lutherans and another to the Calvinists. The burghers, who are divided into those of the Old Town and Frederic's Town, are employed in commerce, brewing, soap-boiling, agriculture, fishing, &c. Great quantities of flax, hemp, thread, and linseed, are annually exported from this town. In 1752 seventy ships arrived in this port, and sixty-nine sailed from thence to other ports. Memel is fortified with three whole, and two half bastions, with other works all in the modern way. The citadel consists of four pretty regular bastions, with ravelins and half moons. The buildings and apartments in this citadel were much improved by the elector Frederic William and king Frederic I. The most remarkable things within it are the two arsenals, the superb house of the commandant, the garrison church, and the powder-magazine. In this town is likewise a college of justice, a salt-factory, and a post-office, which brings in a considerable revenue.

The next city worthy of notice, is that of Tilsit, the capital of the government of the same name. This city is, next to Königsberg, the largest and most opulent place in the kingdom of Prussia, and carries on the greatest trade; for the river Memel, which runs along the north side of it, affords the advantage of a very great trade with Königsberg, in linseed, corn, butter, and other provisions. It is situated in the fortieth degree east longitude, and in the fifty-fourth degree fifty minutes north latitude. Tilsit, properly so called, consists of two long streets of a considerable breadth, called German-Street and High-Street, contiguous to which is the suburbs, called the Liberty. The number of houses in this city amount to about six hundred, and the inhabitants to seven thousand souls. The ecclesiastical buildings are a Lutheran German church, near which is the royal provincial school, a Lithuanian church, and one belonging to the Calvinists. Without the town stands a Lutheran chapel, and at about the distance of an English mile is a Romish chapel. Here is an hospital, where ninety indigent persons have a comfortable subsistence; and in the pest-house the sick and lame, as well as those infected with

with contagious diseases, are carefully provided for. Here is also a poor-house, in which ten poor boys are maintained, besides a number of widows. Salt-works are also established in this town.

The flat country about Tilsit, which is eighteen miles in length, and as many in breadth, is one of the most fertile spots in the whole kingdom; and the inhabitants furnish not only Prussia, but other places, with excellent butter and cheese, and the fisheries in this place are also very considerable. The natives breed great numbers of horned cattle, and the horses are large and strong, but clumsy. Barley is almost the only grain sown in these parts, which at present afford little or no wood. The marsh lands are exposed in spring to inundations by the overflowing of the rivers, which frequently do much damage.

Ragnit, a small town, about five miles to the eastward of Tilsit, is seated on the river Memel, and in the government of Ragnit. It is surrounded by palisadoes, and has a castle, which is one of the most antient structures in the country, and was famous even in times of paganism. In this castle is a very large royal magazine for provisions, &c. and the prospect from a part of it, called Konigsberg, is hardly to be equalled. On the other side of the Memel is a mountainous, but delightful country, which, from its extraordinary fertility in corn and pasturage, is called the Larder of Lithuania. Here are prodigious flocks of sheep, great plenty of all kinds of game, and excellent horses.

Insterburg, a town in the government of the same name, is seated on the Angerap, near its conflux with the Inster, where it assumes the name of Pregel, in the fifty-fourth degree thirty-four minutes latitude, and the thirty-ninth degree forty-four minutes east longitude. This town was built in 1572, and surrounded with palisadoes in 1727. It contains about three hundred and fifty houses, and three thousand inhabitants; and besides the Lutheran churches, there is one belonging to the Calvinists. The castle was built in the middle of the fourteenth century, and much improved by king Frederic William. Here is a court of judicature for the administration of justice in all the Lithuanian governments, and also a granary and salt factory. The town carries on a considerable trade in corn, and very excellent beer, remarkable both for its wholesomeness and strength.

Gumbinnen, which lies to the south-east of Insterburg, is a town regularly built since the year 1725, in a very pleasant and fertile country on the river Pisse. It consists of about two hundred houses, and the number of its inhabitants amount to three thousand. The antient deputation-chamber, and the war and domain-chambers, have been removed to this place. The public buildings are the conference-house, the town-house, and the magazine, which was built in 1742. The other public buildings are the Calvinist church in the New Town, and the Saltzburg alms-house. Here is a good cloth manufactory.

The last town we shall mention in the Lithuanian department is Stallupenen, a newly built town, to which a charter was granted in the year 1722. The inhabitants carry on a considerable trade in cattle, and a good fair is held here; but fresh-water and wood for fuel are very scarce.

There are also several districts stiled Polish governments, and two other districts subject to his Prussian

majesty, all of them bordering on Little Lithuania; the principal places in which we shall now describe.

Oletzko is a castle in the government of the same name, and was much embellished on the inside in the year 1640. Near it stands the large and regular town of Margrabowa, which derives its name from the Margrave Albert, who built it in memory of the interview he had in that place with Sigismund Augustus, king of Poland; and the latter in 1560 also caused a new town to be built on the Polish frontiers, about eight German miles distant from Margrabowa, and from his own name called it Augustowa. The market-place of Margrabowa is the largest in Prussia, and in it stands the church, which is entirely detached from any other building. In the neighbourhood of this town the electoral and Swedish troops defeated the Tartars in 1656, and released the prince of Radzivil, whom they had taken prisoner.

Lick, called in Latin Licca, is a trading town in the government of Lick, seated on the lake of Satrind, in the fifty-third degree fifty minutes north latitude, and the forty-third degree three minutes east longitude. The castle, which was built in 1272, is pleasantly situated on an island: but the town has nothing worthy of notice, except its church, the provincial school, and the archpresbyter's mansion-house. This country suffered extremely by the inhuman ravages of the Tartars in 1656, till they were defeated and driven from the frontiers by the battle of Warsaw. The adjacent country yields plenty of wood, and abounds with fish and other provisions.

The villages of Talussen and Kussinowen in this district are chiefly inhabited by Arians, who live in a quiet inoffensive manner, and perform their devotions in private houses.

Johannesburg is a small but handsome town, seated on a plain near the lake of Spirding, in which are four islands and plenty of fish. It is seated in the fifty-third degree thirty-five minutes north latitude. Here is a castle, which was once fortified, a large granary, and a magazine for forage; and in this town an archpresbyter resides. In 1698 the elector Frederic had here an interview of four days with Augustus II. then newly elected king of Poland.

The king of Prussia is also possessed of two lordships in the Polish territories. Tauraggen, a large district near the river Juhr, in Samogitia, which has an excellent breed of horses, abounds with fish, and yields plenty of game. This district devolved to the house of Brandenburg in 1691, on the decease of the princeps of Radzivil.

The other is Serrey, in the great dutchy of Lithuania, and the palatinate of Trocko, and contains twenty-two villages, three manors, and twenty great and small lakes. This lordship devolved to the house of Brandenburg by the marriage of Lewis Margrave of Brandenburg with the princeps Ludovica Carolina of Radzivil.

The other dominions of his Prussian majesty are entirely separated from this kingdom, and are even much more extensive; but the description of the dutchy of Brandenburg and Silesia must be deferred till we enter upon the German empire. We shall now therefore proceed farther to the north, and describe the extensive country of Sweden.

C H A P. V.

Of the Kingdom of S W E D E N.

S E C T. I.

Its Situation, Extent, Climate, Coasts, Rivers, Fossils, Minerals, Vegetables, and Animals.

UNDER the name of Sweden is included that extensive country that lies between Denmark, Norway, and Russia : having Russia and the Baltic on the east ; the Baltic and the gulph of Finland on the south ; Norway, the Sound, and Categate on the west ; and Norwegian Lapland on the north : extending from fifty-five degrees forty minutes to the sixty-ninth degree of north latitude, and from the twenty-eighth to the fortieth degree of east longitude from London ; stretching about two hundred or two hundred and fifty Swedish miles in length ; and as each Swedish mile is at least equal to six English, its length may be computed at about fifteen hundred miles, its breadth is reckoned to be a hundred and thirty Swedish miles, or seven hundred and eighty English, and its area is computed to amount to ten thousand square Swedish miles, or sixty thousand English.

The climate of this country is very healthful, but the winters are extremely cold, more especially towards the north. The air is, however, clear and salubrious. In the long nights of winter the moon, the reflection from the snow, and the clearness of the sky, give such light that one may travel as conveniently as in the day. In summer the days are very long, and the heat intense ; but the nights are luminous, and exceeding pleasant. Violent storms of wind and rain are seldom known here, and the sharp keen north wind serves to purify the air. We shall give a more particular account of the climate of the northern parts in treating of Swedish Lapland.

The highways in Sweden are better than can be imagined, considering the many rugged mountains and rocks in the country. These are in a manner plained and made even by the peasants, so that, as Motraye observes, there are scarce better roads in any country in Europe ; nor can a man any where travel with more security and less expence ; for horses are hired for about a penny a mile : but then there are very poor accommodations on the road, both for lodging and diet. The easiest and most expeditious method of travelling is in winter, when they make use of sledges, especially in those parts of the country which abound in lakes and rivers ; for these being all frozen, they meet with no obstacles in their way, and they can more conveniently carry provisions with them in a sledge than on horseback.

The coasts of Sweden are encompassed with innumerable capes, rocks, and islands ; so that the approach to the continent is something dangerous : these they call sheers, and they derive their distinguishing names from the provinces opposite to which they lie, as the Upland sheers, the Sundermanland sheers, &c. These islands, or rocks, lie very near each other, and are of different dimensions. Several thousands of them are inhabited by people who live chiefly by fishing.

The lakes of Sweden are very numerous : the large ones amount to seventeen.

The number of rivers in Sweden is likewise very considerable ; the largest of them are in the Swedish language called Elbe. The principal of these are the Dal-Elbe, in the vale country, which is the largest river in Sweden : the Gullspang, which divides West Gothland from Wermeland ; the Gothische-Elbe, or Gothic river, which rises in the lake of Wener, and about forty-five miles before it falls into the North Sea forms a cataract, by precipitating itself from a high precipice : the Stang, which divides East Gothland into two parts : and the Motalastrom, which issues from the Wetter-lake, being increased by seventeen smaller rivers, forms a cataract, by falling sixteen feet, and discharges itself into the Baltic.

Both the lakes and rivers abound in fish of several kinds, the principal of which are salmon and trout of various sorts.

Sweden likewise affords medicinal springs of experienced virtue.

This country abounds with minerals and fossils of all kinds, as topazes, amethysts, crystals, cornelians, agate, a reddish stone called violstein, coral, a greenish semipellucid stone, porphyry, lapis-lazuli, asbestos, loadstone, touch-stone, free-stone, mill-stones, stucco-stones, slate, lime-stones, coarse and white marble, and beautiful petrifications ; also excellent white marble with beautiful green veins, which are sometimes of a dark, and at others of a bright vivid green, finely interwoven, marienglas or isinglas, vitriol, mercury, amianthus, lead ore, cobalt, allum, fullers-earth, petroleum, sulphur, mother of pearl, &c. gold, silver, tin, lead, copper, and iron.

Though Sweden is extremely mountainous, it affords many tracts of even ground fit for agriculture. The soil is in general sandy or swampy, but is not void of fertility. Gothland produces the greatest quantity of grain, as wheat, rye, barley, oats, and pease ; but every part of Gothland is not equally fertile. Sweden also affords good pastures, and in the southern parts some orchards, which yield fine fruit ; but this country is more famous for its mines than the produce of the soil. Nordland, being full of rocks and mountains, produces but little corn ; however, it has some spots fit for grazing. Lapland yields still less grain than Nordland ; but Finland is in most places extremely fertile, though it is far from being properly cultivated. The corn in the short but hot summers of this climate suddenly grows up and ripens ; but it is far from being sufficient for the subsistence of the inhabitants, and therefore several hundred thousand quarters are annually imported from abroad, particularly from Livonia, Pomerania, and Wismar.

Some patriots among the Swedes strenuously endeavour to promote schemes for the encouragement of agriculture and manufactures ; and if the success be answerable to the present favourable appearances, the produce of the country will soon be sufficient to support some millions of inhabitants more than it does at present, and that in greater affluence and plenty.

In the year 1752, the king granted the new society of agriculture a great deal of waste land for forty or fifty years rent-free, and exempted them from taxes. Hitherto considerable advantages have been made in the forests by cutting down the trees, burning them, and strewing the ashes on the land before it is sown. This sort of ground thus prepared yields a great crop of corn for three years after.

The south parts of Sweden produce pretty good fruit and vegetables ; but towards the north these gradually become more scarce, they degenerate in flavour and goodness, and in the most northern parts no such vegetables are to be found.

In the beginning of the summer the fields in the south are stored with variety of flowers, and, according to some authors, strawberries, raspberries, and such kind of fruit grow upon every rock. In dry years melons are brought to perfection in the gardens ; but peaches, apricots, and other wall-fruit, are extremely scarce, as are also pears, apples, and plumbs ; and those they have are not well tasted. They have, however, cherries of several sorts, and some tolerably good. According to Motraye, the gardens about Stockholm are very fine, and, notwithstanding the severity of the winter, their green-houses afford orange, fig, myrtle, and other trees, plants, and flowers of the most tender nature. Finland produces excellent turnips ; and flax, hemp, and tobacco, are cultivated to great advantage. Their woods chiefly consist

of pines, beech, birch, alder, juniper, and some oak ; which are generally straight, tall, and fit for building. But the extensive woods in Sweden become thinner, and daily decline from the immense consumption of wood in making charcoal, tar, pitch, pot ash, and burning the land. Oaks in particular grow very scarce.

In several parts of Sweden the inhabitants subsist by grazing, but in all the northern countries, the cattle are small, and the wool of the sheep very coarse ; so that in order to mend the breed, rams are imported from England and Spain. The horses are strong, hardy, and vigorous. Of the extraordinary advantages they reap from their rein-deer, we shall give a particular account in our description of Lapland. This kingdom affords plenty of all sorts of deer, elks, hares, and all sorts of tame and wild fowl ; and some parts of Sweden are much infested with lynxes, bears, wolves, foxes, otters, martens, and weasels.

Tame and wild fowl are very plentiful and good ; the reder, which is as large as an ordinary turkey, is much admired, as is also the orras, which is about the size of a hen. Partridges abound here, as does also a bird called yerper, which has some resemblance to a partridge. In winter they take great numbers of black-birds, thrushes, and of a beautiful bird of the bigness of a field-fare, whose feathers are tipped with scarlet, and are supposed to come from Lapland in the hard season. They have but few pigeons. The northern countries abound with eagles, hawks, and other large birds of prey.

S E C T. II.

Of the Persons, Dress, and Manners of the Swedes ; the Number of the Inhabitants, their Employments, Food, Language, Skill in the Sciences, Religion, and Hierarchy. The Progress of the Arts and Manufactures ; with a concise Account of the Trade and Coin of Sweden.

THE Swedes are of a good stature and robust constitutions, capable of enduring hardships and fatigues. Where they are not too much exposed to the weather they have good complexions, and their hair, like that of other northern nations, is inclined to yellow. The women are of a just proportion ; they have also good features, and those who are employed at home are generally fair : but the peasants generally make their females undergo an equal share in all laborious employments. They go to plow, thresh their corn, row upon the water, serve the bricklayers, and carry burthens like the men. The inhabitants are, however, far from being sufficient to people the country ; there is a remarkable instance of this in one place, which though not the most northerly part, there are hardly four thousand seven hundred people to be found in the compass of twelve hundred and seven square miles.

The number of inhabitants of Sweden and Finland have been computed by some learned Swedes at about three millions, reckoning eighty thousand farms, on which are one million six hundred thousand souls, including the women, children, and servants ; and it is said, these farms make up above half the number of the inhabitants in the whole kingdom. Indeed at present some parishes are so extensive, and at the same time so thinly inhabited, that a peasant must travel several Swedish miles to visit his next neighbour ; others contain not more than seventy farms, and yet take up a tract of land equal to the whole province of Holland, though perhaps such a parish has not so many cottages as there are towns in that flourishing country.

The common people subsist by agriculture, working in the mines, grazing, hunting, fishing, and commerce, both domestic and foreign. Indeed the wealth of Sweden arises from its mines, some gold ore has been discovered, and there are several large silver mines said to be very rich. The number of the copper mines, hammering mills, and smelting-houses, is very considerable. Iron ore is in such plenty that it generally appears on the surface of the earth, and is remarkable for its richness.

Indeed the produce of the mines constitutes two-thirds of the national revenue.

The inhabitants of the north parts of Sweden are strangers to delicacies, and live very hardly. They eat a sort of bread made of the bark of birch and pine-trees, straw, and roots. The hacke, or stampe, is a kind of bread very common in the north ; and in times of scarcity is sometimes used in the south parts. This is made of the ears of corn cut from the stems and chopped small ; after which it is dried and ground : on this kind of meal they pour boiling water, and mix it with leaven and corn-meal, where it is to be had. In spring they also take the bark of firs, which at that time comes the easiest off the trees ; but not the thick bark next the wood. Having pared off the outward coarse knots, it is dried in an oven, or placed over a wood-fire, till both sides become brown, swell, and undergo a kind of fermentation, by which the resin is consumed. These pieces of bark being thus dried, are ground, and then bread is made of the meal.

Necessity has also taught these poor people to make bread of a plant called misse, and by the Fins, wekka, called in Latin *calla soleis cordatis*, which is gathered during the spring in the morasses. After it is dried in the sun, it is baked in an oven, or half dried in a warm room, while it is sprinkled with water. It is then put into the oven a second time, and dried till the leaves fall off, and the outward tegument detaches itself at the knots from the stem ; then the stems are chopped small in a trough, and being afterwards ground, the meal is sifted and dough made of it, by pouring hot water on the meal ; it is usual to pour also some brandy lees amongst it, to give the bread a more agreeable flavour. The dough is afterwards kneaded with great labour, and then a third part of corn-meal is mixed with it.

The rest of their food consists of fish, and dried flesh. The rich, however, and the people in the great towns, are not unacquainted with delicacies ; and persons in affluent circumstances here, as in other countries, keep a good table.

Their cloathing in winter is suitable to the climate : the rich wear cloaths lined with warm furs ; instead of which those who cannot afford them, make their cloaths of sheep-skins with the wool on ; and thus, as a modern writer observes, are better provided with cloathing adapted to the season, and to their condition, than the people of most other countries.

The fashion resembles that of the Germans, and other European nations ; and, like them, they wear in summer such cloths and stuffs as they can procure ; the great adorning themselves with lace and embroidery.

The Swedish tongue has such an affinity with the Danish and Norwegian, that the inhabitants of the three kingdoms readily understand each other ; but Finland and Lapland have their respective dialects. In the times of paganism, the Swedes made use of a particular alphabet, termed Runic characters ; as appears from the Runic stones still to be seen in most of the provinces near the sepulchres of the dead.

The Swedes are of late greatly improved in arts and sciences ; but the branches of literature which they chiefly study are œconomics, natural philosophy, with the antiquities, history, and geography of their own, and other countries.

The most ancient and considerable university in Sweden is that of Upsal ; there is also one at Lund in Schonen, and another at Abo in Finland. There is likewise a royal academy of sciences at Stockholm : in the same city is a royal academy of painting and sculpture ; and another for that part of the mathematics which relate to the military art. At Drotningholm has been also lately instituted an academy for the polite arts.

Seminaries for the education of youth are instituted in ten towns of Sweden, and episcopal schools are founded at Upsal and Abo. There are inferior schools in several other places. In short, an ordinance for the improvement and regulation of the art of printing was published by his Swedish majesty in 1752, by which a new society was instituted for that purpose.

With respect to the religion of Sweden, it must be observed, that it was formerly involved in the grossest dark-

ness of idolatry, and Upsal was the seat of their superstitious worship. The emperor Charles the Great sent hither an eminent ecclesiastic, named Herbert, who preached the gospel in East Gothland; and for the same purpose the emperor Lewis sent into Sweden the famous Ansharius, who was succeeded by several others. In the middle ages the clergy had obtained the possession of several large estates, and the pope assumed a great power over the temporal concerns of the kingdom. These abuses procured Olaus Petri, a disciple of Luther, a favourable reception in Sweden, where he promulgated the pure doctrines of the gospel and that great king Gustavus Vasa happily introduced the reformation in Sweden, in spite of all the numerous difficulties he had to encounter. Indeed it afterwards met with great opposition, and underwent many trials in the reigns of John and Sigismund; yet it was at last established by the diet and synod held at Upsal in 1593, when the states of the kingdom solemnly engaged to adhere to the doctrines of Luther; and this religion, since the decree of uniformity passed in 1613, is to be esteemed both by the sovereign and his subjects, the only established church in the kingdom. Indeed in 1741, his majesty was pleased to permit by a royal edict, that the Calvinists and members of the church of England should enjoy the free exercise of their religion in all the sea-ports, except that of Carlscroon.

The hierarchy of Sweden is composed of the archbishop of Upsal, who performs the coronation ceremony, and ten bishops, with three superintendants, one of whom resides at Carlstadt, another at Hernosand, and the third in Gothland. The other ecclesiastics, who are subordinate to these, are the provosts, deacons, chaplains or curates, and the ministers or incumbents in villages.

Mr. A. Birch, in a dissertation delivered in the year 1749, observes, that in this kingdom, exclusive of the German provinces, there are in all three thousand ecclesiastical benefices, one thousand three hundred civil posts, filled by persons learned in the laws, one thousand three hundred military posts, occupied by men of literature, six hundred officers relating to the several departments belonging to the government, and two thousand six hundred physicians and surgeons.

We shall now take a view of the arts cultivated in Sweden; and here it is necessary to observe, that a few centuries ago no manufactures were established in this kingdom. The Hanse-towns not only exported unwrought iron and copper, but the ore of those metals, and when they were wrought into various tools and utensils, sold them again to the Swedes. The inhabitants of the coasts were all fishermen, and the towns had no artificers. The Swedes first began to work their metals, and even their wood, in the reign of the great Gustavus Vasa; and towards the middle of the seventeenth century began to set up all kinds of manufactures, but chiefly employed foreigners, particularly the Dutch and Flemings. In the year 1641 a glass-house was first erected in Sweden; in 1643 the Swedes began to make starch; in 1646 they erected tin-works. They had no booksellers shops till the year 1647; nor needle and silk manufactures till 1649. Leather-dressing and sope-boiling were introduced into this country in 1651; sawing-mills were erected in 1653; iron and steel manufactures in 1654; sugar-baking in 1661; but the woollen and silk manufactures flourished more than all the rest, till the wars of Charles XII. put a stop to trade, and consequently to the progress of the arts.

However, in the reign of Frederic I. trade and manufactures revived; the breeding of sheep was encouraged, tobacco planted, and foreign artists and manufacturers allowed the free exercise of their religion.

Sweden has at present manufactures of silk, cloth, cotton, fustian, and other stuffs; linen, sail-cloth, Morocco leather, dying, and printing of cottons; they have houses for boiling or refining of allum, sugar, sope, and salt; for making glass, porcelain, and paper; they have also gun-powder mills, stamping mills, boring mills, wire and flatting mills; vast quantities of copper, brass, iron, and steel are wrought in Sweden, which has founderies for great guns, pots, and the like, and forges for fire-

arms, anchors; great numbers of ships are also built, and wooden vessels and utensils made in the kingdom.

Sweden is conveniently situated for commerce, as it lies between the Baltic and the North Sea. The towns which are allowed to import and export goods in their own ships, and to trade both with natives and foreigners, are called staple-towns; these are thirty-four in number: but those that lie near the sea, and yet have no foreign commerce, and are only permitted to carry on a domestic trade, to have shares in the freight of goods, and to purchase by wholesale the goods imported by the staple-towns, are called land-towns: some of these are within land, and others sea-port-towns; others again are mine-towns. The chief staple-towns in Sweden are Stockholm and Gottenburg. At the former are held the college of commerce, an assurance-office, and the national bank, which has frequently advanced considerable sums of money for the service of the government, and has a fund of about six millions of silver dollars, each equal to one shilling and six-pence two-thirds sterling, besides current bills to the amount of seventy millions. At Gottenburg is the East India company, erected in 1731, which pays for every ship that returns from India fifty thousand silver dollars to the government: the Swedes have also a Levant company.

The exports from Sweden are iron wrought and in bars, other wrought metals, timber, gun-powder, pitch, tar, salt-petre, pot-ash, cordage, cobalt, furs, Morocco leather as it is called, and dried fish. The imports are grain, flesh, bacon, cheese, butter, tallow, wine, brandy, salt, drugs, hides, hemp, flax, silk, and several foreign manufactures.

The coins of Sweden are, the gold ducat, worth about nine shillings and four-pence sterling.

The silver coins are the oer, one of which is equal to four pfennings, twenty of them to a caroline, which is about one shilling and two-pence sterling, and thirty-two to a silver dollar, equal to one shilling and six-pence three farthings English money. There are double and half carolines; and also double, single, and half-single oers.

The copper pieces are the copper oer, which, like the rundstuc, is equal to two pfennings, and is no more than the eighth part of a penny English. An half, a quarter, and a sixth part of a copper oer. A copper dollar, which is about four groschen, and is nearly equal to six-pence farthing.

The imaginary money are the silver mark, equal to about four-pence three farthings, and the copper mark; the former is three times the value of the latter, and six silver, or eighteen copper marks, is equal to a specie dollar, or thirty-two groschen, which is about one shilling and three-pence sterling.

S E C T. III.

A general View of the History, antient and present Government, Expences, Revenues, military and naval Strength of Sweden.

SWEDEN is famous for being the native country of the fierce and warlike Goths, whose emigrations make such a distinguished figure in history. The kingdom of the Swedes was separate from that of the Goths till the twelfth century; but in 1132 both nations, with their several dependencies, were united under Suercher, king of the Ostrogoths, who was proclaimed king of the Swedes and Goths. It was afterwards agreed by both nations, that the Swedish and Gothic princes should hold the sovereignty alternately; but this occasioned many bloody intestine wars.

Magnus Smeek added Schonen and the adjacent territories to the kingdom; but at length by his mal-administration, deprived both himself and his family of the throne: for after Albert, duke of Mecklenburg, his sister's son, had been elected king, Margaret, who was heiress to the crowns of Denmark and Norway, compelled him to give up the kingdom of Sweden to her; and by the union of Calmar, in the year 1397, united the

the three northern kingdoms under one head. This union filled the Swedes with the greatest indignation: but after several unsuccessful attempts, they at length, by the assistance of a Swedish nobleman, named Gustavus Erickson von Vasa, shook off the Danish yoke. What most provoked them to engage in this revolt, was a perfidious massacre, perpetrated at Stockholm in 1520 by king Christian II.

The brave Gustavus Vasa, who had rendered himself extremely popular by the conduct and intrepidity he had shewn in rescuing Sweden from the oppression of the Danes, was elected king, and not only became the founder of a line of monarchs of his family, but advanced the royal authority to a very great height.

The crown of Sweden had hitherto been elective; but the Swedes had been deprived of this right under the Danish kings; and according to the laws of Sweden, the royal authority was so limited, that the prince had little more than the name of a sovereign; for he could neither make war nor peace, levy money nor troops, without the consent of the states. He could neither erect a fortress, introduce foreign troops, nor put any strong place into the hands of a foreigner. The revenue of the crown then solely arose from the small domains about Upsal, an easy poll-tax on the peasants, and from some fines and forfeitures which fell to the crown in criminal proceedings. The government of castles, fiefs, or manors, which were at first granted by the crown only for a term of years, or at most for life, were insensibly changed into hereditary possessions, which the nobility held by force, without paying the rents that had been reserved out of them. This was also done by the bishops and clergy, who possessed such estates on pretence that the lands of the church ought to be exempted from all duties; and by these encroachments the royal revenue was so reduced, that the king could scarce maintain more than five hundred horse. He was considered only as a kind of captain-general during a war, and as president of the senate in time of peace. The prelates and nobility fortified their castles, and rendered them the seats of so many independent states; and arming their vassals, frequently made war on each other, and sometimes on their sovereign. They neither sought nor expected redress, when they thought themselves injured, from the king's courts; but took upon themselves the power of doing themselves justice. The kingdoms of Norway and Denmark were under the like form of government, both of them were elective, and had their respective senates, without whose concurrence, or that of the states assembled in their diet, the king could transact nothing of importance.

But to return to Gustavus, who found the kingdom in this situation. The states, who thought they never could sufficiently express their gratitude to their deliverer, passed a solemn decree, by which they obliged themselves to approve whatever Gustavus should think fit to perform for the preservation of his dignity, against a pretender who was set up in opposition to him. They, in particular, impowered him to make peace and war, and resolved that the enemies of Gustavus should be esteemed the enemies of the nation.

This happened at the time that the doctrines of the reformation began to prevail in Sweden, and the Romish clergy, Gustavus's greatest enemies, being in possession of half the lands and revenues of the kingdom, and among others, of many royal castles and domains, he thought this a proper time to resume them, by falling in with the doctrines of Luther. He therefore procured an act to be passed, by which it was ordained, that the bishops should immediately surrender their castles to the king, and disband their troops: that their pretended rights to fines and forfeited estates, which originally belonged to the crown, should be entirely abrogated: that all the superfluous plate and bells belonging to the churches should be sold to pay the public debts: that all the grants of estates to the clergy since the year 1445, should be vacated, and the lands re-united to the crown: that two-thirds of the tythes, generally possessed by the bishops and abbots, should be sequestered, for maintaining the army in time of war, and for erecting and endowing public schools and hospitals in time of peace:

and that all the privileges of the clergy should be entirely at his majesty's disposal.

The king having thus obtained a legal title to the revenues of the church, marched through great part of his dominions, at the head of a body of horse, to see the act put in execution, attended by Olaus Petri, and other Lutheran doctors, whom he ordered to preach before him in the principal churches. Wherever he came, he commanded the titles and grants by which the clergy held their lands to be brought before him, and either re-united them to the crown, or restored them to the heirs of the ancient proprietors; by which means he recovered from the secular and regular clergy above two-thirds of their revenues, and seized upon near thirteen thousand considerable farms. He also caused the superfluous church plate to be melted down; and carried into the public treasury. This indeed occasioned some conspiracies and insurrections; but they were easily suppressed.

Having now succeeded so happily in suppressing his greatest enemies, he obliged the nobility and gentry who held the crown lands, which they had kept as their own, to resign up their fiefs, or to pay the rents that were originally due to the crown. Upon this they were obliged to compound with the king, and agree to pay him annually, a certain sum for all their fiefs and manors.

Gustavus next entailed the crown upon his issue, by the free consent of the states, and it has accordingly been enjoyed by his descendants ever since. But the division of the kingdom among his children, the mal-administration of his son John, with the propensity of Erick, John's brother, and his son Sigismund king of Poland to popery, threw the kingdom into terrible distractions, till they were at last composed by Charles IX. and his son Gustavus Adolphus. This last prince conquered the greatest part of Livonia, and penetrated so far into Germany as to become formidable to the emperor; but in 1632 he lost his life in the battle of Lutzen.

His daughter Christina, who succeeded to the throne, took from Norway and Denmark the territories of Jamtland and Harjedalen, with the islands of Gothland and Oeland, and in 1648 added Upper Pomerania, Bremen, Verden, and Wismar to the Swedish dominions; but in the year 1654 that princess solemnly resigned the crown of Sweden, and was very instrumental in advancing to the throne her cousin Charles Gustavus prince Palatine of Deux-Ponts, who in 1658 added Schonen, Halland, Blekingen, and the Lehn of Bohus to the Swedish dominions. His son Charles XI. re-assumed all the alienated crown-lands, and rendered himself an absolute monarch.

Charles XI. dying in 1697, in the forty-second year of his age, and the thirty-seventh of his reign, was succeeded by his only son Charles XII. who being under fifteen years of age, a regency was appointed. In the year 1700 the Poles, Danes, and Russians, taking advantage of the king's youth, endeavoured to recover the dominions of which their ancestors had been deprived. The English and Dutch sent a fleet to his assistance, and compelled the Danes to conclude a peace with him. This young prince then marched against the Russians and Poles, whom at the beginning of the war he defeated in almost every engagement, with numbers far inferior to those of his enemies, though he had well-disciplined veteran troops of Saxons to contend with, as well as Russians and Poles: but while, filled with the utmost contempt for his enemies, he busied himself in dethroning the king of Poland, the czar Peter, improving by his misfortunes, in his turn learnt to conquer: Charles was defeated at Pultowa, and his whole army entirely cut off, or made prisoners, except three or four hundred horse, with whom he escaped to Bender, in Turkey. He there gave signal proofs of his intrepidity and his folly; and, a few years after his return to Sweden, was killed at the siege of Frederichshall. His excessive fondness for war brought the kingdom to very great distress, and he was the last male heir of his family.

After Charles's death his sister Ulrica Eleanor ascended the throne, by the free election of the states; but first gave up all pretensions to arbitrary power; and in 1720, by consent of the diet, transferred the government to her husband Frederic, hereditary prince of Hesse Cassel.

King Frederic having no issue, the states in 1743 nominated Adolphus Frederic, duke of Holstein, and bishop of Eutin, his successor, who accordingly on the decease of Frederic, on the fifth of April, 1751, assumed the reins of government.

The titles of the kings of Sweden have been frequently varied. His present majesty is stiled Adolphus Frederic, by the grace of God, king of Sweden, and of the Goths and Vandals; great Prince of Finland; hereditary sovereign of Norway; duke of Sleswic, Holstein, Stormarn, and Ditmarsh; count of Oldenburg and Delmenhorst.

The arms are quarterly: in the first and fourth azure, three crowns or, for the kingdom of Sweden; in the second and third barré, ondé argent and azure, a lion rampant or, crowned gules, for Gothland; with the arms of Holstein in the escutcheon.

In 1748, Frederic I. revived two antient orders of knighthood, and founded another. The principal is the blue ribbon, or the order of Seraphim, instituted in 1334 by Magnus Smeek. The next is the yellow ribbon, or the order of the sword, founded by Gustavus Vasa in 1523. The order of the black ribbon, or the north star, is of late institution. All three have their proper badges and mottos.

The present form of government was settled in Sweden in the year 1720, by which the king's male issue are declared his heirs and successors to the throne; but before the new sovereign enters on the administration of the government, he renounces by a solemn oath all claim to arbitrary power, and engages to punish with the utmost rigour all who shall endeavour to promote it, as traitors and enemies to the king and kingdom. The king cannot appropriate to himself or alienate any of the national revenues: he cannot settle any of the royal domains on his children, but must supply the necessary sums for their education and portions in ready money: he must be of the Lutheran religion: he is to govern in concert with the council of state, according to the general laws of Sweden, and the present form of government: he is not to engage in any war, to impose any new taxes, to alter the value of the current coin, to detain the salaries or pensions accruing to the officers and soldiers from the crown lands, nor to annul any ordinances made for the improvement of navigation, trade, and manufactures, without the consent of his council and the states of the kingdom.

The states, according to the antient form of government, consist of four orders. The first of these is the nobility, consisting of counts, barons, and gentry. One is chosen out of each family to represent that body, and with them the colonels, lieutenant-colonels, majors, and captains of every regiment, sit and vote.

The second order is composed of the representatives of the clergy, who chuse one out of every rural deanery, consisting of ten parishes, and their charges are borne. These, with the bishops and superintendants, make about two hundred, who represent that body.

The third order of the state consists of the representatives of the burghers, who are chosen by the magistrates and common-council of every corporation. Of these there are four elected for Stockholm. Some of the towns have two votes; but most of them have only one. These members amount to about a hundred and fifty in the whole.

The fourth order consists of the peasants, who choose one out of every district, whose charges they bear, and these amount to about two hundred and fifty.

The king is obliged to convene a diet once in three years; but if he dies without leaving a male heir to the crown, the states meet of themselves. Each of the four classes has its chairman; the marshal of the diet is usually the chairman of the nobles, and the archbishop of Upsal that of the clergy: the burghers usually choose one of the burgomasters of Stockholm, and the peasants have also their speaker; but the counsellors of state have no vote in the diet. Each of the four classes has also its respective house at Stockholm.

When they assemble they first meet in a large room in the king's palace, called the diet-chamber; where his majesty being seated on his throne, and the senators or

privy-counsellors sitting at some distance from him, the president of the chancery usually compliments the assembly in the king's name; after which a secretary acquaints them with the state of affairs since their recess, and the reason of requiring their advice and assistance; to which the marshal of the nobility returns an answer; and after him the archbishop for the clergy, and the speakers of the other orders of the state. They then separate to their several houses or chambers, where they choose a secret committee, composed of an equal number of each body, to whom the ministry communicate such particulars as are not thought proper to be made public, and they prepare what is to be proposed to their respective bodies. In each house affairs are determined by a majority of voices; and a majority in all the chambers is necessary to the passing of every act. When the particulars proposed by the king have been considered and dispatched, each house offers its grievances separately to his majesty, to which he returns an answer; and each member of the three inferior houses has a copy of the king's answer to their respective grievances, and of all the acts passed by the states; both of which they communicate to their electors.

We shall now give an account of the senate, and the several courts or colleges for the administration of public affairs. These are,

The senate, the council of state, or supreme council, in which the king himself presides, and has two votes. Here all national affairs that admit of no delay are determined by a majority of voices. This council consists only of fourteen members, who are chosen in the following manner: twenty-four of the nobility, or house of lords, twelve of the clergy, and as many of the burgeses being assembled, take an oath of secrecy, after which they proceed to chuse three persons fit to be advanced to that dignity, on a vacancy, in which they must be unanimous. Of these his majesty chooses which he pleases. No senator can be elected in the intervals of their diet; nor may more than two of one family be of the senate at the same time.

The royal courts of justice, of which the Swedish properly so called is held at Stockholm, the Gothic at Jonkoping, and that of Finland at Abo.

The royal war-office has a senator for president, and two others of the same dignity for his associates, with a general of the artillery, a quarter-master-general, and two counsellors of war, under whose direction are all the land-forces, the artillery, and fortifications. Under this office are the commissary of war's, the ordnance, and pay-master's-offices; those of the militia, the fortifications, stores, camp, cloathing, quarters, &c.

The court of admiralty, which is held at Carlscroon, has an admiral for its president, with all the other admirals and principal sea-officers for his assistants.

The state-office, in which the prime minister resides. As this office has the care of the records of the kingdom, the secretary of state is a member of it.

The royal chamber of finances.

The royal domain chamber.

The royal chamber of revision.

The royal college of commerce.

The royal chancery.

The office of the states, and the manufacture-office.

Foreigners are excluded from all posts in the government.

With respect to the laws of Sweden, the new Swedish digest was allowed of by all the states in the diets held in 1731 and 1734, and was confirmed by the king, and published in 1736. It contains a new course of proceedings, by which all law-suits are easily determined and brought to a speedy issue. The towns and districts of the peasants have their inferior courts, from which an appeal lies to the superior or provincial courts, and from these again to the royal courts of justice. In the village courts of judicature twelve peasants always sit as assistants in trying causes.

The punishment of theft in Sweden is perpetual slavery; the criminal being condemned to labour all his life in the service of the crown, in carrying wood and stone for the repair of the fortifications, or other servile and laborious employment. He wears an iron collar night and day

about his neck, to which a bow of the same metal is fastened that comes over his head, and has a little bell that rings upon the least motion.

Duelling, where one of the parties is slain, is punished with the death of the survivor; and if neither of them fall, they both suffer two years imprisonment, during which they are to live upon bread and water, and also pay a fine.

For murder, adultery, and burning of houses, the criminal, if a man, is hanged; and if a woman, beheaded: but where the facts are attended with aggravating circumstances, the offender is hung in chains, burnt, or quartered. Where a nobleman or gentleman commits a capital crime, he is shot to death.

We shall now consider the expences, revenues, military and naval forces of Sweden. The ordinary and extraordinary expences for the kingdom of Sweden, and the great dutchy of Finland, for the year 1753, amounted to ten millions two hundred and forty thousand four hundred and thirty-four silver dollars; but the ordinary revenue of the kingdom does not exceed eight millions seven hundred and forty-five thousand seven hundred and eleven, including the sum allowed to the king for his civil list. The usual grant to the king for his privy purse is about two hundred thousand silver dollars; to the queen a hundred thousand; to the princess and princesses, the children of the reigning monarch, thirty thousand. The crown debts are so great, that since the year 1753 the annual interest of them has amounted to one million twenty-eight thousand two hundred and eighty-six silver dollars.

The military forces of Sweden consist partly of raised and partly of distributed regiments. The latter, which are the national militia, form the greatest part, and, according to an ordinance published by Charles XI. are maintained by the country; for that prince obliged the nobility and gentry, as well as the peasants, to provide and maintain both horse and foot, of which each province furnishes its contingency.

As to the infantry, every three farmers provide a foot-soldier, furnish pay, and give him a dwelling and a piece of land; but he has his accoutrements, arms, and ammunition from the crown, which also pays the principal and subaltern officers, and supplies the troops with provision when they are on their march, or in the field, except at the rendezvous, in order to be mustered.

The officers of horse and foot are maintained out of the lands resumed and reunited to the crown. Every officer has a house and land assigned him in that part of the country where his regiment is quartered, and the rent of other farms to the value of his pay, which they receive either in money, corn, or other goods. The lands assigned for the payment of a colonel of foot are about three hundred pounds a year, and the rest of the officers in proportion. But on a march, or in the field, the crown furnishes them with subsistence, and provides ammunition and forage for their horses.

The raised regiments of infantry, most of which serve as garrisons in the fortified places, consist of the king's life-guards, which amount to thirteen thousand eight hundred men; a regiment of artillery, consisting of three thousand; and the distributed regiments, which amount to twenty-four thousand two hundred and thirty-eight. Hence the whole body of the infantry amount to forty-one thousand and thirty-eight. The cavalry, including the king's regiment of life-guards, amounts to seven thousand and twenty-six; besides three regiments and one squadron of dragoons, amounting together to three thousand one hundred and fifty-four. Hence it appears that the whole army consists of fifty-one thousand two hundred and eighteen men: but in time of war several extraordinary regiments are raised, which amount to at least an equal number.

A college of invalids is founded at Wadstena for twenty-eight field-officers, nineteen subaltern officers, and twenty-two private men, who are there provided with lodging, firing, provisions, and cloaths: besides these above five hundred field officers, five hundred and fifty subalterns, and four thousand private men have pensions, and some other small gratuities.

The Swedish navy consists of twenty-four ships of war, from the first to the sixth rates, carrying from a hundred

to forty-two guns; twelve frigates, carrying from thirty-six to twelve guns; four brigantines, carrying from eight to six guns; with several bomb-ketches, and forty galleys.

Sweden at present consists of five great divisions, or general provinces; Finland, Gothland, Sweden properly so called, Nordland, and Lapland.

S E C T. IV.

Of Finland, its Situation, Extent, and Produce. A Description of its several Provinces, and of the principal Places in each.

IN describing the provinces of Sweden we shall begin with the easternmost part. Finland, called by the natives Suomi, is bounded on the east by Russia, on the south by the gulph of Finland, on the west by the gulph of Bothnia, and on the north by a part of Swedish Lapland. This country contains about eighteen thousand square English miles, and is naturally fertile; but it is far from being properly cultivated or sufficiently peopled according to its extent.

The pastures of Finland are in many places so rich, that the inhabitants obtain great profit by grazing; but the breed of cattle is here very small. Here are considerable woods of pine-trees; so that vast quantities of timber, boards, and charcoal, are sent from hence to Stockholm for exportation. It produces several sorts of fruit, as pears, apples, plums, and cherries; and abounds with all sorts of game.

Finland is every where watered with lakes, rivers, and brooks, which yield plenty of fish, and fine pearls are found in the pearl-fisheries. Lead ore is found in several parts of this province, and in the lakes and morasses are dug up a ferruginous earth, from which iron is extracted. Finland is divided into five provinces, of each of which we shall give some account.

We shall begin with Finland Proper, which is situated at the angle where the gulphs of Bothnia and Finland join, and is about a hundred and seventy-four English miles in length, and a hundred and eight in breadth. The soil is very fertile, and the country yields very delightful prospects, especially in the southern parts, where it is agreeably diversified with lakes, rivers, corn-fields, pastures, hop-grounds, woods, and some iron works; but the north part of Finland is not so well cultivated. The fief of Biorneborg is one of the most fertile parts in all Finland; and here is a rich pearl-fishery, where pearls of an extraordinary size are found, for the most part single; but sometimes a cluster of two or three pearls are found in the same shell. The inhabitants of this country subsist by grazing, agriculture, fishing, and making of wooden-ware; and traffic in grain, meal, cotton, butter, talc, yarn stockings, and linen.

The principal places in Finland Proper are,

Abo, in Latin Aboa, is seated on the river Aurojocki, which runs through the city. It stands on the point of the angle formed by the gulph of Bothnia and Finland, has a commodious harbour, and is the most considerable staple town in the whole country. It is situated in sixty degrees forty minutes north latitude, and in twenty-one degrees twenty-eight minutes east longitude, and is almost surrounded with hills. The cathedral, which was built in 1390, is a handsome structure. King Gustavus Adolphus founded a seminary here, which queen Christina afterwards converted into an academy. A royal high court of judicature, which is the only one in Finland, is held at Abo, where the governor of the province also resides. The chief magistrates are two burgo-masters. The city carries on a brisk trade in corn, provisions, linen, planks, &c. The Russians, who were in possession of this place from the year 1713 to 1720, committed great ravages here. It has also frequently suffered by fire. In the year 1743 a peace was concluded in this city between Sweden and Russia. Abo castle is one of the most antient fortifications in Finland; it is seated on a peninsula at the mouth of the river Aura, and has been several times destroyed by the enemy, and consumed by fire.

At the distance of nine English miles from Abo is Nadendahl, in Latin Vallis Gratiae. A convent which occasioned the building of this town, was sequestered at the Reformation, the nuns, however, continued there till the year 1595, and set up a manufactory of knit stockings, which still continues to flourish, and several hundred pairs of thread stockings are annually sold at a very low rate, and sent from hence to Stockholm and other places. Near the town is a fine medicinal spring.

Biorneborg is a sea-port town, situated in the sixty-second degree of north latitude, on a narrow sandy tract of ground on the bank of the river Kumo, which, just below the town, divides itself into several branches, forming many small islands within the distance of three miles. Great quantities of wooden-ware and fish, particularly salmon and large whittings, are exported from hence to Stockholm and other places. The quay belonging to this town is at Sandud, which is at about six miles distance.

Between the island of Aland and Finland are many small islands, shelves, and rocks, which render that part of the sea very dangerous to mariners. Aland is situated in the sixty-first degree five minutes north latitude; it is about thirty-six miles in length, and near as many in breadth. The soil is so fertile, that the inhabitants seldom experience any scarcity of corn. It also produces rich pastures for grazing. The woods belong to the king, and are every where enclosed. In different parts of the island are quarries of lime-stone; and lynxes, foxes, and hares abound here; but bears are not very common. The inhabitants, who speak the Swedish dialect, chiefly subsist by agriculture, grazing, fishing, hunting, catching of sea-fowl, and working in the woods. They also trade in butter, wooden-ware, coals, and lime; and some of them are good mariners. The clergy of this island are under the jurisdiction of the bishop of Abo.

The next province of Finland we shall mention is that of East Bothnia, which lies farther north on the sea-coast, and obtained its name from its being situated on the east side of the gulph of Bothnia. Nature has separated it from the adjacent countries by a chain of hills, which run along the east side of it; and from these eminences issue several rivers. The country, especially on the sea-coast towards the south, is for the most part level, but full of morasses. The industry of the inhabitants in agriculture is attended with good success, so that they supply other places with corn; but their hopes of a good crop are sometimes frustrated by an unexpected frost. However, some large tracts of land lie uncultivated. East Bothnia abounds in woods, and with lakes and rivers that yield plenty of fish; and in some of the rivers are found pearls. The inhabitants subsist chiefly by agriculture, grazing, burning lime and tiles, and in making tar. Of the last they annually extract fifty thousand barrels. They also employ themselves in hunting and fishing, ship-building, and making of wooden-ware. The commodities exported from hence are beams, planks, tar, train oil, cattle, fish, and other provisions.

All the parishes in this province amount only to nineteen inhabited by Fins, and nine by the Swedes. The number of the inhabitants is computed at eighty thousand.

East Bothnia is divided into three parts, all under one governor; the principal places in which are,

Ulea, or Ulaborg, a sea-port town, situated on a peninsula at the mouth of the river Ulea-Elf, in the sixty-fifth degree twenty minutes latitude, and is the largest town in all East Bothnia. It has very straight and long streets, a good school, a commodious harbour, and a fine salmon fishery. In the year 1714 it was demolished by the Russians. The castle which stands near it on a small island, is said to be at present in a ruinous condition.

Gamla-Carleby, in Latin Carolina-Antiqua, was built in the reign of Gustavus Adolphus, in a fertile and pleasant country, in the sixty-fourth degree eight minutes north latitude. It has a commodious harbour, and the inhabitants not only carry on a considerable trade in tar, but make great advantages by ship-building. The adjacent country is famous for a particular kind of salt,

which the peasants boil from the sea-water in spring and autumn. At first it is of a dirty grey colour; but upon pouring some sour milk into the clarifying vessel, it becomes as white as snow.

The province of Tavastland, in Latin Tavastia, lies in the middle of Finland, and is a hundred and eighty miles in length, and a hundred and twenty in breadth. The country, which is very fertile, consists of fine plains, watered by a great number of lakes and rivers that abound with fish, and is diversified with meadow and arable lands; and with respect to these natural advantages, it is scarce surpassed by any province in Sweden. It is also stored with cattle, and all sorts of game: but it is far from being well cultivated, and consequently the peasants are generally poor. The inhabitants subsist by agriculture, grazing, and breeding of cattle, and some of them are employed in the fisheries. They also trade in corn, peas, beans, butter, cattle, leather, dried fish, tallow, flax, hemp, lime, and the bark of trees.

One of the most remarkable places in this province is Croneburg, or Tavastehus, in Latin Croneburgum, a small town built in 1650, on a pleasant spot, and endowed with considerable privileges. This town, which is situated in the sixty-first degree twenty-five minutes latitude, was taken by the Russians in 1713, and in the last war between them and the Swedes it was laid in ashes. The castle, which, exclusive of the town, is properly called Tavastehus, or Tavasteburg, is well fortified, and serves for an arsenal and royal magazine.

The province of Nyland, in Latin Nylandia, lies in a bay of the gulf of Finland, and was formerly peopled by the Fins; but is now inhabited by the Swedes. It is near a hundred and twenty-eight miles in length, and in few places more than thirty in breadth. It is a level, fertile, and pleasant country, better peopled and cultivated than the neighbouring provinces. It consists of arable and excellent pastures, woods, rivers and lakes that abound with fish, and is well stored with all sorts of game. Here are also some sawing-mills and iron-founderies. The inhabitants subsist by agriculture, grazing, and fishing, and trade in corn, planks, linen, and dried fish.

The principal towns in this province are,

Helsingfors, in Latin Helsingforsa, a staple-town, and the best in the province, is seated on a peninsula, on the south coast, and has a good harbour, not inferior to any in Sweden. This town was built by Gustavus I. but in the late wars was laid in ashes, and has not yet recovered its former flourishing state. The governor of Nyland and Tavastland resides in this town, and within these few years several forts have been built in its neighbourhood.

Borgo, in Latin Borga, an ancient sea-port, with an indifferent harbour. This town was almost entirely demolished in the late war; but is now in a very flourishing condition. It is a bishop's see, and has a good seminary. The inhabitants trade in all kinds of linen.

Degerby, or Louisa, is a well-built staple-town on a creek of the gulf of Finland, and has a commodious harbour. It was built in 1745 as a frontier town towards the Russian territories, according to the limits settled by the last treaty of peace, and was called Degerby from the nobleman's estate on which it stands; but in 1752 king Adolphus Frederic changed its name to that of Louisa.

Besides the above five provinces, Finland contains the country of Sawolax, which is two hundred and four miles in length, and a hundred and twenty-six in breadth, but produces very little corn or pasture, it mostly consisting of woods, lakes, rivers, and morasses. The land is so unequally divided, and so thinly inhabited, that the grounds belonging to some farms, lie above sixty miles from the house. The inhabitants, however, get a tolerable subsistence by sowing buck-wheat, grazing, hunting, fishing and making wooden-ware. They also trade in tallow, butter, dried fish, hides, and furs. The country abounds in elks and rein-deer; but contains no towns worthy of notice.

S E C T. V.

Of Gothland in general; its great Divisions; with a particular Account of them; and their several Provinces, Islands, and Towns.

GOTHLAND is bounded on the east and south by the Baltic; on the west by Norway, the Sound, and the German ocean; and on the north by Sweden Proper. It is a pleasant and fertile country, consisting of fine plains and enclosures, and the greatest part of the corn of the growth of Sweden is produced here. It also abounds in lakes and rivers, which yield great quantities of fish, and in extensive forests and rich mines.

Gothland had anciently its own sovereigns; but Suercher, king of the Ostrogoths, being proclaimed king of the Swedes and Goths in 1132, both these kingdoms became united under one sovereign. The arms of Gothland are azure, a lion rampant going over three streams; by which the Goths probably intended to denote their warlike prowess, and the success of their arms in three countries of Europe.

The number of towns in Gothland amount to forty-eight, and it is divided into East Gothland, West Gothland, and South Gothland.

East Gothland, in Latin Ostro-Gothia, properly so called, includes Smaland, with the islands Oeland and Gothland. This country, which had formerly its particular kings and its own laws, is ninety-six miles in length, and ninety in breadth, and produces wheat, rye, barley, oats, and peas in such plenty as to supply the neighbouring provinces. It has also many fine orchards, meadows, and pastures, with lakes and rivers abounding with variety of fish, extensive forests, some of which are of oak and birch, and valuable iron mines. The inhabitants are employed in agriculture, grazing, hunting, fishing, and in the mines and quarries. Along the banks of the lake of Wetter are found agate, cornelians, touch-stone, and rattle-stones. In the forest of Kalmar-den are dug up fine marble, and a reddish violet-stone which emits a very fragrant smell. Antimony is found in mount Amberg, and beautiful petrifications in several parts of the country.

There are twenty-three lakes in East Gothland, the most remarkable of which is the Wetter, which extends ninety miles in length, and fifteen in breadth, and contains two or three islands. It has but one outlet, which is by the river Motala, though above forty little streams discharge themselves into it. This lake is said to lie above a hundred feet higher than either the Baltic or the North Sea, and is deep and clear, but very boisterous in winter.

The rivers of East Gothland are the Motala, just mentioned, which receives seventeen rivulets, and passing through the whole country discharges itself into the Baltic; near Norkioping it precipitates its waters from a rock sixteen fathoms high: the Stang, which divides the country into the east and west parts, and discharges itself into the lake of Roxen: the Molby or Nibro, the Karesbo, and the Skena.

East Gothland consists of one diocese, which is that of Linkioping; the second in Sweden as to precedence. It includes twenty-two provostships, and is divided into twenty-one districts, which belong to the prefecture of Linkioping.

The principal place in East Gothland is Norkioping, in Latin Norcopia, a staple-town situated on the river Motala. It is next to Stockholm in extent, and is esteemed one of the best cities in the kingdom. It was destroyed by the Russians, but has recovered itself, and contains five churches, has a new and commodious quay, and carries on a considerable trade. Here are paper mills, copper mills, a printing-house, and woollen manufactures.

The country of Smaland, or Smoland, is a hundred and twenty miles in length, and seventy-two in breadth, and was antiently governed by its own kings. It probably received the name of Smaland, or small parcels of land, because in antient times the country was so overrun with woods and barren wastes, that the inhabitants

could only cultivate a few spots here and there between them; and even to this day are seen large heaps of stones in the woods, which were thrown together by the first inhabitants, in order to clear the ground. Though Smaland is mountainous, those parts which are cultivated are very fruitful, and it is particularly remarkable for its fine pastures. Here are large forests of beech and other trees. A vein of gold has been discovered in this province, and there are also mines of silver, copper, and iron, and even a great quantity of the latter is found at the bottom of the lakes.

The high mountain of Hunsberg resembles a cone, and may be seen at the distance of eight Swedish miles. The inhabitants obtain a comfortable subsistence by agriculture, grazing, and the mines. They also deal in cattle, butter, cheese, flesh, bacon, tallow, fish, hops, beans, planks, masts, tar, pot-ash, iron, and grain.

In this province are twenty-one lakes, which afford nothing remarkable, and ten rivers, the principal of which are the Emma, the Nissa, the Laga, and the Helgea.

Smaland consists of two dioceses, that of Wexio, and that of Calmar, and contains three prefectures, which include twenty-four districts, the most remarkable places in which are,

Calmar, in Latin Calmaria, is seated in the prefecture of the same name on the main sea, opposite to the isle of Oeland, in the fifty-sixth degree forty minutes latitude, and in the sixteenth degree four minutes east longitude. It is a fine staple city, and one of the oldest in Gothland: it is nearly of a circular form, and has fine regular streets, in which are about five hundred houses. It is surrounded on the land side by four walls and moats; but has only one wall towards the sea. At the distance of a mile and a half from the town, stands the strong fort of Grimskiar, and towards the north is another fort on the island of Karinglaret. Calmar castle stands near the Sound, or streight, opposite to the city; it has two ditches, and is so well fortified, that it has been generally considered as the strongest and most important fortress on the frontiers. The prefect or governor resides in the royal palace of Hofmo, near the city; here are also a bishop's palace, a fine cathedral, a commodious quay for shipping, and a seminary, and it has good manufactories of cloths and woollen stuffs. The Sound, which runs between the castle and the island of Oeland, is called Calmar-Sound, and is about six miles over. In this city the famous union of Calmar was concluded between the three northern kingdoms.

Jonkioping, in Latin Junecopia, is a very ancient staple-town, in the prefecture of the same name, situated on a peninsula between the lakes of Wetter, Monk, and Rock. This town formerly stood in another place; but the inhabitants were removed hither in the reign of Gustavus Adolphus. The suburbs on both sides are separated from the town by a canal that conveys water out of the lake of Lill into that of Rock. There are here three churches, an armoury, an elaboratory, and an arsenal belonging to the crown: fire-arms are also made here. The supreme court of justice for Gothland is held in this town, and ten provincial with forty-eight inferior courts are under its jurisdiction.

Wexio, in Latin Wexionia, is seated in the prefecture of Cronoberg, almost in the center of the province, and is the residence of the prefect or governor. In the year 1570, this town was reduced to ashes by the Danes. A seminary was founded here in 1648; but the library and cathedral, which was above nine-hundred years old, and in which St. Siegfried, its founder, was interred, were destroyed by fire in 1740.

About twelve miles from this city is Browalla heath, famous for being the place where the Danes were totally defeated by the heroic Blenda, who commanded the Smaland women in the absence of their husbands, that were engaged in another expedition. As a recompence for their bravery, the women of Smaland were honoured with extraordinary privileges, and distinguished by their wearing a kind of martial head-dress: they have even still an equal share with the men in inheritances.

The pleasant island of Oeland, called in Latin Oelandia, lies in the Baltic, directly opposite to the Calmar-Sound.

Sound. It is eighty-four miles in length, and but nine broad in the widest place. It is divided into the north and south parts: in the former are several fine forests, and many quarries of stone; but in the latter the ground being more level, is fit both for pasture and tillage. The island in general yields plenty of honey, wax, butter, and nuts. The Oeland horses are small, but strong, and full of mettle. Here are also a multitude of deer of several kinds, as likewise hares and wild boars. The king's forest extends over the whole island. Both parts of Oeland abound in allum-mines, black marble, and free-stone, remarkable for its hardness. The inhabitants are said to exceed seven thousand persons, who are employed in agriculture, working in the quarries, cutting stone, burning lime, fishing, and navigation.

In the north part of the island is Borgholm, a stately royal seat well fortified, though it has been several times taken by the Danes; but the Swedes have always insisted on its being given up to them by treaties. Near it is the commodious harbour of Borga.

In the province of East Gothland is also the island of Gothland, or Gottland, in Latin Gottlandia, which is situated in the Baltic, and is about a hundred and eight miles in length, though but from thirty to thirty-six in breadth. From its convenient situation it acquired the name of the Eye of the Baltic. It was formerly governed by its own kings, and had its peculiar laws and privileges; but is at present subject to the supreme court of justice at Stockholm. It is said to have obtained its name from its having been the winter-quarters of the Goths, when they put to sea on naval expeditions.

As the soil is fertile, it has good pastures, fine woods of oaks and pines, as well as profitable fisheries. It has large quarries of stone of different kinds fit for building. Here are also several curious species of stone, corals, cornelians, agates, and beautiful petrifications.

The inhabitants subsist by agriculture, grazing, fishing, burning lime, working in the quarries, navigation, and several sorts of mechanic trades. The peasants sell none of their commodities to the inhabitants of the towns; but when one of them, says Dr. Busching, comes to market, the burgher to whom he applies, furnishes him with all necessaries, and gives him money to enable him to pay his taxes; while the peasant, on the other hand, delivers up to the burgher all the produce of his industry, without mentioning a word about the price, both parties proceeding according to the dictates of natural justice and equity.

This island is divided into three parts, namely, the North, Middle, and South part; the first of which contains seven, the second six, and the third seven districts; but the only town worthy of notice is

Wibby, a very ancient staple city, which in former times was one of the Hanse-towns, and was frequently visited by the Swedes, Goths, Danes, Normans, French, English, Saxons, Livonians, Spaniards, Russians, Greeks, and other nations. In times of popery there were three churches and five convents within the city, besides two within the walls. The maritime laws of Wibby were famous in all parts, and adopted along the coast of the Baltic. Wibby is the residence of the superintendant and prefect; it has a church and school; its harbour is safe and commodious, and the town is in a pretty flourishing condition.

We now come to West Gothland, which contains four provinces, West Gothland properly so called, Warmeland, Daland, or the Vale Country, and Bohus-Lehn.

West Gothland properly so called, lies below the lake of Wener, and is a hundred and twenty miles in length, and ninety-six in breadth. It was antiently governed by its own kings, and had its particular laws and privileges. The pastures are so rich, that the inhabitants are able to supply other parts with butter and cheese; the last of which is much admired. The country also produces corn, fruit-trees, and vegetables; and here likewise are iron and allum works.

The lake of Wener, or Vener, is eighty-four miles in length, and forty-two in breadth; it ebbs and flows in a very extraordinary manner, is stored with great plenty of fish, and has several islands. Twenty-four rivers dis-

charge themselves into it, yet none flows out of it, but the large river called Gotha-Elbe.

The Gotha-Elbe, or Gothic river, discharges itself into the North Sea near Gottenburg. About forty-five miles from its mouth is the remarkable cataract of Trolhatta, where the water is precipitated between two rocks; it consists of three cascades, each of them about five fathoms high, and about three hundred fathoms from each other. At the distance of three miles from this cataract is a bridge, built from one rock to another, over another high cataract formed by this river, at the bottom of which great number of salmon are caught; and twelve miles lower down is another water-fall, where the boats and other vessels pass through three sluices.

The other rivers in West Gothland are the Halle and the Gullspang, which last divides East Gothland from Warmeland.

West Gothland is divided into two dioceses, that of Skara, and that of Gottenburg. The former is the third in rank, and includes fifteen provostships; the latter is the tenth in rank, and contains nine provostships. The most considerable town in West Gothland Proper is,

Gottenburg, in Latin Gothoburgum, a staple-town, first built in 1607 by Charles IX. on the island of Hisingen; but being destroyed by the Danes in 1611, the inhabitants, about seven years after, removed to the place where the town now stands, and were favoured with several considerable privileges. Gottenburg carries on the greatest trade of any city in Sweden, except Stockholm. It is situated on the borders of West Gothland, at the mouth of the river Moludal, which runs close by the north side of the city, and is conveyed through it by several canals. The streets are broad and kept very clean, and since the year 1746 the greatest part of the houses have been rebuilt with stone. It is regularly fortified, and on the land-side is defended by two citadels, called the Lion and the Crown; and towards the sea by the citadel of New Elfsburg. The governor of the prefectures of Gottenburg and Bohus, who is also commandant of the forts and fortifications, resides in the city. Gottenburg is a bishop's see, and has two printing-houses, a city church, a seminary, an orphan-house, an edifice called the crown-house, where the garrison attend divine service, a German church, and several quays and docks. The number of inhabitants is said to amount to thirteen thousand. In 1731 an East India company was established in this city, for the harbour is a very fine one, and is resorted to by a great number of ships: there is here also a college of admiralty and a court of appeals. It is situated in fifty-eight degrees twenty-nine minutes north latitude, and in eleven degrees thirty-six minutes east longitude.

The province of Warmeland forms a semicircle round the north part of the lake of Wener, and is about two hundred and ten miles in length, and a hundred and fourteen in breadth. It is said to derive its name from the Gothic word Wara, which signifies to defend; the inhabitants of this country having bravely defended it from the incursions of their enemies.

Warmeland is very mountainous; but the south and east parts are most level and fertile; yet the woods and mines of silver, lead, copper, and iron, with the forgeries and founderies on the west and north, furnish a great variety of employments for the inhabitants. In the year 1726 some pure silver was found in an iron mine near Philipstadt, and the memory of this extraordinary circumstance has been preserved by some medals being struck on the occasion.

One of the principal towns in this province is Carlstadt, an inland town, built by duke Charles on the island of Tingwalla, where the Clara falls into the lake of Wener. It stands on a commodious situation, has about eight hundred inhabitants, a superintendant, a school founded by king Charles XI. a woollen manufacture, a good metal weigh-house, from which great quantities of iron and copper are exported, and the town carries on a considerable trade.

Daland, or Thalland, or the vale country of West Gothland, derives its name from the great number of vallies it contains. It lies between the lake of Wener and

and Bohus-Lehn, and is sixty miles in length, and thirty-five in breadth. The greatest part of the province is covered with rocks and mountains; but the plains and valleys that lie between them are so fruitful, as to supply the country with plenty of grain. The inhabitants chiefly subsist by grazing, breeding of sheep, agriculture, fishing, and working in the mines. They also carry on a considerable trade in masts, deal-planks, tar, horses, oxen, sheep, bacon, butter, and cheese. The principal town in this province is,

Amal, which is situated on the lake of Wener, and divides the town and market-place into two parts. This town has a metal weigh-house, and carries on a considerable trade, particularly in timber, deals, and tar.

The government of Bohus-Lehn is bounded on one side by the North Sea, and on the other by the vale country of West Gothland, extending a hundred and twenty-six miles in length, and between eighteen and twenty-four in breadth. The country is in general level, and the soil, which is fertile, consists of fine meadows and arable land, diversified with woods, lakes, and rivers; but there are some mountains in which are large cavities that resemble spacious apartments, and are called the caves of the giants. There is also a high mountain, which chiefly consists of a kind of shells that are dug up and calcined for making lime. The inhabitants are chiefly employed in agriculture, grazing, and fishing. They also carry on a trade in masts, planks, deals, tar, cattle, hides, tallow, lime, and all kinds of fish. This country is in the diocese of Gottenburg.

We now come to South Gothland, which consists of the three provinces Schonen, Halland, and Blekingen.

The province of Schonen was in antient times governed by its own kings, and had its particular laws. If measured according to the roads, it is eighty-four miles in length, and about sixty-six in breadth. It is the most level, pleasant, and fertile spot in all Sweden, and produces plenty of rye, barley, oats, buck-wheat, pease, cummin-seed, and honey; also pit-coal, chalk, tiles, and pot-ash, of which ten thousand tons are annually exported from hence. The inhabitants likewise carry on a considerable trade in mill-stones, oak, timber, cordage, fish of several kinds, fine horses, sheep, and horned cattle. All the animals are larger in Schonen than in the northern parts of Sweden; but are less vigorous. Allum, sulphur, and amber, are also found here. This country, with regard to its many advantages, may be called the store-house and granary of Sweden. It contains more well-built towns, and finer seats belonging to the noblemen, than any other province in Sweden. The number of its inhabitants are computed at above six hundred thousand persons.

The principal places in this province are,

Lunden, in Latin Lunda Gothorum, a very antient city, an archbishop's see, and formerly the place where the kings of this country resided. It is said to have contained in the times of popery twenty-three churches, and at least as many convents. Its cathedral, which is dedicated to St. Lawrence, is an antient stately building, and has a superb altar, and a pulpit of alabaster and black marble. Authors have mentioned, as the greatest curiosity in this church, a very curious clock, which not only shews the hour, day, month, and year, together with all the festivals; but every hour two horsemen come forth, and encounter each other, giving the same number of blows that the hammer strikes upon the bell: then a door opening discovers the Virgin Mary sitting on a throne, with the infant Jesus in her arms, and the wise-men paying their homage to him, two trumpeters sounding all the while. Within this cathedral is a fine well, with which all the other wells in the city have a communication. The city has an university founded by Charles XI. whence it is stiled Academia Carolina Gothorum: it has since received the addition of a very elegant anatomical theatre; and has also a physic-garden. The bishop of the see is vice-chancellor of the university. The inhabitants of the city are chiefly employed in agriculture. In its neighbourhood are several good tobacco plantations, which nearly produce a hundred and sixty

thousand pounds weight annually. Above twenty thousand mulberry-trees have also been lately planted in the neighbourhood of this city. In 1679 king Charles XI. entirely defeated the Danes near this place, and in 1679 a peace was concluded here between the two kingdoms. It stands in latitude fifty-five degrees forty-one minutes six seconds.

Christianstadt is situated on the river Helgea, by which it is encompassed on three sides, in the latitude of fifty-six degrees one minute twenty seconds. This town was originally built in 1614 by Christian IV. king of Denmark, from whom it received its name. It has a handsome church, a good school, and a strong bridge, on which several warehouses are built. It has manufactures of silk, woollen, and linen cloth, and carries on a considerable trade. It is fortified with walls and horn-works; but the castle, which stands near the church, has nothing worthy of notice. In 1676 the Danes made themselves masters of this town, but the very next year Charles XI. retook it sword in hand.

Ween, in Latin Hevona, is a fertile island in the Sound, about eight thousand one hundred and sixty paces in circumference, and at a distance appears like a high mountain. By the treaty of Roschild, in 1658, it was annexed to the crown of Sweden. This island was rendered famous by its being granted to the celebrated astronomer Tycho Brahe, together with a fief in Norway, and some other lands by Frederic II. king of Denmark, who caused an elegant seat to be built for him at a very considerable expence. This structure, which is called Uranienburg, is sixty feet square, and seventy feet high. It has two towers designed for observatories, and two others which are not so high, but yield an extensive prospect, and it has also a delightful garden. However, the malice of Tycho's enemies deprived him of these enjoyments; he was obliged to leave Uranienburg in 1597, and died in Germany in 1601. His celestial globe, which was six feet in diameter, and is said to have cost him five thousand dollars, was carried from hence to Benadky, in Bohemia, and soon after it was removed to Prague, from whence it was conveyed to Neisse, in Silesia; but that town being taken in 1632, this curious machine was removed to Copenhagen, and deposited in the round tower, where it was entirely destroyed in 1728 by the dreadful fire which laid great part of that flourishing city in ashes. All the other valuable mathematical instruments and curious machines belonging to that celebrated astronomer have likewise been gradually lost, and his favourite Uranienburg now lies in ruins. In the whole island is but one village, which consists of fifty or sixty houses, and a church.

The province of Halland, which signifies high land, was thus called either from its lying higher up the country than Schonen, or from its high mountains. It is ninety-six miles in length, and about twenty-four in breadth. The produce of the arable land is not sufficient for the support of the inhabitants, but they have great plenty of fish, particularly salmon, which is esteemed the best in all Sweden. The inhabitants have also some pearl-fisheries, and an advantageous trade in cattle. The few inhabitants chiefly subsist by grazing and fishing; they also spin, weave, and make a kind of knit garments.

One of the most considerable towns in this province is Helmstadt, which is a pleasant well-built staple town, situated at the mouth of the river Nissa. The fortifications erected here by Christian VI. king of Denmark, have been razed, but the governor of the province resides in the castle. The linen and woollen manufactures established here are in a flourishing condition, and the salmon-fishery near the town is very famous.

The last province which remains to be mentioned in South Gothland is that of Blekingen, which lies to the east of Schonen, and extends about ninety miles in length, and twenty-four in breadth. It is a mountainous country, and exceeds in pleasantness most of the provinces of Sweden; but is computed to contain only about a thousand and eighty-nine families. The inhabitants have a considerable trade in beams, masts, deal-boards, hides, tallow, pot-ash, and tar: the best cheese in Sweden is made here, and grazing turns to a very good account.

The

The principal islands belonging to this province amount to about a hundred and thirty, and it contains twenty-nine parishes. The principal town in the province is,

Carlscron, or Carlscroon, in Latin Caroli Carona, a handsome staple town situated on the Baltic, in the latitude of fifty-six degrees twenty minutes, and longitude fifteen degrees two minutes east from London. It was built by Charles XI. who called it after his own name, and is esteemed next to Stockholm, the best town in the kingdom. A part of it is built on the small island of Biorkholm, where is the marine hospital; part on that of Stubholm, on which the arsenal is erected; and part on the mole, where the fleet is usually laid up. The large and small islands near the town, with the woods of oak, beech, and birch, render its situation extremely pleasant. Here are three churches; these are one Swedish, called the town-church, one which belongs to the Germans, and one belonging to the admiralty. The harbour is so commodious, that the whole royal navy may ride in it in safety, and its mouth is defended by two forts, in which there is a handsome parish church, and a German church. The dock-yard is remarkable for being dug out of a mountain to the depth of eighty feet. Its length is from three hundred to three hundred and fifty feet at the place where the king's fleet lies. This excellent dock, though prosecuted with all possible vigour, employed the engineers from the year 1715 to 1724, before it was completed. Its entrance, which has a sufficient depth of water to set the largest wen of war on float, is closed by two flood-gates, and the basin may be emptied in twenty-four hours; so that the dock becomes quite dry for repairing and careening the ships, after which the water is readmitted by means of two sluices, in order to carry them out of the basin. The inhabitants are supposed to amount to about five thousand.

SECT. VI.

Of SWEDEN PROPER.

Its Situation, Extent, Divisions, Produce, and the principal Places in each; with a more particular Account of Stockholm, the Capital of the whole Kingdom.

SWEDEN properly so called, is bounded on the north by Nordland, on the east by the sea, on the south by Gothland, and on the west by Warmeland and Norway. This country was antiently sometimes a distinct kingdom, and at others united to that of Gothland, as it has been ever since the year 1132. Of all the Swedish dominions this has the greatest number of mines, forges, and hammer-mills. It is divided into the five following provinces: Upland, Sudermanland, Nericia, Westmanland, and Dahl, or the Vale Country. These had all their respective kings, and were governed by their own laws, Nericia only excepted, which had no peculiar laws of its own. This country contains twenty-five cities and towns.

In describing these several provinces, we shall begin with Upland, called in Latin Uplandia. This country received its name from the superiority of the antient kings, who resided at Upsal, to the vassal kings and governors who were their tributaries. This province extends about a hundred and eight miles in length, and ninety in breadth. It is for the most part a level fertile country, that produces wheat, rye, barley, and oats, in such plenty, that the inhabitants sell considerable quantities to their neighbours. But in some parts of Upland there are neither woods nor pastures.

Among the mountains of this province, some are remarkable for having spacious caverns that resemble large regular apartments.

In Swedeland Proper are twelve rivers, and a still greater number of lakes. The principal of the latter is the lake of Maler, which is situated between Upland, Sudermanland, and Westmanland. It is seventy-two miles in length, yields great plenty of fish, and is said to contain twelve hundred and ninety islands. It has a communication with the sea through the mouths of the north and south rivers, which enter it near Stockholm, and its banks are beautifully diversified with towns, castles,

churches, noblemen's seats, and other edifices. In this province are the best iron mines in the kingdom; and there are several wealthy persons who are owners of mines and hammer-mills. The chief employment of the inhabitants is in agriculture, and a number of persons are also maintained by the fisheries.

The most remarkable places in Sweden Proper are the following:

Stockholm, called in Latin Holmia, is a staple city, the capital of the whole kingdom, and the residence of the king, is situated in the fifty-ninth degree twenty minutes of north latitude, and in nineteen degrees thirty minutes east longitude, at the junction of the Baltic and the lake of Maler, and therefore has the convenience both of salt and fresh water. Its circuit, computed from one gate to the other, is twelve miles, and it stands partly on islands and partly on peninsulas. Most of the streets are broad and kept very clean, and the market-places are spacious. In what is properly called the city there are above five thousand houses, most of which stand on piles, though they are entirely built of stone, and are four or five stories high: some of them are covered with copper or iron plates, and others with tiles. Besides these, there are a great number of timber houses in the suburbs, and twenty churches in all.

On the island of Stockholm, which contains what is properly called the city, is the new palace, which is a very magnificent structure, the senate-house, the town-house, St. Nicholas's church, St. Gertrude's or the German church, near which stands a grammar-school, the great market, the bank, the corn quay, and the house of the marine fraternity.

The senate-house just mentioned is a very superb structure, and one of the finest edifices in the kingdom: it is, as it were, one large pavilion, adorned on the outside with columns and marble statues, and within with pictures and sculptures, especially two large halls, where the nobility assemble.

Among the churches that of St. Nicholas is both the largest and most magnificent, it being supported by marble pillars, and covered with copper. It is also adorned with a great number of tombs of different kinds of marble. The statue of St. George on horseback trampling on a dragon is much admired. This is the fabulous history of his delivering Cleodolinda, the daughter of the king of Lydia, and twelve other devoted virgins from the fury of the dragon; and that princess is seen kneeling with her hands lifted up, returning thanks to their preserver. Over the altar is a cabinet finely gilt, on which is a table of a pyramidal form, with shelves of massy silver, on which are the following histories in basso relievo: on the first is the nativity of Christ; on the second his last supper; on the third his crucifixion; on the fourth his burial; and on the fifth his resurrection. These are all of silver, and on the top is a statue of the same metal about two feet high, representing the Ascension. There are other silver statues about the altar of the same height; as that of Moses, with the two tables of the law; John the Baptist, with a cross and lamb; and the evangelists, with the animals usually assigned them by painters and statuaries; all of them of silver, weighing together about thirty thousand ounces. This is the account given by several authors; but it is probable that the necessities of the state have caused this silver to be applied to a very different purpose. On the right side of the altar is a large picture of heaven and hell, which reaches from the roof to the pavement, and on the left side of the altar is painted the crucifixion. This church is very rich in plate, and, according to Mr. Mottraye, is worth no less than forty thousand crowns. The other churches are little remarkable, only they are generally covered with copper, have very lofty spires, and instead of bells have very musical chimes in their steeples, which play upon festivals and other solemn occasions.

The other islands on which the city stands are, the Ritterholm, which lies on the west side of the city, with which it has a communication by means of a bridge. On this island stood the old royal palace, which was burnt in 1697, and St. Francis's church, in which are interred many of their kings and queens.

Helgandsholm,

Helgandsholm, or the island of the Holy Ghost, which lies in the north channel between the city and the north suburb, and contains, among other buildings, the king's stables.

Schiffsholm, which lies to the east of the city, and contains the dock-yard and the admiralty.

Konigholm, on which stands the Ulrica Eleanora church.

Ladugardsland, which is considered as a suburb, and contains Hedwick's church, a market-place, an orchard belonging to the king, an orphan-house founded by the free masons in the year 1750, also two large suburbs. On the east side of this island is a royal palace named Frederichshof, built in 1732 by Frederic I. and near it is a park and an orangery, which is much admired.

The north suburb is separated from the city by what is called the north stream or channel, and lies in Upland, containing four churches, another orphan-house, the arsenal, and three market-places.

The south suburb is separated from the city by a canal dug in the year 1008, and lies in Suderland. In this suburb are three churches, one of which belongs to the Dutch Calvinists, and also a Russian chapel, with the Sudermaler market, in which is the town-house, the new market, a large hospital, and a fine iron weigh-house.

All these parts of Stockholm are joined together by bridges. The city on one side affords a prospect over the lake, and on the other over the harbour, which, being almost enclosed by rocks, resembles another lake; its water is so little brackish that it may be drunk, which is owing to the great quantity of fresh water that runs into it from the lake.

We have observed that the houses in these suburbs are chiefly built with wood, and it is said the inhabitants sometimes send the dimensions of the house they intend to build to Finland, where the walls and several separations are formed of pieces of timber laid one upon the other, and joined at the corners, and afterwards marked, taken down, and sent by water to Stockholm, there to be set up and finished.

The number of inhabitants who pay taxes in this metropolis is computed at sixty thousand.

The government of the city is lodged jointly in the magistracy and the governor, who presides in the royal chancery, and the city council-chamber. There are besides four burgomasters. The magistracy is divided into four particular offices: those of justice, the police, trade, and manufactures; and likewise into three courts of judicature. Here is also held the royal high court of Sweden established in 1614, for Sweden properly so called. In this city are likewise a college of physicians, a royal academy of sciences instituted in 1739, a royal academy for military architecture, and another for land-surveying, a chemical and mechanical laboratory, an academy of painting and sculpture, and a royal library.

There are besides in this capital a board of admiralty, a navy-office, a custom-house, an office of the revenues, a national bank, an insurance-office, an edifice where goods manufactured in the kingdom are examined, and disputes between manufacturers decided, a large iron weigh-house, commodious docks, in which many ships are built for foreigners, with manufactories of porcelain, glass, silk, woollen cloth, canvas, cotton, and parchment.

The foreign and domestic trade of Stockholm may be supposed to be very considerable, as it has an excellent harbour; but the many rocks at its mouth render its entrance somewhat difficult.

About a mile to the west of Stockholm is Carlberg, a fine royal pleasure-house, with a garden laid out in a most elegant taste, and adorned with some beautiful statues.

Three miles to the north of Stockholm is Ulricsholm, another royal seat, which has a fine park and garden, remarkable for the elegance of its curious grotto.

On the island of Lofon, which lies about a Swedish mile to the west of Stockholm, is Drotningholm, the finest of all the king of Sweden's palaces: it was founded by Hedwig Eleanora, consort of prince Charles Gustavus, the former palace being consumed by fire. Facing

the south front of this noble structure is a pleasant garden adorned with a variety of fountains, and the east and north sides exhibit a view of the ships at sea.

At the distance of about twelve miles from Stockholm, just at the entrance of the channel into the lake, is Waxholm, a strong citadel, built on a small island, in the year 1649. It has been since greatly improved and enlarged, so that it resembles a little town. On this island, which is called Waxon, are also a church, a school, and a custom-house, and here all homeward-bound ships are searched. The chief employment of the inhabitants is fishing.

The next place we shall mention is Upsal, in Latin Upsalia, a very antient and pretty large city, seated on the river Fyris, which divides it into two parts, that on the east side of the river being properly the city, and that on the west called Fierding. Upsal was antiently the chief seat of the sovereigns of Sweden, where they held their supreme tribunal. During the times of Paganism the greatest sacrifices offered by all the northern provinces were brought hither, and the most eminent heathen priests resided in the city. It is situated in latitude sixty degrees ten minutes, and in the seventeenth degree fifty-six minutes east longitude from London.

All the buildings of Upsal are of wood, except the cathedral and a few stone houses, and the roofs are frequently composed only of the bark of birch trees covered with turf. Here are three churches, the principal of which is the cathedral, which was built in the thirteenth century, but was not consecrated till the year 1435. The architect, being a native of Paris, took the church of Notre Dame in that city for his model. This cathedral has been five times destroyed by fire, the last time was in 1702; however, it has been since rebuilt in an elegant manner. The royal palace was consumed in 1702. Here the kings of Sweden are generally crowned.

Here is an university, called Academia Gustaviana, which is three stories high, and was built by Gustavus Adolphus in 1622. It has a round dome at the top, in which is a curious anatomical theatre; it has also a very valuable library, which contains near a thousand manuscripts. The museum, or cabinet of curiosities, is said to be worth a thousand Swedish dollars, at one shilling and nine-pence each: it has an astronomical observatory planned by the celebrated Celsius, and a physic-garden chiefly laid out by the famous Linnæus. A royal academy of sciences was instituted here in the year 1728. The archbishop of Upsal, who is the only one in the kingdom, is vice-chancellor of the university. The Swedish geographers place their first meridian, from which they compute the longitude, at Upsal.

Sudermanland, the second division of Sweden Proper, is a hundred and fifty miles in length, and seventy-two in breadth, and appears to have been one of the first that was inhabited and cultivated in this kingdom. The soil is fertile, and no labour is spared for its improvement; it abounds in fine arable land, pastures, woods, iron mines, and forges. Its lakes are well stocked with fish, and its advantageous situation, between the sea and the lake of Maler, is the cause of its carrying on a considerable trade. This country has several other lakes besides that just mentioned, particularly the Kielmar, which is forty-two miles long, and has a communication with the lake of Maler by means of a canal and the river Arboya. Among the principal lakes is also that of Bawen, in which are a hundred islands.

The inhabitants chiefly subsist by agriculture, fishing, hunting, and working in the mines; and carry on a considerable trade in corn, iron, and wooden-ware. From the pleasantness and fertility of this country the queen-dowager used to have her dowry, and the dukes their dutchies in this province.

The principal city in Sudermanland is Nikioping, which signifies a new mart, and is called in Latin Nicopia. It is a well-built staple town, and the capital of the province. It is one of the most antient cities of Sweden, and was formerly the residence of the kings and princes of Sudermanland. The air is so temperate and salubrious, that when a contagious disease prevails in Sweden, the royal family and the public offices have frequently removed from Stockholm to this place. The city

city is divided into nearly two equal parts by a large river, over which a stone bridge was built in the year 1728, that is scarcely to be equalled in the whole kingdom. Here was formerly a very antient castle famous in history; but it was demolished in 1665: in this structure the kings of Sudermanland resided, and it was so strongly fortified, that it was thought to be little inferior to those of Stockholm and Calmar. The streets of the city are all well laid out, and the High Street planted with Dutch limes. It has two handsome churches, with the palace of the governor of the province, who resides there; and without the town is a royal inclosure. It has a commodious harbour, and the inhabitants, who amount to about twelve hundred, have several manufactures of cloth, and what is called Morocco leather: they speak the Swedish language in the greatest purity, and carry on a considerable trade by sea. Its chief magistrates are two burgomasters. Nikioping was almost consumed by fire in 1661, and suffered extremely by the ravages of the Russians in 1719.

The province of Nericia, called by the Swedes Nerike, is sixty miles in length, and forty-six in breadth. The soil is in most parts fertile, and produces corn and pasturage. The country has also quarries of loadstone, limestone, and allum; with mines of iron and sulphur. Here are large woods, several high mountains, seven considerable rivers, and twenty-three lakes, which abound with fish.

Nericia is famous for its flourishing manufactures of all kinds of hard-ware, and in particular has always been remarkable for forging arms, &c. The chief employments of the inhabitants are agriculture, working in the mines and forges, hunting, and fishing; and they trade in grain and all kinds of iron-wares.

The principal place in this province is Orebro, an antient town situated at the junction of the river Schwartz with the lake of Hielmar, in fifty-nine degrees twenty-five minutes north latitude. It is a long narrow town, with a castle encompassed by water; and, as it has been frequently besieged, king Gustavus I. caused it to be well fortified, and the fortifications have been since improved. It has at present two churches, a grammar-school, and a manufacture of fire-arms. Its harbour on the lake of Hielmar has a communication with the Maler, by means of the river and canal of Arboga, and consequently there is a passage by water from hence to Stockholm. The inhabitants carry on a considerable trade, and have the reputation of using great exactness in their weights and measures.

The sulphur work of Axberg lies about seven miles from Orebro. Of the ore dug up here, our author says, is first made sulphur, afterwards vitriol, and lastly a red colour for painting.

We now come to the province of Westmanland, in Latin Vestmania, which is a hundred and two miles in length, and sixty-four miles in breadth. The soil is fertile, and principally consists of arable land, with meadows, pastures, and some fine woods. It also contains silver, copper, and iron mines: it has many curious copper, steel, and brass hammer-mills; and, indeed, is the most famous province in the kingdom for mines, the quantity of iron annually exported from hence amounting to a hundred and twenty thousand pounds. The south part of the province supplies the inhabitants of the mine districts in the north with corn.

This province is well watered both by rivers and lakes, which yield vast plenty of fish; and the lake of Maler is of very great advantage to its commerce, as it affords a communication between this district and Stockholm.

The following are the most remarkable towns in this province:

Westerahs, in Latin Arosia, an antient inland town situated on the banks of the river Schwartz, which, after running through it, discharges itself into the Maler. It is an episcopal see, and has a castle, part of which is made use of as a granary, a seminary, a weigh-house for metals, from whence a vast quantity of copper, brass, and iron is annually exported to Stockholm, and is the residence of the governor of the province. The cathedral, which is a spacious and magnificent structure, is particu-

larly remarkable for the architecture of its tower, and for being the burial-place of king Eric XIV.

Sala, or Salberg, a handsome large mine town situated on the river Sag, in the sixtieth degree ten minutes north latitude, and in the seventeenth degree five minutes west longitude. It was built by king Gustavus Adolphus in 1624, who endowed it with several privileges. The streets are straight and well paved, and the market-place regular and spacious. Here is held a mine court, a court of works, and town council, and an inferior court of judicature. To this town belong several considerable estates, and the neighbouring villages supply the inhabitants with all kinds of commodities at a very cheap rate; no custom or duty being paid here.

Near the town is a very large antient silver mine, which used annually to produce twenty-four thousand Lothige marks of silver, each of these marks equal to nine ounces twelve pennyweights troy, but it is now greatly declined. In 1710 the royal family chose this town for the place of their retreat during a raging pestilence, and in 1736 it was destroyed by fire.

We now come to Dalecarlia, also called Swedish Thalland, from its many valleys. This province is two hundred and forty miles in length, and a hundred and fifty-six in breadth: it is very mountainous, and has little arable land; but where the soil between the mountains allows of tillage, it yields plenty of oats and pease, of which the inhabitants make bread. It is indeed every where diversified with mountains, valleys, woods, heaths, lakes, and rivers; and abounds in mines of silver, copper, and iron; with quarries of slate and mill-stones, and the pastures are proper for grazing, which turns to good account.

The inhabitants, who are called Dalecarlians, are celebrated for their integrity and firm attachment to their king and country, and particularly for their bravery. They are proof against toil, hardships, and want; and have thoroughly learned the advantage of industry and œconomy, by being able to subsist by their labour in such a barren mountainous country. In many parishes there is scarce a man who is not skilled in all necessary handicraft trades; and when they are in other parts of the kingdom, they hire themselves as labourers, masons, carpenters, and the like. They trade in the bark of birch trees, hops, slate, lime, wooden-ware, scythes, hatchets, and other iron utensils. In the north part of this province they speak a particular language that has a great affinity with the Gothic dialect; and they still retain the manner of living, dress, and customs of the antient Swedes. The Runic calendar is still in use among them, which they carry about them as a perpetual almanac.

The principal towns in this province are,

Hedemora, a very ancient city, which has been handsomely rebuilt: it stands on the lake of Hafran, carries on a good trade, and has an annual fair on the festival of St. Peter and St. Paul. It is indeed one of the principal cities in the whole kingdom, and is famous for the gunpowder made there. A mint was formerly set up in this town by Gustavus Vasa; and some of the pieces coined in this place are still to be seen in the cabinets of the curious. The gardens around the town, in which fruit trees are cultivated, are the most pleasant in all Dalecarlia.

Falun, in Latin Faluna, is a mine town, situated between two lakes and two mountains: it is large and very populous, but though its streets are regular, the houses are ill built with timber. One of its two market places is very spacious and handsome. On the north side of it stands a large stone edifice, in which is held a court of justice; and in the same market place are erected a granary and dispensary. On the east side of it, is a handsome church built with stone, and the roof covered with copper, the doors are of brass, and the tower is remarkably high. Without the town, towards the east, stands another church built with stone, and covered with copper. Falun has a good school, a fine copper weigh-house, a mine court, and other inferior courts. At a small distance to the west of Falun, is the famous copper mine that used every year to produce ten thousand

sand tons of copper, and in some years even more, but of late its produce is greatly decreased. The depth of this mine is 350 Swedish ells, and a great variety of curious engines belong to this work.

S E C T. VII.

Of Nordland, its Situation and Produce. Its Provinces described, with the Peculiarities and principal Places in each.

NORDLAND, in Latin Nordlandia, doubtless received its name from its being situated to the north of Sweden Proper. It is bounded on the east by the gulph of Bothnia; on the south by Upland and Dalecarlia; on the west it joins to Dalecarlia, Norway, and Lapland; and to the north it borders on Lapland only. This country, in the times of paganism, was a distinct monarchy, to which several vassal kings were tributary. It has more timber and venison than any of the other parts of the kingdom, but its rocks and mountains leave only a small extent of land fit for tillage. It has however some fertile spots and verdant pastures, that are agreeably interspersed with lakes, rivers, and woods, which abound with fish; and a great number of cattle are bred in the country. Here are greater flights of wild geese than in any other part of the kingdom; but oak and birch trees do not grow wild beyond Upland, so that those trees are very scarce. This province has several rich mines.

It is divided into seven provinces, and yet has no more than nine towns.

The province of Gastrickland, in Latin Gastricia, derives its name from the word Gastrick, which signifies hospitable, and contains little arable land, it mostly consisting of mines, woods, rivers, and lakes, from which the inhabitants procure a tolerable subsistence.

The only remarkable town in this province is Gesele, in Latin Gevalia, which is the largest in all Nordland, and is well situated on a creek of the gulf of Bothnia. The river Gesele, which runs through the town, supplies it with plenty of salmon, and afterwards dividing into three branches, forms the two pleasant islands of Alderholm and Islandsholm; and about the distance of three miles from the town discharges itself into the main sea. This is a staple town of such antiquity, that it boasts of being founded three hundred years before Stockholm. Some of the buildings are of stone, and others of wood, others have a mixture of both. The streets are very irregular, and the market place so badly laid out, that a stranger would never be able to find it without a guide. The town is populous, and has a fine town-house built with stone, a very ancient hospital, that was rebuilt with stone in the year 1731; and it carries on an advantageous trade. The company of fishermen constitute two thirds of the burghers. The castle was entirely destroyed by fire in 1727, but it has been since rebuilt, and the governor resides in it. On the neighbouring island of Alderholm just mentioned, are a handsome iron weigh-house, a dock, a landing-place for deals, &c. a large custom-house, an arsenal, a magazine, and two warehouses; and several magazines and warehouses are also erected on Islandsholm.

The province of Halsingland, called in Latin Helsingia, is one hundred and twenty miles in length, and ninety-six in breadth: its pastures feed a great number of fine cattle, and the little arable land it contains yields good crops. Linseed is cultivated here with great industry. Here are also large forests and good iron works.

The inhabitants trade in iron, linen, tallow, butter, tar, deal boards, timber, and wild fowl, as partridges, woodcocks, and moorhens, some thousands of which are every winter carried in sledges to Stockholm. The Helsingians are celebrated for their bravery, and have made themselves masters of several countries where they have settled, and to which they have given their own name. Besides the Gothic or Runic calendar, which is here every where known, they have the Halsingland Runic, as it is called, which differs from the former.

There are no considerable cities in this province, those most noted being only small sea-port towns that contain nothing worthy of observation.

The province of Medelpad, in Latin Medelpadia, is eighty-four miles in length and forty-two in breadth. Though it is very mountainous and woody, it has several valleys of arable and meadow land. The seed is not sown here till about Whitsuntide, but the corn ripens in ten weeks. Among the forests of this province there are some of prodigious extent that abound in game of all sorts, as elks, rein-deer, beavers, martens, lynxes, foxes, weasels, and wild-fowl.

The country is agreeably interspersed with lakes and rivers, which supply it with plenty of fish; and the grain produced in the province is sufficient for the support of its inhabitants. They have also plenty of cattle; and deal in timber, hoops, flax, hemp, butter, fowls and dried fish; salmon and seals are also caught here.

The principal place in this province is Sundswall, a well-built small town, and the only sea-port in the country. It was built in the reign of Gustavus Adolphus, on the spot now called the Old Town, but formerly the Trading-Place; but in 1647 was rebuilt by Queen Christina in its present situation, which is a barren sandy plain between high mountains. In the middle of the town is a pond well stocked with a kind of small carp. A woollen manufacture has been lately set up in this town; and here is a dock where several large vessels have been built. The harbour, which is above a league in breadth, is very commodious, and the inhabitants have a good trade in linen, flesh, cheese, butter, wooden chairs, deals, tar, and the bark of birch trees.

The next province we shall describe is that of Jamtland, called in Latin Jemtia, which borders on the kingdom of Norway, and is nearly of a circular form. It is an hundred and thirty-six miles in length, and an hundred and twenty in breadth, and was annexed to the crown of Sweden in 1658 by the treaty of Roschild. It is in general a mountainous country; the western part, on the frontiers of Norway, is over-run with vast craggy rocks and high mountains, and between these are deep vallies and rapid torrents; but there are some verdant spots among the mountains, that afford good pasture: in these parts the inhabitants house their cattle even in summer-time, and by this means breed fine cows, whose milk yields excellent butter.

The eastern part consists of a champaign country, watered by several lakes and rivers that abound with fish. Barley is the grain mostly sown here; they also sow a considerable quantity of rye, and some wheat, with oats of an extraordinary goodness. The country abounds with excellent turneps. The severity of the frost sometimes, indeed, causes a scarcity of corn, which obliges the Jamtlanders to make bread of the pounded bark of trees, the rye bread being reserved for festivals. Here are great numbers of elks, which the Jamtlanders castrate, in order to make them grow large and fat: and many hands are employed in extracting iron from a kind of iron ore, that resembles small stones, and are collected in fenny places. Here are also allum quarries, sand-stone, slate, the lapis ollarius, fine rock-crystals, lead-ore, a place where salt-petre is refined, and two new built copper-works.

This country is so thinly inhabited, that there are only six places where divine service is performed every Sunday; in some churches it is celebrated every other Sunday, in others only every third Sunday, and in all the rest the congregations assemble but three or four times a year. There is not so much as one town in the whole country, and only eleven parishes, in which are erected forty-six churches: in all these parishes there are but seven hundred and seventeen chimnies, though they form an area of two thousand four hundred square miles.

The inhabitants chiefly subsist by agriculture, grazing, hunting and fishing. They likewise carry on a considerable trade with the Norwegians, whom they supply with salt-pans, steel, iron-ware, and a kind of leather, dressed in such a manner as entirely to keep out the water; with this leather they make shoes, boots, and even jackets, that are proof against wet. In this solitary and

desart country, hypocondriac disorders and self-murders are very frequent.

The next province we shall describe is that of Harjedalen, in Latin Hardalia, which was added to the Swedish dominions by the treaty of Bremsebro, concluded in 1645, and is ninety miles in length, and from forty-two to forty-eight miles in breadth. It abounds in woods and mines; but little of the ground is tilled: it has however pastures that enable the inhabitants to carry on an advantageous trade in horned cattle; they subsist by grazing, hunting, and fishing, and sell a great quantity of cheese, which is much esteemed.

The province of Angermanland, in Latin Angermania, lies to the north of Harjedalen, and is an hundred forty-four miles in length, and thirty-six in breadth. It is extremely mountainous and woody; but some parts produce barley, rye, pease, linseed, and good flax; the meadow lands afford pasture for the cattle, and the lakes and rivers yield plenty of fish. Here are several fine iron works; and in the bottom of some of the stagnant lakes is found a fine red colour fit for painting.

The only town in this country is Hernosand, in Latin Hernesandja, a sea-port on the island of Hernon, near the mouth of the river Angerman, where it discharges itself into the gulf of Bothnia. It was built in 1584, and has a communication with the continent by a bridge about a hundred Swedish ells in length. The houses, which are of timber, have very thick walls, and stand on the declivity of a hill towards the sea. On the north side of the harbour the water is of a sufficient depth for the largest ships to come up and unload at the warehouses; but on the south side this can only be done by flat-bottomed vessels and lighters. This was formerly a staple town, and it still carries on a considerable trade, particularly in linen, and the annual fair held at this town on the fourteenth of September, is the most frequented of any in Nordland. The town has a seminary and a school. In 1710, 1714, and 1721, it was burnt by the Russians, but it has since recovered from these dreadful desolations.

The last province in Nordland is that of West Bothnia, which lies on the west side of the upper part of the gulf of Bothnia, while the opposite side is termed East Bothnia, of which we have given an account in our description of Finland.

The inhabited part of West Bothnia, from the frontiers of Angermanland to the church of Upper Tornea, is computed to be about three hundred forty-eight miles in length, and its breadth from ninety-six to a hundred and eight miles. Many pleasant islands lie off the coast of this province; it has also several forests, with many lakes and rivers. West Bothnia has some excellent pastures, though the summits of the high mountains are mostly covered with moss, on which the rein-deer generally feed. The land is for the most part level, and the soil tolerably fertile; for though they sow the corn very late, it ripens in six, seven, or eight weeks, according as the place lies more or less exposed to the north winds: sudden frosts, however, often prove extremely detrimental to the corn, particularly the frosty nights that frequently happen in the month of July. There are also several good copper and iron mines in this province.

The inhabitants, who are famed for their courage and bravery, subsist by agriculture, grazing, hunting, and fishing; they endure hunger and want better than most other people, they being inured to it from their youth, and even in fruitful years they mix their corn with chaff and pulverized pine-bark, to make what they term pounded bread. They trade in fables, and the skins of blue and white foxes, hyenas, bears, wolves, ermines, martens, beavers, and rein-deer; and also in beams, deal boards, timber, and shingles; tar, salted and smoke-dried salmon, and other fish; train oil, venison, tallow, butter, cheese, castor, and linen. These commodities are not only carried to other parts of Sweden, but over the mountains to Norway, or through vast deserts to Russia.

West Bothnia is divided into four inferior governments, the principal places in which are,

Umea, in Latin Uma, a considerable sea-port town, built by Gustavus Adolphus, at the mouth of the river

Umea. It has four streets, which extend in a straight line from east to west, with several others intersecting them at right angles from north to south. At the east angle is a large area, on which the church stands; the harbour is commodious, and the inhabitants carry on a considerable trade.

Pitea, in Latin Pitovia, is a sea-port situated in a small island at the mouth of a river of the same name. It is joined to the continent by a wooden bridge, at the end of which a gate is erected. The streets run in parallel lines; but the church stands a good way without the town; so that the bridge must be crossed to go to it. Pitea was first built in 1621, by Gustavus Adolphus, about three miles higher up in the country; but the town being entirely destroyed by fire in 1666, it was rebuilt on its present situation, where it has a commodious harbour and a good school. Old Pitea is now a large village, consisting of many houses irregularly scattered on a fine common.

The last town we shall mention in this province is Tornea, in Latin Torna, a small sea-port situated on a peninsula formed by the river Tornea, where it falls into the gulph of Bothnia, in the sixty-fifth degree fifty minutes fifty seconds north latitude, and is said to be the farthest towards the north of any town in Europe. It has three streets, which run in parallel lines from north to south, and are intersected at right angles by fourteen cross streets or lanes. The church, which is built with timber, stands at a small distance from the other buildings; but within the pallisades that inclose the town, and also a pretty large piece of arable land. Divine service is here performed in the Swedish language, which is used by the burghers. There is another church built with stone on an island called Bjorkhon, which lies near the town, and here the service is performed in the Finnean language for the benefit of the servants of the burghers, and the inhabitants of the adjacent country. All the dwellings in Tornea, like those in the neighbouring country, have a large court, of which two sides at least are taken up with apartments; and in the other two are the stables, barns, and other out-houses. These courts, in the country habitations, are exactly square; but in Tornea are of an oblong form. A very considerable trade is carried on here, not only by the Swedes and Laplanders, but by the Norwegians and Russians; who also resort to the trading places of Tornea, in order to traffic.

Mr. Busching observes, that in 1694 this town was honoured with the presence of king Charles XI. who, being accompanied by several persons of distinction and learning, took a view of the sun at midnight from the tower of the church at Tornea; for in the midst of summer the sun may be seen above the horizon when in the opposite part of the meridian of Tornea, by a spectator placed at a certain height above the surface of the earth.

S E C T. VIII.

Of SWEDISH LAPLAND.

Its Situation and Extent; with a very particular Account of the Climate, and Face of the Country; the Beauty of the Northern Lights in a Lapland Winter; the Beasts, Birds, and Fishes.

SWEDISH Lapland, which is called by its inhabitants Sameland, or Samenolmoi, is bounded on the east by East Bothnia and Russian Lapland, on the south by Jamtland, and on the west and north by Norwegian Lapland. According to some computations this country is four hundred and twenty miles in length, and three hundred and sixty in breadth; but others represent it as every way much more extensive.

It must, however, be acknowledged, that this country seems at first sight, especially in winter, scarce fit to be the habitation of man. In most places it abounds with rocks and mountains, whose summits seem to pierce the clouds, and are covered with everlasting snow. Other parts of Lapland consist of barren heaths and sandy deserts, over-run with moss, fern, and to appearance unprofitable weeds; while one barren wild stretches beyond another,

another with little or no pasture growing on the intermediate spots.

Besides these inconveniencies, the long and severe winters, the cold, dark, and tedious winter nights, with the vast depth of snow that covers this desolate region, might seem sufficient to deter every living creature from fixing his abode in this inhospitable country. The description given by M. Maupertuis of the severity of this climate, when he, with other astronomers, went by order of the French king to determine the figure of the earth at the polar circle, is enough to make one shudder, though he made his observations on the southern borders of this country. "In December, says he, the snow continually falling, or ready to fall, for the most part hid the sun the few moments he might have appeared at mid-day. In the month of January the cold was increased to that extremity, that Mr. Reaumur's mercurial thermometer, which at Paris, in the great frost of 1709, it was thought strange to see fall to fourteen degrees below the freezing point, were now got down to thirty-seven. The spirit of wine in the others was frozen. If we opened the door of a warm room, the external air instantly converted all the vapour in it into snow; whirling it round in white vortexes. If we went abroad, we felt as if the air was tearing our breasts in pieces; and the cracking of the wood of which the houses are built, as if split by the violence of the frost, continually alarmed us with an increase of cold; and in this country you may often see people who have lost an arm or leg by the frost. The cold, which is always very great, sometimes increases by such violent and sudden fits, as are almost infallibly fatal to those who are so unhappy as to be exposed to it; and sometimes there rise sudden tempests of snow that are still more dangerous. The winds seem to blow from all quarters at once, and drive about the snow with such fury, that all the roads are in a moment rendered invisible. Dreadful is the situation of a person surprized in the fields by such a storm: his knowledge of the country, and even the mark he may have taken by the trees, cannot avail him: he is blinded by the snow, and if he attempts to find his way home is generally lost. In short, during the whole winter the cold was so excessive, that on the seventh of April, at five in the morning, the thermometer was fallen to twenty divisions below the point of freezing, though every afternoon it rose two or three divisions above it: a difference in the height not much less than that which the greatest heat and cold felt at Paris usually produce in that instrument. Thus in twenty-four hours we had all the variety felt in the temperate zones in the compass of a whole year."

When at last, in summer, the sun warms the air, Lapland is infested with such swarms of gnats and flies of various species, that, like clouds, they darken the sky, and obscure the light of the sun. These fix on every naked part of the body, bite with unremitting fury, and some draw blood wherever they fix.

After this description it must appear much less surprising that Lapland should be thinly peopled, than that it should be peopled at all: but notwithstanding these disadvantages, Nature has bestowed on these dreary regions several conveniencies; and it is certain, however improbable it may appear, that content and happiness are to be found there.

The mountains, which are of a prodigious height and extent, are perhaps intended to shelter the plains from violent winds; and even their wildness and irregularity has something very entertaining to the eye, especially in summer: the alternate succession of hills and valleys exhibit a delightful variety of prospects; and there are some places in this country, which in summer may be reckoned amongst the most delightful spots in the world. The fine lakes, says the last mentioned author, that surround the mountain of Niemi, give it the air of an enchanted island in romance. On one hand you see a grove of trees rise from a plain smooth and level as the walks of a garden, and at such easy distances as neither to embarrass the walks, nor the prospect of the lakes that wash the foot of the mountain. On the other hand are apartments of different sizes that seem cut by art in the rocks,

and to want only a regular roof to render them complete. The rocks themselves are so perpendicular, so high, and so smooth, that they might be taken for the walls of an unfinished palace, rather than for the work of nature. "From this height, he adds, we saw those vapours rise from the lake which the people of the country call haltios, and deem the guardian spirits of the mountains. We had been frightened with stories of bears haunting this place, but saw none. It seemed rather, indeed, a place of resort for fairies and genii, than for those of savage animals."

It also appears, from the trials that have been made, that these mountains are inferior to none in the richness of ores and fossils: at least the largest and clearest rock-crystals, purple amethysts, topazes, loadstones, native cinnabar, quicksilver, and other fossils and minerals, have been found in their bowels.

If at a certain season of the year the days are very short, and the nights long, tedious, and irksome; this is in some measure compensated by the pleasant luminous summers, when, in most parts of this country, the sun is visible for several weeks above the horizon; a phenomenon to which the inhabitants of the temperate climates are entirely strangers. Even in winter, the radiancy of the sun, the brightness of the moon-light, the twinkling of the stars, and the effulgent corruscations of the aurora borealis, afford a light sufficient for most occasions of life. "The short days are no sooner closed, says Maupertuis, than fires of a thousand figures and colours light up the sky, as if designed to compensate for the absence of the sun. These fires have not here, as in more southern climates, any constant situation. Though a luminous arch is often seen fixed towards the north, they seem more frequently to possess the whole extent of the hemisphere. Sometimes they begin in the form of a great scarf of bright light, with its extremities upon the horizon, which, with a motion resembling that of a fishing-net, glides softly up the sky, preserving in this motion a direction nearly perpendicular to the meridian; and most commonly after these preludes, all the lights unite at the zenith, and form the top of a crown. Arcs like those seen in France towards the north, are here frequently situated towards the south; and often towards both the north and south at once. Their summits approach each other; the distance of their extremities widens towards the horizon. I have seen some of the opposite arcs whose summits almost joined at the zenith; and both the one and the other have frequently several concentric arcs beyond it. Their tops are all placed in the direction of the meridian, though with a little declination to the west; which I did not find to be constant, and which is sometimes insensible. It would be endless to mention all the different figures these meteors assume, and the various motions with which they are agitated. Their motion is most commonly like that of a pair of colours waved in the air, and the different tints of their light gives them the appearance of so many vast streamers of changeable taffety. Sometimes they line a part of the sky with scarlet. On the eighteenth of December I saw a phenomenon of this kind, that in the midst of all the wonders to which I was now every day accustomed, raised my admiration. To the south a great space of the sky appeared tinged with so lively a red, that the whole constellation of Orion looked as if it had been dipped in blood. This light, which was at first fixed, soon moved, and changing into other colours, violet and blue, settled into a dome, whose top stood a little to the south-west of the zenith. The moon shone bright, but did not in the least efface it. In this country, where there are lights of so many different colours, I never saw but two that were red; and such are taken for prefaces of some great misfortune. After all, when people gaze at these phenomena with an unphilosophic eye, it is not surprizing if they discover in them armies engaged, fiery chariots, and a thousand other prodigies."

Another advantage is the twilight, which begins four or five hours before sun-rise, and lasts as long after that luminary is set. Indeed many of the inhabitants sleep away most of the dark season, and employ the luminous

part of the year in their respective occupations ; and, in general, suffer little in their health from this apparent inconvenience.

In the woods upon the mountains are almost as many trees fallen as standing ; for the soil, after having raised them to a certain height, can generally no longer furnish proper nourishment ; nor is it deep enough to allow them to take firm root ; whence they are overfet by the least blast of wind, and in all these woods a multitude of firs and birches are blown down. Time reduces the wood of the latter to dust, without affecting the bark ; and one would be surprized to find pretty large trees that crumble upon the slightest touch. This probably gave the Swedes the hint of covering their houses with this bark ; and indeed nothing can be imagined fitter for the purpose.

In the valleys, and along the banks of the lakes and rivers, where the trees find a deeper soil, pine, fir, birch, juniper, aspen, alder, willow, and other trees, are observed to thrive ; and some wholesome vegetables, berries, and flowers, are produced. The pine-trees are more serviceable than orchards would be there ; that beneficial tree, besides several other uses to which it is applied, being an essential part of the food of the inhabitants ; for a labouring man who feeds on bread made of the pounded bark of the pine-tree, preserves his health and vigour to a great age.

Lapland abounds in many kinds of beasts, birds, and fishes. The furs and skins of bears, wolves, beavers, martens, otters, wild and tame rein-deer, hyenas, ermines, hares, squirrels, black, red, and white foxes, &c. bring a great deal of money into the country. Here are also a species of partridges, moor-hens, woodcocks, falcons, snow-birds, as they are called, and other large and small birds.

The fisheries not only afford a plentiful subsistence to many of the inhabitants, but enable them to sell a considerable quantity of fish to their neighbours. The pearls found in the rivers of Lapland are remarkably valuable ; and swans, geese, all kinds of wild ducks, and several sorts of sea-fowl unknown in other countries, abound here, especially in the southern parts of Lapland.

SECT. IX.

Of the Persons, Dress, and Manner of Life of the Laplanders, whose principal Wealth and Subsistence consists in their Rein-deer, which are therefore particularly described. Their Arts ; the Riches of those who engage in Trade ; their Tents and Furniture ; and their Skill in the Management of their Boats. The Food of the different Tribes.

THE Laplanders are of a brown and swarthy complexion, which is the case with the inhabitants both of very cold and very hot countries ; their hair is black, and their faces broad, with peaked chins, and hollow cheeks. They are generally of a middling stature. The all-wise Creator has made a provision for them against the severity of winter, by placing there a multitude of animals, whose soft and warm furs and skins defend them from the most piercing cold.

The upper garment both of the men and women is made of skins with the hair on, formed like the ploughman's frock, girt about them with a broad belt ; they wear breeches which reach down to their ancles, and their cap, which is made of the skin of a young rein-deer, fits as close to their heads as a scull-cap, covering all the neck and shoulders. Their shoes are peaked, and turned up at the toes. The finery of the women consists in a kind of pewter wire, with which they work the bosoms of their coats, their girdles, and the edges of their caps. Neither sex know what it is to wear linen ; but in the cold season wear next the body a fawn's skin waistcoat. Almost the only difference between the dress of the men and that of the women is, that the latter is somewhat longer. A purse hangs at their girdles, with their money, rings, and toys ; a knife, and a leathern bag.

These people afford an instance of a whole European nation subsisting contentedly without ploughing, sowing, or planting ; without spinning or weaving, brewing or

baking. They employ themselves in feeding of herds ; and as their lot is cast in a country where winter takes up the greatest part of the year, and consequently renders it impossible for them to provide a sufficient quantity of hay and fodder for great herds of cattle, the bountiful Creator has therefore bestowed on them a species of animals that are provided for with little trouble : this is the rein-deer, which of all tame animals requires the least attendance and support, while it procures the greatest advantage to its owners. These creatures provide for themselves, feeding in summer on leaves, moss, and grass, of which they find as much as is sufficient for them, even among the mountains ; and in winter live only on a kind of moss that grows in almost every part of Lapland. They come at this moss by scraping away the snow with their feet, and are taught by instinct to find the spots where it grows. During a journey of several days with these animals, the only trouble a traveller is at is, either to turn them loose, or tie them to a tree, where the quantity of food they eat at a time does not exceed a handful. The Laplanders are only solicitous to keep their herds of rein-deer from going astray, and to protect them from wild beasts ; and this, particularly in summer, they think no inconsiderable task. They have no occasion to house these animals, for they always lie out in the open air, without any inconvenience ; and when after a strict search there is no danger from beasts of prey, they turn them loose into the woods ; but when they are under any apprehension of danger from that quarter, they are watched by the Lapland herdsmen.

The rein-deer nearly resembles a stag, except its hanging the head down a little, and the horns projecting directly forward : besides, on the fore part of the head, near the root of the large horns, are two smaller branches ; so that they seem to have four horns. There are two different species of these animals, namely, the wild and the tame. The latter is well made and exceeding swift, and indeed is of such use to the Laplanders, that it supplies the place of corn-fields and meadows, horses and cows. In winter they make use of the rein-deer in travelling ; its flesh, either fresh or dried, without salt, is their chief food ; and all their cloathing, from head to foot, consists of the skins of these animals. The rein-deer also supplies its owner with a bed, and both winter and summer, with good milk and excellent cheese ; besides, of the intestines and tendons he makes thread and cordage.

The Laplanders, with respect to their manner of living and habitations, consist of two different tribes, namely, the Forest and Mountain Laplanders. The former spend the greatest part of the summer in the woods, and have no property ; but the latter live among the mountains. The food of the former chiefly consists of fish and fowl ; but that of the latter principally depends on their herds of rein-deer. The Laplanders in general, and particularly the Foresters, are esteemed good marksmen. They have a great aversion to mining. In most of the lapmarks they make it their employment to carry the burghers to the yearly fairs ; and some of the Laplanders, for a reasonable reward, look after the rein-deer belonging to other people. Most of them choose rather to sleep away the whole day in their tents, than to engage in any laborious employment ; but those whom want has prompted to industry, give evident proofs that they are not without a capacity for mechanic trades, nor even for exquisite pieces of workmanship. Their boats and utensils are plain indications of their skill, and some of their sledges are inlaid with horn in a variety of figures. Their horn spoons, their Runic calendars, their moulds for casting pewter utensils, their bows and arrows, and the like, are all of their own making.

The Lapland women make use of a horn perforated with large and small holes, through which they draw tin or pewter into wires of different thickness, with which they neatly embroider their girdles, cloaths, and sledge furniture. They also prepare all kinds of skins by various methods, and cut out and sew the habits used among them.

Several Laplanders, besides the herds of rein-deer, are masters of a considerable quantity of silver in rings, buckles, large and small spoons, cups, &c. and money grows

grows daily more and more in use among them: but they prefer the Holland rixdollar to all other coins, because the Norwegians, with whom they trade in summer, will not take any other money in exchange for their goods. The rest of their substance consists of domestic utensils and other furniture, as tents, iron pots, copper and brass kettles, furs and other cloaths, bed-furniture, fine sledges with harnesses, hatchets, boats, and fishing-tackle. As to the poorer sort, they are obliged to be satisfied with fewer conveniencies.

As feeding their herds of rein-deer is the chief employment of the Laplanders, they frequently shift their habitations. At the approach of spring most of them move with their families twenty or thirty Swedish miles among the mountains of Norway as far as the North Sea, where they fix their abode till autumn, and then quit the mountains and return to the south, to prevent their being frozen to death for want of fuel; and their rein-deer being starved, there being little or no moss so far to the north.

The other Laplanders, who make no excursions to the mountains, but dwell in the village districts, or live by fishing, likewise never settle in one place: to this they are obliged by their rein-deer, which at certain times shew a disposition to remove, either from the want of fodder, or their being sensible of the changes that will happen in the weather.

This unsettled way of life obliges the Laplanders to provide portable dwellings, and such are their tents, which are thus formed: they first set up several poles in a circular position, gradually closing together on the top, much in the form of a sugar-loaf with the top of it broken off. Over these poles they lay a kind of coarse cloth, and thus form tents, some of which are sufficient to contain twenty persons. The hearth is in the middle, with stones laid round it, to prevent the fire from spreading. An aperture is left at the top, where the poles almost join, which serves both for chimney and window. From this hole hang two chains with hooks at the end, to hang the pots on, in order to boil their victuals, or melt the ice or snow into water to drink. Round the inside of the tent they lay their cloaths to keep out the cold wind, and spread branches of birch or fir round the tent, by way of seats to sit upon; for they have neither chairs, stools, nor benches. About the tent stand the cupboards, where they keep their provisions; these are fixed on posts or blocks of wood, and have some resemblance to pigeon-houses erected on pillars. The Laplanders, whenever they have an opportunity, pitch their tents near dried pines, for the convenience of fuel; but in spring and autumn they are forced to be contented with brush-wood. It ought not to be omitted, that in some of the lapmarks they erect boarded cottages, or wooden houses, that resemble those of the Swedes.

Their carriages are sledges shaped like small boats with a broad keel, and so thick, that no water can penetrate through them. They have a back-board for the traveller to lean against, who sits fast laced in the sledge, and well secured from the cold. This vehicle is drawn by the rein-deer with incredible swiftness through the snow over mountains and valleys. The rein-deer is harnessed with a large cloth girt, embroidered with pewter wire, and fastened on his back. The bit is a piece of leather tacked to the reins of the bridle over the deer's head and neck, and from the breast a leather strap passing under the belly is fastened to the fore-part of the sledge, which serves instead of shafts. The rein-deer in a great measure lose their vigour and swiftness in summer, when these are less necessary; but even then they are very proper for carrying the Laplanders effects from one place to another.

The Laplanders also use a kind of skates, like those used by the Fins and Nordlanders. These consist of a board three or four Swedish ells in length, and six inches broad, ending in a point which turns up before. With these boards fastened to their feet, and a pole, with a round piece of wood at the end to prevent its sinking too deep into the snow, the Laplanders slide along with such swiftness, as to overtake wolves and bears.

The Laplanders who practise fishing, and live in South Lapmark, make use of a kind of boat or little bark for

crossing rivers, made of slight boards curiously joined together with filaments of the roots of trees, or hempen strings, and are so light that a Laplander carries his boat on his shoulders, with the oars and every thing belonging to it, besides his bag of provisions. These boats they steer with amazing dexterity, even among the rocks and down the most rapid water-falls; and though the cataract be ever so dreadful, and the Laplander ever so great a stranger to it, he undauntedly ventures down the precipice in his little boat: but when he steers against the stream, and comes to a water-fall, he puts ashore, takes his boat upon his back, and travels till he comes to smooth water.

In the Northern lapmarks they have larger boats, four or five fathoms in length; these they either haul up the great water-falls with ropes, or where the cascades are small, shove them up with poles; which is done by two men, one of whom sits at the head, and the other at the stern. As for going down the water-falls with the stream, they consider it as attended with no difficulty.

The Mountain Laplanders in summer live chiefly upon milk, and of the cheese made of it, of which they lay up a store for winter. In the month of September, before the piercing frosts set in, they kill as many of their rein-deer as they think will serve them till Christmas: afterwards they kill as many as will supply them for the rest of the winter, and sometimes kill one or two occasionally. It is not unusual with the Western Laplanders to buy Norway cows and sheep in summer, which they kill for their winter provision. They also eat the flesh of bears and beavers, sea and wild fowl, &c. The poor who live in villages are contented with the flesh of dogs, wolves, foxes, and horses, when they can get them. The Fishing Laplanders live on fish, which they have various ways of dressing; and those who have rein-deer on their high days and festivals, dress flesh and fish together. In summer they buy their salt of the Norwegians, and in the winter purchase it of the burghers. Tobacco is not very uncommon among them; but they buy it at a very high price. In this country none of the women have any hand in dressing provisions, that office belonging to the master of the house. They never omit saying of grace before and after meat, nor shaking one another by the hand before they rise from table.

S E C T. X.

Of the Marriages and Religion of the Swedish Laplanders; their Sorcerers, and the Manner in which they pretend to foretel future Events by their Magic Drums. The Government, Trade, and Divisions of Lapland.

THE marriages of the Laplanders depend entirely on the pleasure of their parents, who pay no regard to the inclinations and affections of their children; and it is said that a widow, though decrepid with age, and both deaf and blind, will never want suitors, if she be but rich. They seem to disapprove of marriages between relations, and even intimate friends: as to polygamy, it has never obtained amongst them. When the parents have determined to choose a daughter-in-law, they take their son, let him be ever so unwilling, and accompanied by some of their near relations, go to the dwelling of the son's future father-in-law, always taking some brandy with them. This liquor is the first and most powerful pleader in their behalf, and the acceptance of it is esteemed a good presage of success; but if the treaty comes to nothing, the young woman's parents are obliged to pay for all the brandy used during the courtship. If the marriage takes place, an agreement is made about the money and goods which the parents of the bridegroom are to give to those of the bride. In return, the bride's parents are obliged to give the new-married pair as much furniture and as many rein-deer as are esteemed an equivalent for the presents they have received. Those who are poor marry without any of these previous ceremonies, every one at such times providing according to his ability. The marriages are solemnized in the churches; and the bride usually feigns such timidity, and shews such reluctance, that force is sometimes obliged to be used to get

get her thither. After the ceremony the company return to their tents, where they have a feast, every one bringing his portion of provisions, which are all dressed and served up together.

The children are inured to hardships from their infancy: they are first securely laced up in little cradles, which are suspended in the smoke near the top of the tent, and rocked by pulling two cords that hang down from each side. They are very careful when they begin to grow up, to teach them to earn a comfortable subsistence, by accustoming them to all kinds of work practised among them; but they have a great aversion to schools.

Though the inhabitants of the Swedish lapmarks make an outward profession of Christianity, yet the greatest part of them are most grossly ignorant, and shew no other signs of their having embraced that religion, than by being baptized and called by Christian names. Indeed they are extremely tenacious of their pagan rites and customs, which proceeds from the high idea they entertain of their ancestors, and their willingness to believe that whatever they did must be reasonable, just, and worthy of commendation.

Those who are still pagans call the Supreme God by the name of Jubmal, and term the prince of the evil spirits Perkmel. As they attribute to this last spirit a power equal to that of God, they endeavour to obtain his favour and render him propitious, in order that he may not hurt them. Besides these, and some other deities, they have a number of demi-gods. They make images both of wood and stone, but pay the greatest reverence to the latter. When the Laplanders come within sight of the place where the idol stands, they uncover themselves, make low bows, and creep on their hands and feet up to the idols, in order to make their offerings.

Much has been said of the sorcery practised by these people; but fame has magnified their skill far beyond the truth. Few of the Laplanders pretend to have any skill in magic, and when any thing singular seems to be brought about by their magicians, it causes as much admiration as among other nations. They are indeed persuaded that their forcerers, by repeating mystical words, or by some other means, can restore health to the sick, give tidings of goods stolen, and have it in their power to injure their neighbours.

Almost every body has heard of their magic drums; but they are so cautious in the use of them, that their own countrymen scarce know any thing about them; for if they are detected in using them, it costs the pretended magician his life. They are supposed to use these drums as oracles; for they imagine, that by means of various figures painted on the head of the drum, they can know what passes in distant places; whether they shall meet with success in hunting; what offerings will be most acceptable to their gods; with the causes and cures of certain diseases.

We are told that M. Motraye, who travelled through Lapland in 1718, hired a guide to direct him to the tent of one of these magicians in the most remote part of Lapland; but was first obliged to give the guide all imaginable assurances that he would not betray him to the government. He found the wizard in a poor hut, and in as wretched circumstances as can be imagined. This miserable magician gave M. Motraye his hand, and ordered him to follow him to the top of a high mountain, where he desired him to stay while he fetched his drum and other utensils. Soon after the Laplander returned with his magic drum, which he had concealed among the shrubs for fear of a discovery. It was of an oval form, and had but one head, which was covered with a kind of transparent parchment, wretchedly painted with the celestial signs; and to it was fastened a chain with several brass rings. Before the operation began, the wizard de-

manded if they had any brandy; and half a pint of that liquor being given him, he immediately drank two-thirds of it. He then put the chain and rings into the inside of his drum, and turning the bottom upwards, beat upon it with a forked piece of a rein-deer's horn for a few minutes, the rings all the while jumping about and making a jingling noise. After this he laid himself flat on his back, set the head of the drum on his bare breast, and shutting his eyes, pretended to be in a trance; but at length fetching a deep sigh, he gently raised the drum above his head, and looked at the rings, which he could easily discern through the transparent parchment. Having observed their position and distance from the figures of the celestial signs, he fixed his eyes upon M. Motraye, and declared he would run a great hazard of his life by water as he returned in his sledge, and would also be in great danger in going down the cataracts in a boat: that he would have another narrow escape from fire; and that his life would be long and healthful after he had overcome two fits of illness, both which would seize him within the space of two years. As for the Lapland interpreter who led M. Motraye to his cell, he directed him to go out to fish on some particular days in that and the following month, when he should return home laden with fish: he also pretended to tell him on what days he would be equally fortunate in hunting. M. Motraye asked if he could tell whether he was a bachelor or a married man, into what countries he had travelled, and other questions of the like nature; but this pretended magician was too wise to guess at things that were past, in which he knew his ignorance must be instantly discovered.

With respect to the government of this country, the Laplanders in general acknowledge the king of Sweden for their rightful sovereign; though some of them also pay tribute to Denmark and Russia, as at certain seasons they pitch their tents within the dominions of those crowns. They, however, conform to the Swedish laws; some of them attend the celebration of divine service in the Swedish churches, and apply to the Swedish courts of judicature established all over Lapland.

The judges assistants are chosen from among the Laplanders, and the taxes are usually paid at the time when those courts of justice are held. At the places appointed for these courts, and for levying the taxes, are houses and tents, erected by the Laplanders for their own convenience, with houses and shops that are let to the burghers who frequent the annual fairs. The most considerable of these fairs are held at the same time with the courts of justice, and in some provinces last about a fortnight, but in others only a few days. The goods which the Laplanders buy from the inhabitants of the towns are chiefly tobacco, salt, meal, cloth, a kind of coarse cloth called walmar, kettles, pots, silver spoons, buckles, girdles, rings, cups, needles, laces, hatchets, knives, scissars, lead, powder, fire-arms, tin, or pewter, sulphur, wine, malt-liquor, figs, &c. The Laplanders in return sell to the inhabitants of the towns furs of all kinds, the flesh and skins of rein-deer, fur gowns, boots, shoes, fish, cheese, &c. There are neither towns nor any fixed or measured miles used in any of the lapmarks.

Lapland is divided into seven lapmarks, or provinces, which receive their names from the places of note in Nordland in whose neighbourhood they lie. They all belong to the government of West Bothnia, except Jamtland lapmark, which is included in the government of West Nordland. We might here give an account of each of these lapmarks, but as it would afford neither any useful instruction nor entertainment to the reader to describe petty villages, consisting of a few little wooden houses, or huts, and a church resembling a barn, we shall conclude our account of Swedish Lapland, and proceed to Norway, which bounds it to the west.

C H A P. VI.

O F N O R W A Y.

S E C T. I.

Of the Situation, Climate, Coast, Mountains, Roads, Bridges, and Face of the Country in Norway. Of the different Kinds of Marble, and other Stones; with a particular Account of the Asbestos, or Amianthus, a Sort of incombustible Flax; and of the Mines of that Country.

NORWAY, which is called by the Danes and the Norwegians themselves Norge, is bounded on the north and west by the North Sea, on the east by Swedish Lapland and Sweden, and on the south by the sea called the Categate, extending in length from the fifty-seventh degree forty-seven minutes to the North Cape in the seventy-first degree thirty minutes north latitude, and in breadth from the fourth degree thirty-five minutes to very unequal distances within land, it being in some places two hundred and eighty, in others about a hundred and fifty, and in others not above thirty miles broad.

In most parts of Norway the air is pure and salubrious, but more so in the middle and east side than on the western coast; for in the latter the air is damp, and the western extremely variable, on which account scorbutic disorders are very common among the Norwegians.

In the summer nights the horizon, when unclouded, is so clear and luminous, that at midnight one may read, write, and do all kinds of work as in the day; and in the extremity of this country, towards the islands of Finmark, the sun is in the midst of summer continually in view, and is observed to encircle day and night the north pole, contracting its orbit and then gradually enlarging it, till at length it leaves the horizon. On the other hand, in the depth of winter the sun is for some weeks invisible, all the light perceived at noon being a faint glimmering that continues about an hour and a half, which, as the sun does not then appear above the horizon, chiefly proceeds from the reflection of the rays on the highest mountains, whose summits are seen more clearly than any other objects; but the bountiful Creator has granted the inhabitants all possible assistance; for besides the moon-shine, which by reflection from the mountains is rendered exceeding bright in the valleys, the people receive considerable relief from the aurora borealis, or northern lights, which frequently afford them as much light as is necessary for their performing their ordinary labours.

In the western parts of this country the cold of winter generally sets in about the middle of October, and continues till the middle of April. The waters are congealed to a thick ice, and the mountains and valleys covered with snow: yet even this is of such importance to the welfare of the country, that in a mild winter the peasants, who live among the mountains, are considerable sufferers; for without this severe frost and snow, they can neither convey the timber they have felled to the rivers, nor carry their corn, butter, furs, and other commodities, in their sledges to the market-towns; and after the sale of them carry back the necessaries with which they are there supplied: for the largest rivers, with their roaring cataracts, are arrested in their course by the frost, and the very spittle is no sooner out of the mouth than it is congealed, and rolls along the ground like hail. But the wise Creator has given the inhabitants of this cold climate a greater variety of preservatives against the weather, than most countries afford. Extensive forests supply them with plenty of timber for building and for fuel; the wool of the sheep, and the furs and skins of wild beasts, furnish them with warm lining for their cloaths, and covering for their beds; innumerable flights of wild fowl supply them with down and feathers; the mountains themselves serve them for fences against the north and east winds, and their caverns afford them shelter.

While the winter thus rages in the east of Norway, the lakes and bays on the west side are kept open by the warm exhalations of the ocean, though lying in a direct line with these frozen eastern parts; and the frosts are seldom known to last above a fortnight or three weeks. Even in the centre of Germany, which is two hundred leagues nearer the line, the winters are generally more severe, and the frosts sharper than in the diocese of Bergen; for the inhabitants here are often surprized at reading in the public papers of frost and snow in Poland and Germany, when they feel no such weather; and the learned Dr. Pontoppidan observes, that the harbours of Amsterdam, Hamburg, Copenhagen, and Lubec, are much oftener froze than those of Norway, where this seldom happens above two or three times in a whole century. Thus the winter at Bergen is so moderate, that the seas are almost always open to the fishermen and mariners; and there the North Sea continues navigable during the whole winter as far as the eightieth or eighty-second degree. Thus while the inhabitants of the eastern parts have by means of the ice and snow the convenience of bringing their commodities in sledges to the market-towns, those of the western side on the sea coast are at the same time employed in their profitable fisheries. However, Bergen, and all the eastern coast, is so subject to frequent rains, that the men, whenever they go abroad, wear rain-hats made like umbrellas, and the women in all weathers secure themselves by wearing a woollen or silk black veil over their heads.

In summer the weather is not only warm but extremely hot. These violent heats, which are, however, of short duration, may be partly derived from the valleys inclosed within high mountains, where the reverberation of the rays of the sun on all sides heat the air; and as there is almost no night, neither the atmosphere nor the mountains have time to cool. Indeed there cannot be a more decisive proof of the summer's heat in Norway, than that several vegetables, and particularly barley, in some places grow up and ripen within six weeks or two months.

With respect to the coast, that on the west of Norway is surrounded by a great number of islands and rocks, some of the former being three, six, or nine Norway miles in length, and pretty fertile; but most of them are small, and inhabited by only a few fishermen and pilots. The rocks, which rise several fathoms above the surface of the water, are a kind of rampart that defends the coast, and amount to some hundred thousands. They form a-bundance of good harbours; and in many places iron rings are fastened to them for mooring ships, where there is not sea-room or good anchorage. As the water is calm and smooth, they are of great service to coasters, the violence of the waves being broken against these barriers, while the open places are very dangerous, and every year prove fatal to many small vessels. The shore of Norway is generally steep and perpendicular, so that close to the rocks, the depth of the sea is from a hundred to two, three, or four hundred fathoms.

Several gulphs and creeks run forty, fifty, and sixty miles into the land, and in some of them, which are but from fifty to a hundred fathoms in breadth, runs a narrow channel four hundred fathoms deep; but on the sides the depth does not exceed a hundred fathoms.

As the country is extremely mountainous, the arable land is but little in comparison of the waters and desarts, which obliges the inhabitants to procure half their subsistence from the sea. Hence the villages are small, and the houses scattered among the vallies: in some places, however, those of the peasants stand so high on the edge of steep precipices, that ladders are fixed to climb up to them; so that when a clergyman is sent for, who is unused to the road, he risks his life in ascending them, especially in winter, when the ways are slippery. In

such places the bodies of the dead are let down with ropes, or brought down on men's backs, before they are laid in a coffin; and at some distance from Bergen, they are obliged in winter to draw the mail over the steepest mountains.

One of the principal inconveniencies experienced by travellers arises from the roads; for they cannot, without terror, pass even the king's road, which in several places extends up the sides of steep and craggy mountains on ways that are either shored up, or suspended by iron bolts fixed in the mountains; and, though not above the breadth of a foot path, have no rails on the side. If two travellers were to meet there in the night, and not see each other soon enough to stop where the road will suffer them to pass, they must stop short, without being able to pass by each other, or to find a turning for their horses, or even to alight. The only resource I can imagine in this difficulty, says the bishop of Bergen, is, that one must endeavour to cling to some cliff of this steep mountain, or, if help be at hand, be drawn up by a rope, and then throw his horse headlong down a tremendous precipice, in order to make room for the other traveller to pass.

The caverns of the mountains also afford shelter to the wild beasts, which render it difficult to extirpate them; and it is not easy to describe the havoc made by the lynxes, foxes, bears, and especially wolves, among the cattle, goats, hares, and other useful animals.

Another disadvantage is, that the cows, sheep, and goats belonging to the peasants often fall down the precipices, and are destroyed. Sometimes they make a false step into a projection called a mountain-hammer, where they can neither ascend nor descend: on this occasion a peasant cheerfully ventures his life for a sheep or a goat; descending from the top of a mountain by a rope of some hundred fathoms in length, with his legs over a cross stick, till he sets his foot on the place where he finds his goat, when he fastens it to the rope, and it is drawn up along with himself. But the most amazing circumstance is, that he runs this risk with the help of only a single person, who holds the end of the rope, or fastens it to a rock, if there be one at hand proper for that purpose. There are instances of the assistant himself having been dragged down, and sacrificing his life from his fidelity to his friend, on which both have perished. When a man or beast has thus the misfortune to fall some hundred fathoms down the precipices, it is observed, that the air presses with such force against the bodies thus falling, that they are not only deprived of life for some time before they reach the ground, but their bellies burst, and their entrails come out, which is plainly the case when they fall into deep water.

From the multitude of springs that issue from the mountains, and the vast masses of snow accumulated on their summits, which gently dissolves in summer, are formed many lakes, in some of which are floating islands, and a considerable number of rivers, the largest of which is the Glommen, or Glamer; but none of them are navigable far up the country: the passage being every where interrupted by rocks, and in some places by dreadful cataracts, in which the stream precipitates itself from the height of forty, fifty, and even a hundred fathoms. The bridges over these rivers are not walled, but formed of timber cases filled with stones, which serve for the piers on which the timbers are laid. The largest bridge of this kind has forty-three stone cases, and is a hundred paces in length. In those places where the narrowness and rapidity of the current will not admit of sinking these cases, thick masts are laid on each side on the shore, with the thickest end fastened to the rocks: one mast being thus laid in the water, another is placed upon it, reaching a fathom beyond it, and then a third or fourth in like manner to the middle of the stream, where it is joined by other connected masts from the opposite side. Thus in passing over the bridge, especially in the middle, it seems to swing, which to those who are not used to these bridges appears extremely dangerous, so that filled with terror they alight from their horses, and lead them over.

The mountains of Norway are, however, attended with some advantages: a great chain of them serves as a

barrier between this country and Sweden; and besides, they exhibit the most delightful prospects; for here nature has added greater beauties to the situation of cottages and farm-houses, than in other countries can be enjoyed by royal palaces, though assisted by all the varieties of groves, terraces, canals, and cascades. A predecessor of mine, says the bishop of Bergen, is said to have given the name of the Northern Italy to the district of Waas, which lies some leagues to the eastward of Bergen; and certainly there cannot be a more enchanting prospect. All the buildings in it are the church, the parsonage, and a few farm-houses scattered on different eminences. The beauty of the place is much heightened by two uniform mountains gradually rising to a vast height, betwixt which runs a valley near half a league in breadth, and a river which sometimes precipitates itself down the rocks in foaming cataracts, and at others spreads itself into small lakes. On both sides it is bordered with the finest meadows intermingled with little thickets, and by the easy declivities of the verdant mountains covered with fruitful fields and farm-houses, standing above each other in a succession of natural terraces. Between these a stately forest presents itself to the view, and beyond that the summits of mountains covered with perpetual snow, and ten or twelve streams issuing from the snowy mountains, form an agreeable contrast in their meanders along the blooming sides of the hills, till they lose themselves in the rivers beneath.

Within the bowels of some of the mountains are several of the most beautiful kinds of marble, some white, others veined with blue, and others variegated with a variety of colours: there is likewise black marble spotted with white, green marble with greyish veins, and blue marble with white veins. They also contain such quantities of the magnet or loadstone, that some tons of them have been exported: they likewise yield the asbestos, of which incombustible linen and paper have been made.

It will not be unentertaining to the reader to see here a particular account of the asbestos, or amianthus, as described by Dr. Pontoppidan, bishop of Bergen: "Having heard of some wood petrified by a certain spring, I wrote, says he, for some samples, and a large parcel of it was sent me. At first I thought it resembled hazle, that had lain a long time in the water; but upon a narrower inspection, and drawing out some of the filaments, I found it to be amianthus, much finer than the Greenland stone-flax, which the reverend Mr. Egede says is used there as wicks in the lamps, without being in the least wasted, while supplied with oil or fat. This amianthus, from the softness and fineness of its fibres, deserves to be called stone-silk, rather than stone-flax: I also made a wick for a lamp of it, and it was not consumed; but its light being much dimmer than that produced by cotton, I laid it aside. I have also in my possession a piece of paper of this asbestos, which when thrown into a fierce fire is not in the least wasted; but what was written on it totally disappears.

"The manner of preparing this stone-silk or stone-flax is this: After its being softened in water, it is beaten with a moderate force, till the fibres, or long threads, separate from each other; afterwards they are carefully and repeatedly washed till clear of all terrene particles; then the flax is dried in a sieve: all that remains now is to spin these fine filaments, wherein great care is required; besides which the fingers must be softened with oil, that the thread may be the more supple and pliant."

Though this country thus abounds in stones, no flints have yet been found there, so that those for fire-arms are imported from Denmark or Germany: but though there are no flints, there are amethysts, garnets, chalcedonies, agate, jasper, and crystals.

Norway formerly produced gold; but the expence of working the mines, and separating the gold from the ore, being greater than the profit, they have been neglected. There are, however, silver mines, which are extremely valuable, and give employment to several thousand persons. The copper-mines are also extraordinary rich, and employ great numbers: one of the most profitable productions of this country is iron, several hundred thousand

sand quintals being annually exported chiefly in bars, and the rest cast into cannon, kettles, stoves, and the like. Here are likewise some lead-mines, but none of tin or quicksilver.

S E C T. II.

Of the Corn, Fruit, and Trees; Beasts, Insects, Birds, and Fishes of Norway.

THOUGH this country is situated so far to the north, it produces rye, barley, white, grey, and green peas, vetches, which are used as provender for horses; hops, flax, and hemp; many kinds of roots and greens for the kitchen, with a considerable number of hardy flowers. There are several kinds of cherries, of which the peasants sell great quantities dried; there are also many sorts of wholesome and well-tasted berries, as strawberries, raspberries, red and white currants, red and white gooseberries, sun-berries, barberries, bilberries, cranberries, blackberries, and many others; several kinds of plums attain to a tolerable ripeness; but this is seldom the case with peaches, apricots, and grapes. However, several sorts of apples and pears are found all over the country; but the greatest part of these are summer fruit, which ripen early; for winter fruit seldom come to perfection, except the summer proves hotter, and the winter sets in later than usual. But though Norway is inferior with respect to its fruits than many other countries in Europe, yet this deficiency is compensated by its inexhaustible forests, from which most of the provinces are enabled to receive immense sums from foreigners for beams, masts, planks, and boards; besides the great consumption for houses built at home, entirely of beams of wood, ships, bridges, and a prodigious number of foundries, which require an immense quantity of charcoal in the fusion of metals; to which we must add, that in many places the woods are felled only to clear the ground, and are burnt for the sake of the ashes, which serve for manure.

In treating of the animals in Norway, we shall begin with the horses, which are of greater use in riding than in drawing; they have an easy pace, are full of spirit, and very sure-footed. When they mount or descend a steep rock on stones, like steps, they first tread gently with one foot, to try if the stone they touch be fast, and in this they must be left to themselves, or the best rider will endanger his neck; but when they are to go down a very steep and slippery place, they, in a surprising manner, draw their hind-legs under them and slide down. They shew great courage in fighting with the wolves and bears, which is very usual with them; for when a horse perceives any of these furious animals advancing towards him, and has a mare or gelding with him, this generous animal places them behind him, and then attacks his antagonist, by striking at him with his fore-legs, with such courage, that he commonly remains conqueror. Both the Norway horses and cows are generally of a yellowish colour, but the latter are small, and yield no great quantity of milk; however, their flesh has a fine grain, is juicy, and well-tasted. The sheep are also small, and resemble those of Denmark.

In many places the goats run wild in the fields, both in winter and summer, till they are ten or twelve years old, and when the peasant to whom they belong is resolved to take them, he must either do it by some snare or shoot them: They are so bold, that on the approach of a wolf, they stay to receive him, and if they have dogs with them, will resist a whole herd. They also frequently attack the snakes, and when they are bit by them, not only kill, but eat them, after which they are never known to die of the bite, though they are ill for several days. If these goats are tame, the owner warms their own milk, and with it washes the wound.

The bishop of Bergen observes, on mentioning these animals, that near Rostadt is a flat and naked field, on which no vegetable will grow. The soil is almost white, with grey stripes, and has somewhat so peculiarly poisonous in its nature, that though all other animals may safely pass over it, a goat or kid no sooner sets its foot upon it,

than it drops down, stretches out its legs, its tongue hangs out of its mouth, and, if it has not instant help, it expires.

Norway has few swine, and not many of the common deer; but the hares, which in the cold season change from brown or grey to a snow white, are very cheap in winter. In some parts of the country there are elks, but they are not numerous. The rein-deer, however, run wild in herds, and are shot for food by the inhabitants. Of these animals we have given a description in treating of Swedish Lapland; but the author just mentioned takes notice of one or two particulars that ought not to be omitted: he says that when the rein-deer sheds his horns, and others rise in their stead, they appear at first covered with a skin, and till they are of a finger's length, are so soft, that they may be cut with a knife like a sausage, and are delicate eating, even when raw. The hunters, therefore, when far out in the country, and pinched for want of food, eat them, and find that they satisfy both their hunger and thirst. But when the horn is grown, there breeds within the skin a worm, which eats away the root. The same gentleman also takes notice, that the rein-deer can draw over his eyes a kind of skin, through which he can see, when otherwise in the hard snows, he would be obliged to shut his eyes entirely: a singular instance of the wisdom and benevolence of the Creator, in providing for the wants of each creature according to its destined manner of life.

Besides the bears and wolves, already mentioned, there are here the lynx; vast numbers of white, red, and black foxes; and the glutton, which receives its name from its voracious appetite. Those of this country, in their shape and size, have some resemblance to a long-bodied dog, with thick legs, sharp claws and teeth; his colour is black, variegated with brown and yellowish streaks: he has the boldness to attack every beast he can possibly conquer, and if he finds a carcase six times as big as himself, he will not leave it, while there is any left: when fully gorged, says our author, he presses and squeezes himself between two trees that stand near together, and thus empties himself of what he has not time to digest. As his skin shines like damask, and is covered with soft hair, it is much valued, and it is therefore well worth the huntsman's while to kill the animal without wounding the skin, which is done by shooting him with a bow and blunt arrows.

The marten is likewise hunted for the sake of its skin; as are also the ermine and the squirrel, both of which are shot with blunt arrows. The skin of the ermine is of a beautiful white, and it has a black spot on the tail. These little animals run after mice like cats, and drag away what they catch, particularly eggs, which are their greatest delicacy. Here are also otters, castors, hedgehogs, and badgers.

Among the mice, some are thought poisonous, and others are remarkable for their being white, and their having red eyes. But the most pernicious vermin is a little animal called the læmus or lemming, which is between the size of a rat and a mouse; the tail is short, and turned up at the end, and the legs are also so short, that they scarce keep the belly from the ground. They have very soft hair, and are of different colours; particularly black, with yellow and brown in streaks, and some in spots. About once or twice in every twenty years, says our reverend author, they assemble from their secret abodes in prodigious numbers, like the messengers of heaven to punish the neighbouring inhabitants. They proceed from Kolen's rock, which divides the Nordland manor from Sweden, and is held to be their peculiar and native place, marching in vast multitudes through Nordland and Finmark to the western ocean; and other bodies of them through Swedish Lapmark to the Sinus Bothnicus, devouring all the grass and vegetables in their way. They do this in a direct line, and going straight forward, proceed into the rivers or the sea: thus, if they meet with a boat in any river, they run in at one end, or side, and out again at the other, in order to keep their course. They carry their young with them on their backs, or in their mouths, and if they meet with peasants who come to oppose them, they will stand undaunted, and bark at them like dogs. This evil is, however,

however, of short duration; for on entering the sea, they swim as long as their strength lasts, and then are drowned. If any are stopped in their course, and unable to reach the sea, they are killed by the frosts of winter, and if any of these escape, most of them die as soon as they eat the new grass.

With respect to the reptiles, toads and snakes are only in the southern parts of this country, and these snakes are less poisonous than in warmer climates. There are lizards here of various colours, as brown, green, and striped: those that are green are found in the fields, and the others in the cracks and holes in the rocks.

There are here most of the fowls to be found in the rest of Europe, and some that appear peculiar to this country. Among the former are common poultry, turkeys, tame and wild geese, peacocks, ducks, and pigeons; nightingales, larks, quails, partridges, starlings, wrens, magpies, bats, water-wagtails, storks, herons, gulls, owls, ravens, cormorants, falcons, eagles, and many others. Of the latter, there are only two species, the rock-eagle and the fish-eagle; the former is somewhat less than the other, and spotted with grey; it haunts the highest places in the country, and frequently kills hares, sheep, lambs, and the like animals, as well as birds. The farmers here say, that he will sometimes attack a deer, in which case he makes use of the following stratagem: he soaks his wings in water, and then covering them with sand, and flying against the deer's face, blinds him for a time, when the pain makes him run about as if mad, and he frequently falls down a rock and breaks his neck, upon which the eagle seizes upon him for his prey. There are also many accounts of their carrying away young children.

The fish-eagle is of a larger size, and of a light brown. Though it does not dislike a dead carcase on shore, it lives principally on fish, which it often takes from the otters, and frequently seizes fish on the surface of the water. When this bird flies out to sea, in order to strike a fish with his talons, he sometimes lays hold of such as are too strong for him, particularly the fish here called the queite, whose high and prominent back makes him appear much less than he really is: when the eagle strikes his talons into him, he cannot easily disengage them, on account of their crookedness and length, in which case the fish drags him down with him; while the bird, making a miserable cry, strives to keep himself up, and works with his wings spread as long as possible, though in vain; for at last he must yield, and fall a prey to those he intended to devour. Our author mentions another instance, in order to shew that this king of birds, as he is called, extends his attempts beyond his power. Near Bergen, an eagle standing on the bank of a river, saw a large salmon as it were just under him; on which he instantly struck one of his talons into the root of an elm near it, and partly hanging over the river, struck the other into the salmon, which being large and strong, swam away, and split the eagle to his neck.

Among the birds in a manner peculiar to this country is the francolin, an excellent land-bird, which serves the Norwegians instead of the pheasant, its flesh being white, firm, and of a delicious taste.

The great northern diver is a pretty large sea bird, bigger than a goose. It has a long neck, the upper part of which is black, as well as the beak and feet; but from the breast downwards it is white. There are also some white feathers at the extremity of the wings and tail. The wings are so short, that they can hardly raise themselves with them; and the legs stand so far backward, that they are less fit to walk with than to paddle along the water, on which account they are seldom seen to come ashore. They are said to lay but two eggs, and that under their wings there are two pretty deep holes big enough to put one's fist in. In each of these they hide an egg, and hatch the young ones there as perfectly, and with less trouble than others do on shore.

The Norwegian parrot is a middle-sized sea bird somewhat larger than a pigeon. Its feathers are black and white, and its beak, which is hooked like that of a parrot, is striped with yellow, red, and black, and so sharp, that when he bites any of the bird-catchers, he takes away a piece of flesh: his claws are also very sharp, with

which, and his beak, he defends himself against the raven, whom he holds by the throat, and will carry out to sea, and drown him before he loses his hold. This bird builds his nest in a slanting hole in the ground, two or three ells deep, and also between the clefts of the rocks.

The black cap is almost as small as the wren; the body is black and yellow, white under the belly, and the top of the head black. These birds keep near the houses, and are such lovers of meat, that the farmers can hardly keep them from it, and therefore catch them in a trap like mice. In short, there are such incredible numbers of sea and land fowl near the rocks on the sea shore, that they sometimes obscure the sight of the heavens for many miles out at sea, so that one would imagine that all the fowls in the universe were assembled in one flock.

Norway is also as plentifully supplied with fish as any country in the world. There are here whales of several kinds, porpoises, sword-fish, and sharks; sturgeon, salmon, salmon-trout, turbot, cod, thornback, rock-fish, flying-fish, whiting, carp, gurnet, flounders, plaice, mackerel, herrings, bream, anchovies, eels, and many others well known in other countries.

Among those which are more uncommon is the fin-fish, which is forty feet or more in length; their liver alone yields several casks of train-oil. On their backs they have a high round and sharp bone, with which they tear open the bellies of other fish. They are covered with a kind of hair, something like a horse's mane, and are often seen about the boats of the fishermen, who are as much afraid of them as of the most dangerous sea monster.

The ink-fish, called by some the sea-gnat, is one of the most extraordinary creatures produced in the ocean, and are from nine inches to upwards of two feet in length. The head has two large eyes, and the mouth has some resemblance to a bird's beak; above which there stand two long arms or horns, each of which is octangular, and covered with a number of small round balls, somewhat longer than a pin's head. At the back of the head are two of these horns twice as long as the rest, and broader towards the end. The body is almost round; it resembles a small bag, and is blunt at both ends. On each side of it are two skinny membranes, with which the animal can cover itself over; and it assumes various forms by the motion of its skin and arms: but what must appear very extraordinary, the fore part of the body is filled with a black fluid, which makes the fish appear of a blue colour, though this fluid is of a fine black, and may serve for ink to write with. When these creatures are in danger, they discharge this liquid, which blackening the water all round them, they become invisible to their pursuers, and thus make their escape. Thus this otherwise helpless animal is provided by the wise Creator for its defence. If any of this black fluid happens to drop upon the hand, it burns like a caustic.

There are here also a vast variety of shell-fish, as lobsters, crabs, craw-fish, prawns, shrimps, oysters, muscles, cockles, sea-snails, star-fish, hermit-fish, and many others; one of the most curious of which is the sea-urchin, known also by the name of the sea-apple, a name that represents the size and figure of the thin and tender shell that surrounds this extraordinary fish, which are very common on the coast of Norway, where they are seen every day. They are of various sizes, from that of a walnut to the head of a new-born infant; some are of the form of a cone, and others are quite round, except the under part, which is pretty flat, and of these are the greatest number. The shell is covered with a multitude of small sharp prickles like small pins, which they probably shed once a year, and have new ones. When they are just taken out of the sea, they have a beautiful greenish lustre; but their greatest beauty appears when they are dried, boiled, and the prickles rubbed off. This consists in certain regular interchangeable stripes of a cylindrical form, running from the top to the bottom: some are white, others of an orange colour, others of a light red, and others of a deep red; and these stripes are strewed over with as many little white knobs as there were originally prickles. When this beautiful shell is broken, which is

easily done; there is found in it a quantity of slime and water, with a small fish, of a black or dark red colour; and from this little body there runs into all the turnings and windings of the shell a great number of fine threads, that seem only composed of a thicker slime, and have a communication with the external prickles; and between these is disposed in stripes a yellowish spawn. The fish lies stretched from the bottom to the top of the shell, where there is an almost imperceptible opening, through which the excrements pass. The mouth, which is extremely curious, is formed of five bones, part convex and part concave, all running to a small point; where they join together like the bill of a bird, and have some resemblance to a flower. The sea-urchin is found in a sandy bottom, where he rolls himself about on his prickles wherever he pleases.

S E C T. III.

Of the Persons, Dress, Houses, Food, and Employments of the Norwegians; with a particular Account of the extraordinary Manner in which they catch Fowl on the highest Rocks.

THE Norwegians are generally tall of stature, well made, and lively; yet those on the coast are said to be neither so tall nor so robust as those who inhabit the mountains, but are remarkable for being fatter and having rounder faces. The hair and eyes of the Norwegians are of a lighter colour than those of most other nations; and a dark complexion is as rare here, as a fair complexion in Italy. Indeed their eyes are generally blue or of a light grey; and they are in every respect a different people from the Laplanders, who lie farther to the north, and are of a smaller stature, have a flatter visage, a dark brown complexion, and black hair.

The Norwegians in general are brisk, active, and so ingenious, that the peasants employ neither hatters, shoe-makers, weavers, taylors, tanners, carpenters, joiners, or smiths: all these trades being exercised in every farm-house, and they think a boy can neither be an useful member of society, nor a good man, without becoming master of all these arts.

The Norwegians, who live in towns, have nothing remarkable in their dress; but the peasants do not trouble themselves about fashions. Those termed stire farmers have their breeches and stockings of one piece. They have a wide loose jacket, made of a coarse woollen cloth, as are also their waistcoat; and those who are fond of appearing fine, have the seams covered with cloth of a different colour. The peasants of one parish are remarkable for wearing white cloaths edged with black: the dress of another parish is black edged with red, and that of another is all black; others wear black and yellow: and thus the inhabitants of almost every parish vary in the colour of their cloaths.

They wear a flapped hat, or a little brown, grey, or black cap, made quite round, and the seams adorned with black ribbons. They have shoes of a particular construction without heels, consisting of two pieces, the upper-leather fitting close to the foot, and the sole being joined to it by many plaits and folds. In winter, and when they travel, they wear a sort of half boots that reach up to the calf of the leg, and are laced on one side; and when they go on the rocks in the snow, they put on snow-shoes: but as these are troublesome, when they have a great way to travel, they put on snow-skates, which are about as broad as the foot, but six or eight feet long, and pointed before; they are covered underneath with seal-skin, so that the smooth grain of the hair turns backwards to the heel. With these snow-skates they slide as fast upon the snow as upon the ice, and no horse can keep pace with them.

The peasants never wear a neckcloth, or any thing of that kind, except when they are dressed; for their neck and breast are always open, and they let the snow beat into their bosoms: on the contrary, they cover their veins, binding a woollen fillet round their wrists. About their body they wear a broad leather belt, a dorne with

convex brass plates, to which hangs a brass chain that holds their large knife, gimblet, and other tackle.

The women at church, and in genteel assemblies, are dressed in jackets laced close, and have leather girdles, with silver ornaments about them. They also wear a silver chain three or four times round the neck, with a gilt medal hanging at the end of it. Their handkerchiefs and caps are almost covered with small silver, brass, and tin plates, buttons, and large rings, such as they wear on their fingers, to which they hang again a parcel of small ones, which make a jingling noise when they move. A maiden-bride has her hair platted, and hung as full as possible with such kind of trinkets, as also her cloaths: for this purpose they get all the ornaments they can.

Their houses are generally built of fir and pine-trees, the whole trunks of which are only chopped even to make them lie close, and then laid one upon another, and fastened with mortices at the corners. These trunks are left round as they grow, both on the inside and outside of the house, and are frequently boarded over and painted, especially in the trading towns, which gives them a genteel appearance.

The people in the country villages build their houses at a distance from each other, with their fields and grounds about them. The store-house for the provisions is generally at a distance from the dwelling-house, for fear of fire, and placed high upon poles, to keep the provisions dry, and preserve them from mice and all kinds of vermin. The kitchen also stands separate, as do the cow-houses, barns, stables, and the like. A farm has generally a mill belonging to it, situated by some rivulet; besides a smith's forge. Up the country, where timber for building is of little value, there are many farm-houses as large as the seats of noblemen: these are frequently two stories high, and have a railed balcony in the front, and the additional buildings resemble a village. The common farm-houses have, however, only the ground-floor, and no other window but a square hole in the wall, which in summer is left open; but in winter, or in wet weather, is filled up with a wooden frame, covered with the inward membrane of some animal that is very strong, and as transparent as a bladder. This hole, which is as high as possible, also serves to let out the smoke, by answering the purpose of a chimney.

Under the above hole there is generally placed a long thick table, with benches round it; and at the upper end is a high seat, which belongs solely to the master. In the towns these houses are covered with tiles; but in the country the people lay over the boards the sappy bark of birch trees, which will not decay in many years. They cover this again three or four inches thick with turf, on which grass or moss always grows.

The people are remarkable for their civility, and are willing to do any one all the service in their power. Hence a traveller is seldom permitted to pay for his lodging; for they think it their duty to treat a stranger as well as they can, and think he does them an honour by accepting of their civilities: yet the peasant never gives his place at the upper end of the table to the greatest guest that ever comes under his roof; for he thinks that place belongs only to himself. They keep open-house at Christmas for three weeks, during which their tables are spread and loaded with the best provisions they can afford. At Christmas-eve their hospitality extends to the very birds, for whose use they hang on a pole at the barn-door an unthreshed sheaf of corn, which draws thither the sparrows and other small birds.

In the trading towns the inhabitants live with respect to provisions much in the same manner as the Danes; but the peasants keep close to the manners of their forefathers. Their oat-cakes are their common bread, but upon particular occasions, as at weddings, or other entertainments, they have rye bread. However, if grain be scarce, which is usually the case after a very severe winter, the peasants have recourse to what even they esteem a disagreeable method of preserving life, by boiling and drying the bark of the fir-tree, mixing it with a little oatmeal, and making it into a sort of bread. Even in times of plenty they eat a little of this, in order that when there is a scarcity, they may think it the less disagreeable.

The best dainties of the Norway peasants consist in milk, meats, and different sorts of cheese, on which they spread butter as on bread. The highland peasants are so fond of angelica, which grows very plentifully in the mountains, that they chew it in a morning dried, and also make snuff of it.

The mountains furnish the people with game, and the lakes and rivers with plenty of fresh-water fish. They kill cows, sheep, and goats for their winter stock, part of which they pickle and smoke, and some of it they cut in thin slices, sprinkle it with salt, then dry it in the wind, and eat it like hung beef. They are fond of brandy, and of chewing and smoking tobacco.

The peasants employ themselves in cutting wood, felling and floating of timber, burning of charcoal, and extracting of tar. Many are also employed in the mines, furnaces, and stamping mills; and also in navigation and fishing, besides hunting and shooting; for every body is at liberty to pursue the game, especially in the mountains, and on the heaths and commons, where every peasant may make use of what arms he pleases.

SECT. IV.

The Hardiness of the Norwegians; the Manner in which they carry on their Fishing, and their Agriculture; with their astonishing Methods of catching Fowl.

THE Norwegians are inured to cold and hardships from their childhood; for in the latter end of November they run about bare-foot, even upon the ice. The mountaineers who daily go in the woods have frequently their beards full of icicles, and their bosom full of snow. Our author says, that in his travels over the highest mountains of Norway, which are covered with snow, and where horses are of no service, he has seen the peasants in great numbers do the work of these animals, which they seem almost to equal in strength. When they have been in a profuse sweat, he saw them throw themselves every half hour upon the snow, for the sake of its refreshing coolness, and even sucked it to quench their thirst. This they undergo without the least apprehensions of a cold, or a fever, and without murmuring, or betraying the least discontent. On the contrary, they go on singing merrily, and with incredible cheerfulness and alacrity undergo the hardest labour imaginable for nine hours together.

The strong constitutions of the fishermen and seafaring people of this country are no less remarkable. The peasants of both sexes assemble together in prodigious numbers about the middle of January, to make their winter-harvest of the rich produce of the ocean. The people of every family at these times take with them five or six weeks provisions, which chiefly consist of dried fish. They keep out at sea all day and a great part of the night, by moon-shine in open boats; and after that crowd together by scores into little huts built in the islands near the coast, where they have hardly room to lay themselves down in their wet cloaths. Here they repose themselves the remainder of the night, and the next morning return to the same laborious employment with as much pleasure and cheerfulness as if they were going to a merry-making.

Agriculture in Norway is less burthensome to the farmer than in other parts; for he does not here toil in the fields of an oppressive lord; but the fruits of his labour, as in the British dominions, are his absolute and certain property. But, on the other hand, it is in many places attended with great inconvenience and fatigue: the fields consisting of little spots of ground among the rocks, many of which must be dug instead of being plowed, and particularly in the diocese of Bergen, where the soil is less fruitful, and affords few places where the plough can be used. Instead of this they sometimes use a crooked stick, with an iron at the end, which yielding easier to the stones, is not so subject to break. Nor is the harvest without its difficulties; the grain, according to the old custom of the peasants, not being mowed with a scythe, except about Christiana, where it is lately come

into use, but cut with a sickle; for the corn often grows so thick and close, and the stalks are so apt to bend with the weight of the ears, that the reapers grasp the stems with one hand, while they cut them with the other, and then bind them in sheafs: that they may be thoroughly aired and dried, a great number of poles are set up in the fields, and six or eight sheafs hung to each pole. No waggons are used in harvest work, except on the frontiers, where they have been introduced; but instead of them the Norway peasants use sledges, and are prejudiced against any other kind of vehicle, even in places where waggons might easily travel, though their work would be performed with much greater ease and expedition. But in this and every thing else they are so superstitiously tenacious of the customs transmitted to them by their forefathers, that they will not venture to move a stone which their parents had suffered to lie.

The catching of birds affords some of the inhabitants a very good maintenance: but it is impossible to give a just idea of the fatigue and danger with which the people search for the birds in the high and steep rocks, many of which are above two hundred fathoms perpendicular. These people who are called birdmen have two methods of catching them: they either climb up these perpendicular rocks, or are let down from the top by a strong and thick rope. When they climb up they have a large pole of eleven or twelve ells in length, with an iron hook at the end. They who are underneath in a boat, or stand on a cliff, fasten this hook to the waistband of the man's breeches who climbs, by which means they help him up to the highest projection he can reach, and fix his feet upon. They then help up another to the same place; and when they are both up, give each his bird-pole, and a long rope which they tie at each end round their waists. The one then climbs up as high as he can, and where it is difficult the other, by putting his pole under his breech, pushes him up, till he gets to a good standing-place. The uppermost of the two then helps the other up to him with the rope; and thus they proceed till they get to the part where the birds build, and there they search for them. As they have many dangerous places still to climb, one always seeks a convenient spot where he can stand secure by being able to hold himself fast, while the other is climbing about. If the latter should happen to slip he is held up by the other, who stands firm; and when he has passed in safety those dangerous places, he fixes himself in the same manner, that he may enable the other to come safe to him; and then they clamber about after birds where they please. But sometimes accidents happen; for if one does not stand firm, or is too weak to support the other, when he slips, they both fall and are killed; and every year some perish in this manner.

On their thus reaching the places that are seldom visited, they find the birds so tame, that they may take them with their hands, they being unwilling to leave their young; but where they are wild, they throw a net over them in the rock, and entangle those that are flying, with a net fixed to the end of their poles. Thus they catch a vast number of fowls, and the boat keeping underneath them, they throw the dead birds into it, and soon fill the vessel. If the weather continues favourable, and there be a great deal of game, the birdmen sometimes continue eight days together on the rocks; where they find holes or caverns, in which they can securely take their repose. In this case they draw up provisions with lines, and boats are kept coming and going to carry away the game they have caught.

As many of the rocks are so steep and dangerous, that they cannot possibly climb up them, they are then let down from above; when they have a strong rope, eighty or a hundred fathoms long, and about three inches in thickness. One end of it the birdman fastens about his waist, and then drawing it between his legs, so that he can sit on it, he is let down with his bird-pole in his hand, by six men at the top, who let the rope sink by degrees, but lay a piece of timber on the edge of the rock, for it to slide on, to prevent its being torn to pieces by the sharp edge of the stones. Another line is fastened round the man's waist, which he pulls to give signs when

when he would have them pull him up, let him lower, or keep him where he is. He is in great danger of the stones loosening by the rope, and falling upon him; he therefore wears a thick furred cap well lined, which secures him from the blows he may receive from small stones; but if large ones fall, he is in the greatest hazard of losing his life. Thus do these poor men often expose themselves to the most imminent danger, merely to get a subsistence for their families. There are some indeed who say there is no great hazard in it, after they are accustomed to it; but at first the rope turns round with them, till their heads are giddy, and they can do nothing to save themselves. Those who have learnt the art make a play of it; they put their feet against the rock, throw themselves several fathoms out, and push themselves into what place they please. They even keep themselves out on the line in the air, and catch with their poles numbers of birds flying out and into their holes. The greatest art consists in throwing themselves out, so as to swing under the projection of a rock, where the birds gather together: here they fix their feet, loosen themselves from the rope, and fasten it to a stone, to prevent its swinging out of their reach. When a man has done this, he climbs about and catches the birds either with his hands or his pole, and when he has killed as many as he thinks proper, he ties them together, fastens them to the small line, and by a pull gives a sign for those above to draw them up. In this manner he works all day, and when he wants to go up, he either gives a signal to be drawn up, or, with his belt full of birds, works himself up with his hands and feet.

In case there are not people enough to hold the rope, the birdman fixes a post in the ground, fastens his rope to it, and slides down without any help. After which he goes to work as before. In some places there are steep cliffs of a prodigious size lying under the land, and yet above two hundred yards above the water, which are likewise very difficult to be got at. Down these cliffs they help one another in the above manner, and taking a strong rope with them, fasten it here and there in the cliff where they can, and leave it all the summer: upon this they will run up and down, and take the birds at pleasure.

It is impossible to describe how dreadful and dangerous this bird-catching appears to the beholders, from the vast height and excessive steepness of the rocks, many of which hang over the sea. It seems impossible for men to enter the holes under these projections, or to walk a hundred fathoms high on crags of rocks, where they can but just fix their toes.

After the birds are brought home, they eat part of them fresh, and part is hung up to dry for the winter season. These birds afford the inhabitants a good maintenance, partly from their feathers, which are gathered and sent to foreign parts, and partly from their flesh and eggs; some sorts of which are as good as hens eggs, and are sent to market, though they are of various colours and sizes.

S E C T. V.

Of the Religion and Government of the Norwegians.

LUTHERANISM is the established and almost the only religion in Norway, except in the province of Finmark, where are still no inconsiderable number of pagans, but no hardship, expence, or labour is spared for their conversion. The first measures for the reformation of religion in Norway, were taken in the year 1528, and were completed in 1537. In 1607 a new hierarchy, or church government, was established: in every see there is a bishop: the bishop of Christiana is the principal, and takes place of all the rest. Under the bishops are the provosts, the preachers, and the chaplains, or curates, with inferior church officers. A parish usually contains more churches than one; whence the parochial incumbent has often the care of many.

With respect to the laws of Norway, king Olave is said to have been the first legislator of this country, and to have instituted a law for the punishment of rob-

bery, fraud, and assaults. King Christian IV. published a new body of laws for Norway, which were in force till the reign of Christian V. who caused a new digest to be drawn up, and these are the only laws now observed in the kingdom. This law-book was printed in one volume in quarto at Copenhagen in 1687; the substance of it is taken from that of Denmark, with only a few alterations made necessary by the different circumstances of the two kingdoms.

At present the chief officer in Norway is a vice-stadtholder, who is president of the supreme court of judicature at Christiana, which is the general tribunal for all Norway, to which there lies an appeal in all causes from the inferior courts of the several dioceses, or general governments, in this kingdom; but may, however, be removed to the supreme court at Copenhagen.

Each of the four dioceses, or general governments, into which Norway is divided, has its general governor, and under these are the prefects. The office of both is the same as in Denmark.

Next to the prefects are the secretaries, and the collectors, who levy the king's taxes, and pay them into the hands of the receiver.

Over the nine provincial courts are nine judges: there are also inferior judges, each of whom, in conjunction with eight assistants, has the power of deciding causes within his district. Besides, in the four chief cities of Norway, Christiana, Christiansand, Bergen, and Drontheim, are presidents appointed by the king; and under these, as in all other towns, are collectors. There are likewise collectors of the toll, comptrollers over the farmers of the duties, and commissaries of provisions in this part of his Danish majesty's dominions.

With respect to the divisions of Norway, nature has divided the main land of this kingdom into two parts by the immense chain of mountains called Dofrefield and Langfield, which separate the western and northern parts that lie near the sea, from the southern and eastern, or inland parts. Here it must be observed, that the high lands which lie to the south and east of these mountains are called Sondenfield, or South-land; while that lying north of Dofrefield and west of Langfield towards the sea, is called Nordenfields, or North-land.

But, according to the political division of this country, it consists of four general governments; two of which, that is Christiana and Christiansand, lie in the south; and Bergen and Drontheim in the north part of the kingdom. The ecclesiastical division into four bishoprics, is agreeable to the civil, and as the general governments are subdivided into prefectures, and districts or fiefs, so the bishoprics are subdivided into provostships and parishes.

S E C T. VI.

Of the four Governments of Norway, and the principal Places in each; particularly of the Silver-Mines of Kongsberg.

THE government of Christiana, or Aggerhuus, is the largest in the south part of the kingdom, and the richest in all Norway. Its principal city is Christiana, which is said to be the most magnificent city in the kingdom; it is regularly built, is of considerable extent, and carries on a great trade. Here the governor and the bishop of Christiana resides, and here are held the general and provincial high courts of judicature. It has a work-house, and two suburbs called Waterland and Peper-Vigen; through the first runs a river, which rises in Maridalen. We have, however, no particular description of the buildings of this city, which is situated in fifty-nine degrees fifty minutes north latitude, and in ten degrees fifteen minutes east longitude.

Kongsberg is a flourishing mine town in this government, that contains no less than ten or eleven thousand souls, among whom are a congregation of Danes and another of Germans. A mint was set up in this town so early as the year 1686, and in 1689 the mine college was erected. Kongsberg is most famous for its silver mines, which are the richest in all Norway. These were dis-

discovered in 1623, upon which the town was immediately built, and peopled with German miners. In 1751, forty-one shafts and twelve veins were wrought in the four reviers of this mine, in which three thousand five hundred officers, artificers, and labourers are usually employed. The rich ore in this mine is found only in dispersed stratas and interrupted veins. Even pure silver is sometimes dug out of it; and in 1647 some gold was found among the silver, of which king Christian IV. caused the famous Brillen ducats to be coined, with this legend, *VIDE MIRA DOMINI*; See the wonderful works of the Lord. In the year 1697, a vein of gold was discovered here, of which ducats were coined, which on one side had this inscription, *CHRISTIAN V. D. G. REX DAN. NORW. V. G.* The legend on the reverse was from the book of Job: *VON MITTERNACHT KOMMT GOLD*: that is, Out of the north cometh gold. Kongsberg, December 1, 1697.

These mines are in a mountain between Kongsberg and the river Jordal: but it has been found that the silver ore is not, as was at first imagined, limited to that mountain, but extends its veins for some miles, throughout the adjacent districts; which is proved by the new mines that are from time to time undertaken in several places, and most of them carried on very prosperously. One of the most ancient and rich of all the mines, named Old God's Blessing, has sometimes within a week yielded several hundred pounds weight of rich ore. This mine never fails to fill the beholder with amazement at its astonishing depth, which is no less than an hundred and eighty perpendicular fathoms; and the circumference at the bottom forms a clear of some hundreds of fathoms. Here the sight of thirty or forty piles, burning on all sides in this gloomy cavern, and continually fed, in order to mollify the stone in the prosecution of the mines, seems, according to the common idea, an image of hell; and the swarms of miners, covered with soot, and bustling about in habits according to their several employments, may well pass for so many devils; especially when, as a signal that a mine is going to be sprung in this or that course, they roar aloud, *Berg-livet! Berg-livet! Take care of your lives!*

Frederickshall is a famous frontier town towards Sweden, situated in latitude fifty-five degrees, twenty-six minutes, at the mouth of the river Tistedal, where it discharges itself into the Spinesund. This town was formerly called Halden, and was a mean place, under the jurisdiction of the magistracy of Frederickstadt; yet it made a very gallant defence against the Swedes in 1658 and 1659, by means of a small intrenchment or rampart. It was afterwards strengthened with additional fortifications; and in 1660 sustained a third siege from the Swedes; and Charles Gustavus is by some thought to have received here the wound of which he died. Five years after, this town received a charter with the privileges of a city. In 1716 and 1718, the inhabitants again distinguished themselves by the vigorous defence they made against the attacks of the Swedes; and here, on the eleventh of December 1718, Charles XII. of Sweden was shot in the trenches. King Frederic IV. ordered a pyramid twenty feet high to be erected on the spot where that hero fell. Its sides were decorated with military trophies, the arms of Sweden, and the king's name; and the top was surmounted with a gilt crown. On four marble tables at the base, were one Latin, and two Danish inscriptions in golden letters. But king Christian VI. in compliment to Sweden, ordered this pyramid to be taken down. The town itself is of no great strength; but on a high rock opposite to it, stands the strong fortress of Frederickstein, and there are other smaller forts near it. This city has been several times destroyed by fire.

Frederickstadt was built in 1567 by Frederic II. who granted it a favourable charter, and removed the provincial court thither. It lies thirty-four miles to the south of Frederickshall, and is governed by a town magistrate, and its chief trade is in timber. Frederickstadt was regularly fortified in 1655 by Frederick III. and new works have been since added to it; so that its strength by nature and art, and its convenient situation, render it the most important fortress in Norway.

The general government of Christianland is situated in the most southern extremity of Norway, and is bounded on the north by the government of Christiana, and on the east, south, and west by the North Sea. This province is fertile in corn, and has several rivers, one of which is the Mandel, which in one place has a bridge laid over it from one rock to another, thirty-six feet above the surface of the water. At a small distance from this bridge is a cataract, where a very uncommon method of fishing is practised; the fishermen go under the cataract, which forms an arch over their heads, to catch the salmon, at the extreme hazard of their lives, in a hole in the rock. This government consists of four prefectures, five districts, and has two provincial courts.

The principal city of this government is Christianland, which is situated on the eastern coast, in the fifty-ninth degree three minutes north latitude, and is the residence of the bishop and the general governor, where is a cathedral and episcopal school. This city was built by Christian IV. between the year 1641 and 1643, and is thus called from its founder, and the great sande, or strand, on which it is built. It is of a square form, and the streets are broad, regular, and handsome. Its situation is very commodious, three sides of it being surrounded either with fresh or salt water, and on the fourth it has a communication with fine meadows and the mountains. In 1734 the church, with the greatest part of the city, was destroyed by fire.

The small town of Arndal is remarkable for its situation on a rock in the midst of the river Nid. It has a good wharf, and most of the houses stand on the acclivity of the rock, the rest being built on piles in the water. The streets are only formed of bridges of boats, by means of which the inhabitants go from house to house. The water is of sufficient depth for the largest ships to lie alongside of the bridges. As the church stands high, and almost on the summit of the rock, there is an ascent to it from the houses by a great number of steps hewn out of the rock. The inhabitants make a good use of the commodious situation of this town for trade, by employing many ships and dealing largely in timber.

The government of Bergen is from two hundred and forty to three hundred miles in length, and contains only the single prefecture of Bergenhuus, including seven districts, and the same number of provostships. This country is very populous, and is remarkable for its having seven marble quarries; but produces little corn.

The only city we shall describe in this government is that of Bergen, its capital, which has the greatest trade in all Norway. It is situated in the sixty-first degree eleven minutes north latitude, in the midst of a valley, and built in a semicircular form, on the sides of a bay called by the inhabitants Waag. It is so well fortified by nature on the land side by lofty mountains, seven of which are remarkably high, while the defiles or passes between them are quite impracticable to an enemy, and towards the sea the harbour is well defended by several fortifications. All the churches, public edifices, and most of the houses along the strand are built with stone. This city formerly contained thirty churches and convents; but it has at present only four parish churches, three of which are Danish, and one German, with a church in the large hospital of St. Jorgen, and a small chapel in St. James's church-yard. The castle of Bergen is a noble structure. The large cathedral school was founded in 1554, by bishop Petrus, who also endowed it, and, by the liberality of king Frederic II. and others, twelve scholars are maintained and educated in it. The navigation school founded here, which once flourished greatly, is now fallen to decay. The seminary Fredericianum also deserves notice, it being a noble foundation, where moral and natural philosophy, the mathematics, history, with the Latin and French languages, are taught. This city carries on a large trade in all kinds of fish, tallow, hides, and timber; and the returns are mostly made in corn and foreign commodities. The number of its inhabitants are computed at thirty thousand.

The general government of Drontheim is the most northern province in Norway, and the largest in extent. It borders on the North Sea, on Sweden, and Swedish Lapland.

A New & Accurate

from the Sieur Roberts
ATLAS,
with Improvements.

British Statute Miles.

J. Wilson Sculp.

Longitude East 12 from London

Lapland. A range of islands extends from north-east to south-west, and between them and the continent runs a large bay called West Fiorden. Among the above islands is a remarkable kind of current, or whirlpool, called the Moskoeftrom, in the sixty-eighth degree of latitude, near the island of Moskoe, from which this whirlpool takes its name. Its violence or roarings exceed those of a cataract, being heard at a great distance, without any intermission, except for a quarter of an hour at the turn of high and low water, when its impetuosity seems at a stand, and fishermen venture in: but this motion soon returns, and let the sea be ever so calm, gradually increases with such a draught and vortex, as absorb whatever comes within their sphere of action, keeping it for some hours under water, when the fragments, shivered by the rocks, appear again. This circumstance, among others, makes several authors firmly believe, that here is an abyss penetrating the globe, and issuing in some very remote parts; and Kircher is so particular as to assign the gulph of Bothnia. But the learned bishop of Pontoppidan observes, that, after the most exact researches, this is but a conjecture without any foundation; it having no other cause than the collision of the waves rising and falling at the flux and reflux, against a ridge of rocks and shelves, which confine the water, so that it precipitates like a cataract; and thus the higher the flood rises, the deeper must be the fall, the natural result of which is a whirlpool.

Mr. Ramus is of the same opinion, and observes, that at the time of flood the stream runs up the country between the islands of Lofoden and Moskoe, with a boisterous rapidity; but the roar of its impetuous ebb to the sea is scarce equalled by the loudest and most dreadful cataracts, the noise being heard at several leagues distance. The whirlpool is then of such extent and depth, that if a ship comes within its attraction, it is inevitably absorbed, and dashed to pieces against the rocks at the bottom. But when the stream is most boisterous, and its fury heightened by a storm, it is dangerous to come within one Norway, or six English miles of it, boats,

ships, and yachts, having been carried away, by not guarding against it, before they were within its reach. It frequently happens that even whales coming too near the stream, are over-powered by its violence; and then it is impossible to describe their howlings and bellowings in their fruitless struggles to disengage themselves. A bear once attempting to swim to the island of Moskoe, in order to prey on the sheep at pasture in the island, afforded the like spectacle to the people; for the stream caught him and bore him down, while he roared terribly so as to be heard on shore. Even large firs and pine-trees, after being absorbed by the current, rise again, with their trunks broken and torn to such a degree, that they seem as if covered with bristles.

The general government of Drontheim contains three prefectures, which are those of Drontheim, Nordland, and Finmark.

The principal city in this province is that of Drontheim, which is in the prefect of the same name. It is two hundred and sixty-one miles north-east of Bergen, in the sixty-third degree sixteen minutes north latitude, and in the tenth degree fifty-five minutes east longitude from London. It is situated on the river Nid, which almost surrounds it, and had formerly ten churches and five convents, but at present it has only two churches besides that at the hospital. The cathedral, which was a superb edifice built with marble, was all burnt down in 1530, except the choir, which is rather too large for the present church, and is still called the cathedral. This city is the residence of the general governor and the bishop. It has a fine cathedral school, a seminary of missionaries, an orphan house, a work-house, a house of correction, and an hospital. A considerable trade in timber, fish, tallow, and copper, is carried on in this city; which is defended by fort Christianstein, erected in 1680; it has also some fortifications on the land-side; and the castle of Munkholmen, which stands on a rock in the harbour of Drontheim, and defends both the city and harbour towards the sea.

C H A P. VII.

Of D E N M A R K.

S E C T. I.

The Islands and Country included under that Name. Their Situation, Climate, and Produce in general.

DENMARK, properly so called, consists of two pretty large, and several small islands, together with the peninsula of Jutland. It is remarkable that though all these together constitute the kingdom of Denmark, not any one of these is separately called by that name.

Denmark is situated exactly to the north of Germany, and is separated from it by the Baltic, and by the Leven and the Eider, which divide Jutland from Germany; to the west, it is washed by the North-Sea; to the north, it has the Categate; and to the east, is bounded by the Baltic. Between the continent and the islands, Funen and Zealand are the famous freights, called the Sound, which divides Denmark, or, in other words, the island of Zealand, from Sweden. The Sound is about a thousand three hundred and thirty-one fathoms broad, and is the common passage out of the North-Sea into the Baltic. This, with the other freights, called the Great-Belt and the Little-Belt, are reckoned part of the king of Denmark's dominions, and all ships that pass that way are obliged to pay a toll, according to the value of the cargoes with which they are laden.

Besides the places just mentioned as constituting the kingdom of Denmark, there are many others subject to

that state, particularly the kingdom of Norway, just described, with the islands Faroe, Iceland, and part of Greenland, half of the dutchy of Holstein, with the counties of Oldenburg and Delmenhorst in Germany; the citadel of Christiansburg on the coast of Guinea; the islands of St. Thomas and St. John, with some of the Caribbee islands, and St. Croix in America; the town of Tranquebar, with its territory, and the islands of Nicobar on the coast of Coromandel, in the East-Indies. We are here to consider only what is properly termed Denmark.

It is difficult to determine the extent of the whole kingdom of Denmark, with any tolerable degree of exactness, because its parts are not contiguous to each other; but we shall hereafter give the extent of every part singly.

The air in North Jutland is pretty cold and piercing; but on the east side of South Jutland, and in the islands of Funen and Zealand, it is milder and more temperate: however, in the low and marshy part, and in the island of Laaland, the air is thick, moist, and unhealthy. The shifting of the winds, indeed, while it renders the weather somewhat variable, at the same time purges the air of fogs and vapours. The west wind, which frequently blows in these parts, is the most violent.

Denmark lies mostly low and on a level, and, except the tract of land about the middle of Jutland, is very fertile; so that the country maintains the inhabitants in plenty, and yields every thing necessary for the support of human life: but the inhabitants can better dis-

pense with their horned cattle and horses for exportation, than with their corn. The sea coasts, lakes, ponds, rivers, and brooks of this country yield abundance of fish. Denmark produces no wine, no metals, and very little salt. Most of the provinces have wood sufficient for their necessary occasions; but as this is not the case with them all, the Danes are obliged to burn a great deal of turf.

We shall give a more particular account of the produce of this kingdom in treating of its several parts, and shall now proceed to the inhabitants, their manners, customs, and government.

SECT. II.

The Persons, Dress, Manners, and Customs of the Danes.

THE Danes are generally tall and strong limbed; they have good features, and an agreeable complexion; their hair is fair, and for the most part yellow or red; and, as few of them wear wigs, they take a great deal of pains in combing and curling their locks. As red hair is natural to the country, they have not the folly to be ashamed of it, and therefore do not endeavour to conceal or change the colour. Both the gentlemen and ladies in summer dress very splendidly after the French mode; but in winter, like the rest of the northern people, they wrap themselves up in furs or wool. The winter dress of the ladies, which is Danish, is very convenient and becoming. The burghers, the servants, and even the peasants, are neat in their linen, which they often change, and all who can afford it are fond of making a splendid appearance.

The lord Molesworth says, that he never knew a country where the minds of the people are more upon a level; and that as there are none of extraordinary qualifications to be found, who excel in particular arts or sciences, so there are seen no enthusiasts, madmen, natural fools, or whimsical people; but a certain equality of understanding reigning among them, every one plods on in the ordinary beaten track of common sense, without deviating to the right or left. The people in general, however, read and write, and their clergy usually talk Latin. We cannot say how far this nobleman was prejudiced in the account he has given of these people; but the encouragement given to learning, and the modern improvements that have been made in Denmark, by the introduction of the arts and sciences, has rendered his picture extremely unlike the original.

We are informed by that nobleman, that the vices which the gentry are most addicted to are gluttony and drunkenness. When they sit down to eat and drink, says he, they never know when to rise; but the debauch sometimes continues whole days and nights. The first thing a friend is presented with at his entering the house, is a dram of brandy; and they no sooner sit down to dinner, but all the men and women have a glass set by their plates; and, on proposing a health, all take off their glasses together, and by that means make quick dispatch: the women indeed, he says, retire soon after dinner; but the men sit till they have lost that little sense which falls to their share. But after all, there is nothing more unjust than these national reflections, which have frequently no other foundation than that circle of acquaintance which a stranger happens to fall into while he resides in a country; and indeed where they are just at one time they are far from being so in another; for customs like these differ greatly within the compass of an age.

The liquor drank by people of rank are chiefly rhenish wine, cherry brandy, and all sorts of French wine; while the common people drink beer and malt spirits. The tables of the great are covered with a variety of dishes. They have no fallow deer, woodcocks, pheasants, or rabbits; and red deer being the king's game, are not to be purchased: their beef and veal are excellent, as are also their bacon and hares. The common people, whether in town or country, generally live upon coarse rye bread, lean salt meat, stock-fish, roots, and bad cheese, seldom tasting of flesh-meat, except on some ex-

traordinary festivals, as on St. Martin's eve, when each family in Denmark never fails to make merry, and to have a roasted goose for supper. As to the peasants, they chiefly live on roots, greens, white meats, and rye bread. Sea fish is scarce, and not very good; but the river fish make amends, here being most excellent perch, carp, and craw-fish. One cannot expect very extraordinary fruit so far to the north; yet the gentry do not want such as are very tolerable; and some of the nobility have grapes, melons, peaches, and all sorts of fallads very early, and in great perfection.

It is said to be difficult for strangers to find the conveniences of lodging and boarding in Denmark; for even in Copenhagen there are few lodgings to be let in private houses, and in the taverns people must be content to eat and drink in a public room, into which any other company may enter.

With respect to their marriages, they are sometimes contracted three, four, or more years before the ceremony is performed. The gentry give portions with their daughters; but the burghers and peasants only give cloaths, household goods, and a great wedding dinner, which are all they part with till their death.

Magnificent burials and monuments are usual with the nobility, and sometimes the body of a person of quality is kept in a vault, or the chancel of a church, for several years together, till they have an opportunity of celebrating the funeral with sufficient splendor. The poorer sort are buried in great thick chests, and in the towns there are about a dozen common mourners belonging to each parish, who are obliged to carry and attend the people to their graves.

SECT. III.

Of the Language of the Danes; their Skill in the Arts and Sciences; the Manufactures carried on in the Country; their Commerce and trading Companies; with their Coins, Weights, and Measures.

THE Danish language is only a dialect of the Swedish and Norwegian; whence the inhabitants of these three nations in general understand each other, except in a few words and phrases. The modern Danish is a mixture of the antient Gothic, Frisian, and German languages; and, with respect to the pronunciation, has some affinity with the English, with which it has many words in common.

The number of learned men in Denmark is said to be now as considerable as in any other country in Europe of its extent, for there is scarce any branch of literature in which the men of genius of this kingdom have not acquitted themselves with honour. Besides the university at Copenhagen, which consists of four colleges, the academy at Soroe, and the seminary at Odense, there are several schools well endowed in country towns, where the masters are not only liberally provided for, but the scholars are instructed and partly maintained gratis. In 1742 a royal academy of sciences was instituted at Copenhagen, with a royal society for the improvement of the northern history and languages. Societies for the improvement of the useful arts and manufactures, and of the several branches of natural philosophy, have been instituted; and in 1736 the Theatrum Antomico-Chirurgicum and several libraries were erected. At Copenhagen is also an academy for painting, sculpture, and architecture; and there the polite arts are in high esteem.

Scarce any manufactures were carried on in Denmark in the last century; for they were first introduced by Frederick IV. and Christian VI. There are at present artists of extraordinary skill at Copenhagen, and every branch of the mechanic arts is well executed in Denmark. Silks, stuffs, and velvets; cloth, cottons, and woollen stuffs; gold and silver lace, tapestry, stockings, and hats; with different sorts of hardware, are also made in this kingdom: as are likewise porcelain and fire-arms. Here are besides paper and copper mills, one silk and two cotton printing-houses; with manufactories of soap, starch, steel, glue, sugar, tobacco, and lacquer. The lace of Tondern, and the gloves of Odense and Randers, are allowed to be excellent in their kind. Indeed no manufactures

factures are now permitted to be imported into Denmark; and, since the year 1736, the wearing of jewels, gold and silver stuffs, and foreign lace, has been also prohibited. In 1738 a general warehouse, or magazine, was opened at the exchange, in Copenhagen, to which manufacturers bring all the wares they cannot dispose of in other towns, and are paid ready money for them; and from this warehouse the goods are delivered out to the retail traders on credit.

Indeed as Denmark enjoys the most commodious situation for navigation and commerce, it might be made the center of the important trade of the North, and particularly that carried on in the Baltic.

All the commerce of this kingdom was formerly carried on by the Hanse-towns; but they were afterwards supplanted by the English and Dutch, but chiefly by the latter. The Danes first began to carry on their own trade in the reign of Christian III. it was encouraged by Christian IV. and in the reign of Christian V. was carried on in their own bottoms; but Frederick IV. may be called the real founder of the Danish commerce, which was supported by Christian VI. and Frederick V, by his munificence, endeavoured to carry it to its highest pitch. The strict application of the Danes to navigation and commerce partly appears from the several opulent companies established at Copenhagen.

The principal of these is the royal Asiatic company, first erected in 1616, and confirmed by a royal charter in 1698, which was renewed with proper regulations in 1732 and 1744. This company trades to Tranquebar on the coast of Coromandel, where they have a governor, and to Canton in China. They carry on this commerce almost entirely with current specie, or bullion; and in return bring chintz, cottons of all sorts, muslins, pepper, tea, salt petre, &c. For these commodities they receive considerable sums of money from foreigners, who take them off their hands, and by this means refund the specie carried out of Denmark. They also supply their own country with all these merchandizes. This company sends two ships annually to Canton, which return richly laden, and two or three more to Tranquebar.

The West India and Guinea company, which was formerly established by charter, was dissolved in 1754, and the trade to America laid open to the natives of Denmark, Norway, and Sleswic; but in 1755 the king established an African company, with a capital of five hundred actions, every action consisting of five hundred rixdollars, which are divided between thirteen adventurers.

There is also established by a royal charter a general trading company, instituted in order to carry on such branches of trade as no private adventurers are able to undertake; and at the same time to serve as a kind of academy for young merchants. This company was incorporated in 1747, and enjoys considerable privileges. Its actions are one thousand, each of which consists of five hundred rixdollars, but only three hundred are paid down; so that their fund amounts to no more than three hundred thousand rixdollars: but the remaining two hundred of every action may be demanded on any emergency. This company carries on a trade to France, Spain, the Mediterranean, the Baltic, and likewise to Greenland, by sending ships to the whale fishery.

The Iceland and Finmark company, who obtained their last charter in 1746, have monopolized the trade to Iceland and Finmark; but that charter is to expire in 1771.

Besides, other Danish adventurers, trade to different ports of Europe; but the imports in Denmark always exceed the exports: however, it is quite the reverse in the kingdom of Norway.

The Assignment-Exchange, or Loan-Bank, was erected at Copenhagen in 1736. The bank-notes are drawn for a hundred, fifty, or ten rixdollars, and pass through all the king's dominions, and the public offices, as current specie. Great and small sums, not under a hundred rixdollars, are lent out of this bank at four per cent. on depositing a sufficient pledge. The capital stock is no more than five hundred thousand rixdollars, and though their circulating notes amount to much more, they are in very good credit.

There is also an office of insurance for ships at sea, established by charter. The number of ships that annually enter the port of Copenhagen is very considerable; for it appears that above three thousand ships and smaller vessels, laden with all sorts of merchandize, especially timber, materials for building, and provisions, were entered at the custom-house in the year 1752.

The current coins in Denmark are, a rose-noble, which is eighteen shillings sterling; a ducat, nine shillings; a rixdollar, four shillings and sixpence; a slet-dollar, three shillings; a rix-mark, about eleven-pence; a slet-mark, about nine-pence; and a stiver, a penny; besides these there are several copper coins of small value.

The weights are the great and small hundred, the first a hundred and twenty pounds, and the other a hundred and twelve pounds; they have also their lispound, which is as much as our stone of fourteen pounds; and their shippound, which is twenty lispounds. A Danish ell is about one-third less than the English; and a Danish mile almost six English miles.

S E C T. IV.

Of the Religion and ecclesiastical Jurisdiction of Denmark.

THE Danes, in antient times, paid religious worship chiefly to the gods Fryer, Thor, Thyr, Odin, and Freya, and in the Danish language four days in the week still retain the names of the four last imaginary deities; of which Odin was the chief. Several attempts were made at different times, in the middle ages, to convert the Danes to Christianity, and in 882, Ebbo, bishop of Rheims, preached the gospel in Denmark. King Harald Klag, who fled for refuge to the emperor Lewis, consenting to be baptized, was attended back to his kingdom by several monks, who founded churches in many places in Denmark, particularly at Haddebye, in the dutchy of Sleswic, where the first Danish church was erected. But the succeeding kings were the inveterate enemies of the Christians, and cruelly persecuted the new converts; however, after various vicissitudes of fortune, they at length obtained a free and uninterrupted toleration from king Sweno, about the year 1000.

At length, when Luther began to restore the doctrines of the gospel to their genuine purity, they were favourably received in Denmark by Christian II. The reformation gained still more ground under Frederic I. and at the diet held at Copenhagen in 1537, was made the established religion; when John Bugenhagen drew up a new body of ecclesiastical laws, and made several other good regulations.

Though the Lutheran religion is established in this country, other religious sects, as the Calvinists, the Jews, and the Papists, enjoy the free exercise of their religion in Copenhagen, Fredericia, and Fredericstادت. The Arminians, Mennonites, and Quakers, are also tolerated at Fredericstادت; and on the island of Nordstrand, the Roman-catholics enjoy the public exercise of their religion. By the laudable endeavours of the kings of Denmark, the light of the gospel also shines in Finmark, Greenland, and among the inhabitants of Malabar, on the coast of India; and in 1714, a society for the propagation of the gospel was instituted for that purpose.

The chief ecclesiastical jurisdiction is under the bishops, of which there are six in Denmark, four in Norway, and two in Iceland. Of these the bishop of Zealand and Christiana have the precedence. The former is also third professor of divinity in the university of Copenhagen, and consequently is obliged to reside in that city. The title of archbishop is abolished in Denmark; and both Sleswic and Holstein are under a general superintendent.

The power of the bishops was formerly very considerable in Denmark; for, with the other principal prelates, they formed the third state of the kingdom; but at present they enjoy no other power, but what the general superintendants in Germany are invested with. They are always appointed by the king, and are obliged, every three years, to visit the churches and schools in their res-

respective dioceses; to examine and ordain new preachers; and, together with their provosts, to hold, at stated times, provincial synods, where they preside in conjunction with the governor of the province. Their revenue arises from lands, tythes, and what is called the cathedralicum, or a small sum which they receive from every church in the diocese. In every cathedral is a small college, which consists of four or five canons, who meet twice a year in the chapter-house, in order to sit as judges in matrimonial and other causes, which were formerly decided by the canon law. There was formerly a divinity lecturer, who read public lectures weekly in every cathedral; but these have been laid aside.

Next to the bishops are the provosts, of which there are a hundred and sixty in the whole kingdom, who annually visit the preachers and schoolmasters within their jurisdiction; decide disputes between the preachers and the vestries, or parishes, when they are cognizable by the ecclesiastical law; and twice a year appear at the provincial synod. The provosts have annually a rixdollar, or four shillings and sixpence sterling, from every church in their jurisdiction, and in their visitations are entertained gratis.

Next to these are the preachers, whose assistants are called chaplains. The revenues of the Danish clergy, which arise partly from tythes and partly from the liberality of their respective flocks, are very considerable. Confession money is indeed abolished; but instead of it, the preachers enjoy the offerings made by their congregations at Christmas, Easter, and Whitsuntide. A preacher's widow in Denmark receives half the benefit of the first year, and the eighth part of the income every year after, from the successor of her deceased husband. In the principal town of every diocese is also a widow's box, in which every preacher puts a certain sum, and if his widow survives him, she enjoys an annuity in proportion to what he has contributed.

SECT. V.

A particular Account of the Manner in which the Danes made a voluntary Surrender of their Liberties; with the Privileges enjoyed at present by the Nobility, the Burghers, and the Peasants.

IT will be proper here to give an account of an event which will always be esteemed one of the most extraordinary that has ever been mentioned in history. Till about the middle of the last century, Denmark was governed by a king chosen by the people of all ranks, who in their choice, paid a due regard to the family of the preceding prince, and if they found one of his line properly qualified to enjoy that high honour, they thought it just to prefer him before any other, and were pleased when they had reason to choose the eldest son of their former sovereign: but if those of the royal family were either deficient in abilities, or had rendered themselves unworthy by their vices, they chose some other person, and sometimes raised a private man to that high dignity.

One of the most fundamental parts of the constitution was the frequent meetings of the states, in order to regulate every thing relating to the government. In these meetings new laws were enacted, and all affairs relating to peace and war, the disposal of great offices, and contracts of marriage for the royal family, were debated. The imposing of taxes was merely accidental, no money being levied on the people, except to maintain what was esteemed a necessary war, with the advice and consent of the nation, or now and then by way of free-gift, to add to a daughter's portion. The king's ordinary revenue consisted only in the rents of lands and demesnes, in his herds of cattle, his forests, services of tenants in cultivating his ground, &c. for customs of merchandize were not then known in that part of the world: so that he lived like one of our modern noblemen, upon the revenues of his estate. It was his business to see justice impartially administered; to watch over the welfare of his people, to command their armies in person; to encourage industry, arts, and learning; and it was equally his duty and interest to keep fair with the nobility and

gentry, and to be careful of the plenty and prosperity of the commons.

But in 1660, the three states, that is, the nobility, clergy, and commonalty being assembled, in order to pay and disband the troops which had been employed against the Swedes, the nobility endeavoured to lay the whole burden on the commons; while the latter, who had defended their country, their prince, and the nobility themselves with the utmost bravery, insisted that the nobles, who enjoyed all the lands, should at least pay their share of the taxes, since they had suffered less in the common calamity, and done less to prevent its progress.

At this the nobility were enraged, and many bitter replies passed on both sides. At length the principal senator standing up, told the president of the city, that the commons neither understood the privileges of the nobility, nor considered that they themselves were no better than slaves. The word slaves was followed by a loud murmur from the clergy and burghers: when Nanson, the president of the city of Copenhagen, and speaker of the house of commons, observing the general indignation it occasioned, instantly arose, and swearing that the commons were no slaves, which the nobility should find to their cost, walked out, and was followed by the clergy and burghers, who proceeding to the brewers-hall, debated there on the most effectual means of humbling the insupportable pride of the nobility.

The commons and clergy the next morning marched in great order to the council-house, where the nobles were assembled; and there the president Nanson, in a short speech, observed, that they had considered the state of the nation, and found that the only way to remedy the disorders of the state was to add to the power of the king, and render his crown hereditary; in which, if the nobles thought fit to concur, they were ready to accompany them to his majesty, whom they had informed of their resolution, and who expected them in the hall of his palace.

The nobles, filled with a general consternation at the suddenness of this proposal, and at the resolution with which it was made, now endeavoured to sooth the commons by fair speeches; and urged, that so important an affair should be managed with due solemnity, and regulated in such a manner as not to have the appearance of a tumult.

To this the president replied, that they only wanted to gain time, in order to frustrate the intentions of the commons; who came not thither to consult, but to act. After farther debate, the commons growing impatient, the clergy, with the bishops at their head, and the burghers headed by their president, proceeded, without the nobles, to the palace; and were met by the prime minister, who conducted them to the hall of audience, whither the king soon came to them.

The bishop now made a long speech in praise of his majesty, and concluded with offering him an hereditary and absolute dominion. The king returned them thanks; but observed, that the concurrence of the nobles was necessary: he assured them of his protection, and promised to ease their grievances.

The nobles were all this while in the greatest distraction; they could come to no resolution, and broke up in order to attend the funeral of a principal senator: but while they were at a magnificent dinner, which was usually provided on such occasions, they were told that the city gates were shut by the king's orders, and the keys carried to court. They were now filled with the apprehensions of being all massacred, and the dread of losing their lives took away all thoughts of their liberty: they therefore immediately dispatched messengers both to the court and to the commons, to give notice of their compliance. But the king, being resolved to pursue the affair to the utmost, would not suffer the gates to be opened till the whole ceremony of the inauguration was concluded. Three days were employed in preparing for the fatal hour, in which they were to make a formal surrender of their liberty. Scaffolds covered with tapestry were erected in the square before the castle, and orders were given for the burghers and the soldiers to appear in arms, under their respective officers. In short, on the

seventh of October, in the morning, the king, queen, and royal family being mounted on the theatre erected for that purpose, and seated in chairs of state under velvet canopies, received publicly the homage of all the senators, nobility, clergy, and commons, which were performed on their knees, each taking an oath to promote his majesty's interest in all things, and to serve him faithfully as became hereditary subjects. One Gersdorf, a principal senator, was the only person who had the courage to open his lips in behalf of their expiring liberties, and said, that he hoped and trusted that his majesty designed nothing but the good of his people, and not to govern them after the Turkish manner; but wished his successors would follow the example his majesty would undoubtedly set them, and make use of this unlimited power for the good, and not for the prejudice of his subjects. None of the rest spoke a word, or seemed in the least to murmur at what was done. Those who had payed their homage retired to the council-house, where the nobility being called over by name, and ordered to subscribe the oath they had taken, they instantly obeyed.

Thus in four days time the kingdom of Denmark was changed from a state but little different from that of an aristocracy, to that of an unlimited monarchy. We here see a house of commons stimulated by resentment, and filled with indignation at the insolence of the nobility, betraying their constituents, and instead of a noble effort to oblige those nobles to allow them the privileges they had a right to demand, voluntarily giving up for themselves, their constituents, and their posterity, what they ought to have struggled to preserve at the hazard of their lives, and of whatever else might have been esteemed valuable; while the only comfort the people had left, was to see their former oppressors almost as much humbled as themselves. The clergy indeed reaped many advantages from this change; but the citizens of Copenhagen obtained little more in exchange for their liberty, than the insignificant privilege of wearing swords.

The nobles of Denmark are distinguished by the appellation of the higher and lower nobility. There never were any dukes in Denmark, besides the king's sons, except one nobleman named Knut Pors, who was created duke of Halland by Christopher II. so that the rank of higher nobles includes only counts and barons. The counts enjoy certain privileges, and their younger sons and daughters are not only stiled barons and baronesses, but enjoy the privileges annexed to that rank. In their counties they have the right of patronage, and of appointing a judge and secretary, from whose sentence there lies no appeal, but only to the supreme court of judicature. They are allowed three hundred acres of land free from all impositions: they bear a coronet over their coat of arms; and all suits carried on against them must commence in the supreme court of judicature.

The rights and privileges of the barons is much the same with those of the counts. The principal difference is, that the barons enjoy only one hundred acres of land free from tythes and contributions, and are something inferior to the counts in rank and title.

The privileges of the lower nobility, like those of the former, consist in their being cited only before the king's supreme court, in all affairs that affect their life and honour, except they have a post in the militia by land or by sea, in which case this privilege extends only to the superior officers. No inferior judge can execute a sentence passed upon them, for that must be done only by the judge or his commissary.

A lord of a manor who, besides the produce of his manor, together with the mills and tythes, has two hundred acres of land in farm estate lying within two miles of his manor, is free from contribution. Lords of a manor have also the privilege of appointing a judge and secretary; that of hunting and fishing; the right of trover, if the proprietor of the goods found does not make his claim within a year and six weeks; and the right of patronage or presentation to their own churches. These are the principal privileges enjoyed by the nobility since the kings of Denmark became absolute; but before that period their power rose to the highest pitch.

The burghers enjoy greater or less privileges according to the cities of which they are members. Hence those of Copenhagen enjoy the pre-eminence, and have advantages enjoyed by none of the rest. The Danish peasants are of different classes. Some are possessed of a spot of land, which may be considered as their own property, since they only make the lord of the manor some inconsiderable acknowledgment. Others have only a farm, for which they pay a certain rent in money, cattle, or corn, to the proprietors of their farms, and do inferior services at the manor of their lord; but slavery, or a state of vassalage, was entirely abolished in Denmark by Frederic IV. in the year 1702, and is only continued in some part of the dutchy of Sleswic.

SECT. VI.

Of the Prerogative, Court, Titles, and Arms of the Kings of Denmark; the Orders of Knighthood; the public Offices and Revenues; with a concise Account of the military and naval Force of the Kingdom; the civil Government of the Provinces, and the different Courts of Judicature.

THE king of Denmark, as hath been already observed, is an absolute prince, and consequently his prerogative is unbounded. He is pleased, however, to act by the laws framed by his ancestors, or by himself and council; though he has the power of repealing and altering them as he thinks fit. He is the guardian of all the noble orphans, and none can sell or alienate their lands, without leave of the crown, the king being entitled to a third part of the purchase money upon every sale.

He has, however, few ensigns of majesty, except such as are military, as horse and foot guards, yeomen, and the sound of drums and trumpets; for the badges of peace, as heralds, maces, the chancellor's purse, and the sword of state are here unknown. The officers of the household are the marshal, who regulates the affairs of the family, and gives notice when dinner or supper is ready; the comptroller of the kitchen, who places the dishes of meat on the table; and the master of the horse, who looks after the king's stables and studs of mares. The king sits down to dinner with his queen, children, relations, and general officers of the army, till the round table be filled; the court-marshal inviting sometimes one and sometimes another to eat with his majesty, till all have had their turns in that honour. A page in livery says grace before and after meat; for no chaplain appears here but in the pulpit. The attendants are one or two gentlemen, and the rest livery servants. The kettle-drums and trumpets, which are ranged before the palace, proclaim aloud the very minute when his majesty sits down to table; but the ceremony of the knee is not used to the king.

Every winter, the snow is no sooner firm enough to bear, than the Danes take great delight in going in sledges, the king and court first giving the example, and making several tours about the capital in great pomp, attended by kettle-drums and trumpets; their sledges are drawn by horses adorned with rich trappings, and the harness full of small bells. After the court has thus opened the way, the burghers and others ride about the streets all night, wrapped up in their fur gowns, with each his female in the sledge with him.

His Danish majesty's titles at full length are, Frederic V. by the grace of God, king of Denmark and Norway, and of the Goths and Vandals; duke of Sleswic, Holstein, Storman, and Ditmarsch; count of Oldenburg, and Delmenhorst.

The royal arms are parted by the Daneborg cross into four principal quarters. In the first or, three lions passant guardant azure, surrounded with nine hearts gules, for Denmark. In the second gules, a lion rampant crowned or, holding a Danish battle-ax argent, for Norway. In the third azure, three crowns or, the first and second for Sweden. In the fourth or, a lion leopardized azure, with nine hearts gules, for ancient Gothland. The inescutcheon quarterly, in the first or,

two lions passant azure, for the Dutchy of Sleswic. In the second gules, three nettle-leaves argent, pierced with three nails of the cross; these leaves are charged with a small eschutcheon argent, for the dutchy of Holstein. In the third gules, a cygnet argent, gorged with a crown or, for Storman. In the fourth gules, a cavalier armed argent, holding a sword pommel or, for Ditmarsch. Upon all an inescutcheon in the center party per pale or, two bars gules, for Delmenhorst; and azure, a cross pattee or, for Jutland. The supporters are two savages armed with clubs.

The principal order of knighthood in Denmark is that of the elephant, or the blue ribbon, which some authors suppose to be founded in the twelfth century, by Canute VI. while others say, that it was instituted about three hundred years ago by Christian I. at his son's wedding. Its ensign, or badge, is a white enamelled elephant with a castle on its back, appendant to a blue ribbon, worn over the left shoulder to the right side. These knights wear on the left breast a silver star of eight rays, with the Daneborg cross in the middle of it.

The second order of knighthood in this kingdom, is called the Daneborg order, or the white ribbon, which was instituted by Waldemar II. The badge is a gold cross enamelled, and set with eleven diamonds. This hangs at a watered white ribbon with a red border, which is worn over the right shoulder to the left side. These knights wear on the right breast a silver star of eight rays, in which a cross is to be seen, with the word restitutor thus divided, RE-STI-TV-TOR, and the name of CHRISTIAN V. in the middle. Both these orders were revived by Christian V. and have their particular statutes, collars, and mottos.

We shall now give an account of the offices by which the government is administered:

I. The privy council, or, as it is called, the supreme college, was first instituted on its present footing in the year 1679: this college at present consists of four members, and the king, who is president. Under this college are the two following chanceries:

1. The Danish chancery, which was placed on its present footing in 1660, and consists of a prothonotary, a master of requests, several secretaries, two chancery solicitors, notaries, registers, &c. To this chancery all petitions for places in the courts of judicature in Denmark and Norway, as also for civil and ecclesiastical employments, are presented. The prothonotary, with the principal secretaries, and two other persons, as assistants, constitute a chancery.

2. The German chancery, which was instituted in 1688, and consists of a prothonotary, a solicitor, and several secretaries. All petitions relating to the affairs of Sleswic, Holstein, and Oldenburg are given into this court. It also carries on a correspondence with foreign courts and ambassadors; and all treaties and alliances concluded with foreign powers, are dispatched by this college. The members of the weekly chancery-session are the prothonotary, some other secretaries, and two foreigners, as assistants.

II. The military chancery for the land service, which consists of a prothonotary, a recorder, or keeper of the archives, a solicitor, clerks, cursitors, and notaries. This college has the care of military promotions, and in general, the direction of every thing belonging to the army and to war. But the peculiar military œconomy is committed to the general commission for the land service. These commissaries pay, maintain, and recruit the army, fill the magazines, keep the fortifications in repair, and have the care of the artillery. To this college are subject all general commissaries of war; all officers that have the care of provisions, arsenals, and materials for building. The magistrates, and other civil officers, are under their jurisdiction, as far as they have any concern in the marching and quartering of the army. The money expended by this college, which is immediately under the king's command, is issued by the deputies of the finances.

III. The military chancery for the sea service, consists of a prothonotary and solicitor. They order and direct whatever relates to naval promotions, the marine and harbours; but the peculiar management of naval affairs

is under the general marine commission, which has been united to the college of admiralty, ever since the year 1746. The admiralty college was instituted in 1660, and has not only the command of the fleet, but is a superior court of judicature; for all the sentences passed by the inferior court of admiralty come before them. The inferior court of admiralty has power over all civil and military subaltern officers in the navy.

IV. The treasury and the college of the finances, are better regulated than formerly. The first was instituted by Frederic IV. who abolished the college of treasurers, and appointed in their room, a single treasurer and vice-treasurer. He also introduced the college for the finances, which consists of the deputies for the finances, and commissioners of the college of the finances. The deputies, in concert with the commissioners, direct all affairs relating to the finances; but the deputies alone have the management of the public money, make disbursements, and subscribe all contracts. The commissioners are intrusted with the care of every thing else that relates to the revenues, and the imposts in money and corn; they farm the public revenues; have the inspection of every thing that may tend to their improvement and augmentation; and subscribe all representations made by the chamber to the king. The chamber of finances has two chanceries: these are the Danish, or northern, which has a secretary and two agents; and the German chancery, which consists of a secretary and one agent. The chamber court of judicature has a justiciary and an agent, who manage the judicial proceedings of the chamber. The correspondence of the chamber college is carried on, and the accompts of the collectors inspected and adjusted, by seventeen clerks of the revenues. These clerks have their respective departments and offices, of which there are seven, and as many clerks, for Denmark; five for Norway; and five for the German dominions.

V. The general college for the improvement of manufactures and commerce, was instituted in 1735, and consists of deputies and commissioners for the domestic and commercial departments, and of a Danish and German secretary. This college has the direction of every thing that may promote the increase of domestic trade, manufactures, fisheries, and all new foundations or establishments. By virtue of a royal ordinance, issued in 1753, every deputy has his particular department, but is under the controul or check of the general college.

The general ecclesiastical college of inspection was instituted in 1737 by Christian VI. and usually consists of six members, three divines, and as many laymen, who are all called general ecclesiastical inspectors. The third lay-inspector is also secretary of the college, and has one or two secretaries under him. This college has the general direction of all ecclesiastical affairs in Denmark and Norway, and its members inspect into the behaviour of the clergy, and the state of the universities and schools in their jurisdiction: they likewise pass their censure on all theological treatises on religious controversies. This college is also under the king's immediate jurisdiction.

The last college is that of the general post-office, which has the direction of the posts in the two kingdoms, audits the accounts of the post-masters, and inspects into their conduct. This office has its directors, treasuries, and revision chamber. In all towns the couriers for letters go out and come in twice a week. The roads are measured all over the kingdom, and at every quarter of a Danish mile the ground is a little raised, and a stone erected upon it.

We now come to the revenues of Denmark, which arise from the customs, particularly those of the Sound, Coldingen, and Norway. A toll in passing from the northern ocean into the Baltic, and from the last into the northern ocean, is paid in the freights, at Elsinore, Nyburg, and Fredericia, but the principal custom-house is at Elsinore. In some years, above six thousand ships pass through these freights, and consequently the toll is very considerable. This toll is not on an equal footing with respect to all nations; for the Hamburgers are obliged to pay more than others for passing through the Sound. The English, Dutch, Swedish, and French ships

ships are not searched, when they are provided, according to treaties with passes: they also pay down only one per cent. for such goods as are specified in the tariff, while all other nations are not only searched, but are obliged to pay one and a quarter per cent. With respect to the Hanse-towns that lie on the Baltic, there is a great variety in the toll they pay; for almost every one of those towns is treated with in particular. The tolls are, in general, either farmed out or collected by officers appointed for that purpose, and there are comptrollers appointed by the king over the farmers and officers.

The other revenues arise from the excise and consumption.

From the taxes paid by the farming peasants for freeholds and contributions of provisions in Norway; from duties on oxen, corn, and bacon in Denmark; and from redeemed estates.

From the poll-tax, which, however, is never imposed, but upon extraordinary occasions.

From fines, dispensations, stamp paper, and the post-office. The revenues arising from the latter are appropriated for pensions, and for carrying on the foreign missions.

And lastly, from the royal tythes, which formerly belonged to the bishops; but after the reformation were annexed to the crown.

The military forces in the kingdom of Denmark, and the places subject to it, consist of the horse life guards, one regiment of cuirassier guards, and one regiment of dragoon guards; nine other regiments of cuirassiers, two regiments of foot life-guards, one of which consists entirely of grenadiers; the king's own regiment, the queen's regiment, and the prince-royal's regiment; besides nine regiments of infantry enlisted, seven national regiments of infantry, and a regiment for garrisons. In Norway there are five national regiments of cavalry, two enlisted, and thirteen national regiments of infantry, and the light troops, consisting of five or six hundred men. An enlisted regiment of cavalry consists of eight, and an enlisted regiment of infantry of twelve companies; but the national regiments are more compleat than the enlisted. The king of Denmark's whole military force amounts to fifty-nine thousand two hundred and eighty-nine men.

The Danes were antiently very powerful and successful at sea, and in later times, Christian V. and Frederic IV. have performed great exploits with the Danish fleet. It at present consists of thirty-four ships of the line, sixteen frigates, and a number of galleys, which usually amount to fifty. Since the year 1755, the seamen in constant pay consist of four divisions, each division containing ten companies, with a company of artillery, amounting in all to four thousand four hundred men: but the number of registered seamen, with which the fleet may be manned upon any emergency, is about twenty-four thousand, which in Denmark are distributed in six districts, and in as many in Norway, they being under the direction of certain officers appointed for that purpose. There is also in Denmark a company of sea cadets instituted by Frederic IV. in the year 1701.

The fleet is laid up at Copenhagen, and the naval stores, with the materials for ship building, are in great plenty, and kept in very regular order. Floating block-houses are used upon occasion with great success in the Baltic.

Justice is no where obtained with more expedition than in Denmark. The whole body of their laws is contained in one moderate quarto volume, written in their own language in so plain and intelligible a manner, that it scarce needs a comment. This excellent work is intitled *Codex Christianeus*; it was published in 1683 by Christian V. and is the only law observed in Denmark.

Every general government has its general governor, who is always a person of distinction, and usually a knight of one of the orders. His power is very great, and extends both to spiritual, temporal, and judicial affairs. He has likewise authority over the revenues, towns, and country within his jurisdiction. Under the governor are the prefects, who are also noblemen, or at least persons of distinction; but they have no power in the towns within their jurisdiction, which extends only to the open country. The civil government in the cities and great

towns is lodged in a burgomaster and council; but in smaller towns in a kind of headborough. Many towns have also a royal president, and several of them have the privilege of holding courts of justice.

Besides the town courts of judicature, and those held by the nobility in their own manors, there are three other courts, the ting-court, land-court, and the supreme tribunal. In the ting-court causes are generally first brought, both in the towns and in the country; every small district consisting of forty or fifty villages, or hamlets, which have their headborough, a judge, and a secretary; to which are added eight peasants. These courts are held weekly. From this inferior court an appeal lies to the provincial court, or assizes, which commonly consists of two judges and a secretary, and is held once a month in several of the principal towns. The other court, from which there lies no appeal, is the supreme tribunal at Copenhagen, which is held almost all the year round, and is opened by the king in person every year, about the beginning of March. This court, where the law is silent or doubtful, has a power of determining the affair; and, it is said, that through all these courts a suit is carried in the space of thirteen months, and the whole expence, notwithstanding the appeals from one court to another, amounts to no more than ten or twelve pounds sterling. They have indeed no inns of court, or public societies of lawyers; but every one who pleases may take up the profession; yet the fees are so low, that there are few advocates: and there is the less occasion for them, as every man is at liberty to manage his own suit, and plead his cause himself. The greatest expence arises from the stamp paper, upon which the proceedings are written; and, to prevent this being excessive, the clerks, or registers, are obliged to bring the whole matter into a certain number of sheets, as well the allegations and proofs, as the sentence itself, which are all reduced to writing. In the inferior courts the reasons on which every sentence is founded are expressed, but not in the supreme court. The judges of the inferior courts, whose salaries are very inconsiderable, are not only punished for misdemeanors committed in the execution of their office, but are obliged to make satisfaction to the party injured by an unjust sentence.

Our merchants who have had occasion to prosecute suits in this country, admire the equitableness of their laws, and the ease with which justice is obtained.

The crimes of high treason, robbery, and house-breaking are seldom heard of in Sweden; and seditious discourses, and practices are still more uncommon. The punishment for capital crimes is beheading, which is usually done by one stroke with a sword.

In the city of Copenhagen is an officer called the polity-master, who takes care that good orders are kept, composes differences among the merchants, and sees that their merchandize is good and saleable. He causes the streets, bridges, and canals to be cleansed, kept in good repair, and free from nuisances or obstructions. He takes care that the city be supplied with corn fit for bread at a moderate price; seizes prohibited goods, and assists at the extinguishing of fires; for the mob is not suffered to rush in on these occasions; but have companies like our firemen, whose proper business it is, who are provided with instruments for the purpose; and no other persons must approach within a certain distance of the place. The polity-master also causes people to be apprehended who walk the streets by night, no person being allowed to be abroad after beating the tattoo. He likewise suppresses riots and tumults in the streets. The polity-master is also the general game-keeper, and has the power of seizing guns, nets, and venison unlawfully taken.

We shall conclude this account of the government and administration of the laws, with observing, that the Danes seem to be very apprehensive of the abuses of apothecaries in selling and applying their drugs; for they permit no person to exercise that profession who is not appointed by the college of physicians, and confirmed by the king himself. Not long ago there were but two of them allowed in the city of Copenhagen, and one in every other great town, which would doubtless be much too few did not some of their physicians prepare their own medicines. The apothecaries shops are visited by
the

the magistrates and physicians two or three times a year, and the bad or decayed drugs taken and destroyed. The prices of all drugs are fixed, from which they durst not vary. They keep exact books of what they sell, and to whom, that where an ill accident happens it may be known who has occasioned it; and for the same reason they are obliged to file all the prescriptions that are brought them.

We shall now describe the Danish islands, and, beginning with the east, give a particular account of what is most worthy of notice.

SECT. VII.

Of the general Government of Zealand, with a Description of that Island, and of the Islands Amac, Mona, Bornholm, and other smaller Islands; with the principal Places in each, particularly of the City of Copenhagen, the King's Palaces, and the most remarkable Cities in that Government.

THE kingdom of Denmark is divided into seven governments, the most easterly of which is that of Zealand, which contains sixteen prefectures, in which are included all the above islands, and the most considerable places belonging to this kingdom.

The island of Zealand, in the Danish language called Saland, or Sialland, is seated at the entrance of the Baltic, and is encompassed by the Categate on the north; the freight called the Sound on the east; the Baltic sea on the south, and the freight called the Great Belt on the west. This is the largest of all the Danish islands, it being about seventy miles in length, and sixty-five in its greatest breadth.

The soil of this island is tolerably fertile, and produces fine barley, of which malt is made, and a great quantity of the latter is exported from this island; it likewise yields plentiful crops of fine oats, but the rye is not more than sufficient for home consumption. It has fertile meadows of a beautiful verdure, and some woods of oak and beach; but in the country lying near Copenhagen, and some other parts, no woods are to be seen, and the inhabitants are obliged to use chiefly turf for their fuel. There are several lakes in this island, some of which are pretty large, and well stocked with fish; and the rivers, which are in every part of Zealand, also abound in fish. The most convenient harbour in the island is that of Copenhagen, and next to that the port of Kallundborg. Within the prefecture of Copenhagen is the city of that name, of which we shall now give a particular description.

Copenhagen, the capital of the kingdom of Denmark, and the place where the court resides, is situated on the Baltic, in the fifty-fifth degree forty minutes fifty-nine seconds north latitude, and in the twelfth degree fifty minutes east longitude, about thirty miles from the Sound, and has a beautiful and commodious harbour. It is in a low and marshy situation; but on the land side are several fine lakes, which furnish the inhabitants with plenty of fresh water. The adjacent country is very pleasant, and opposite to the city lies the fertile island of Amac, which forms the harbour, and which we shall describe in its proper place. The city at a distance makes a magnificent appearance, and from the west gate to the Norway gate in the citadel, extends four thousand one hundred and forty Zealand ells in length, and from the north gate to the Amac gate it is three thousand one hundred and twenty ells in breadth; so that its circuit must be twelve thousand six hundred ells, or six miles six hundred ells. The Gother-street, which runs in a straight line across the whole city, dividing the Old from the New Town, is above four thousand two hundred feet in length. This metropolis contains four royal castles, ten parish and nine other churches, a considerable number of public and private palaces, above four thousand burghers houses, several of which are inhabited by ten or more families, eleven markets and public squares, a hundred and eighty-six streets, and a hundred thousand inhabitants.

This city is divided into three principal parts, Old Copenhagen, New Copenhagen, and Christians-hafen. As the two last are more modern than the first, they are laid out in broad streets that run in a straight line. Most of the streets in Old Copenhagen since the last great fire have been made of a sufficient breadth; but the old windings could not be entirely avoided. The houses in the principal streets and squares are almost entirely built with brick; but in the lanes most of the buildings are of timber. However, in general they make a handsome appearance. The city is at the annual expence of ten or twelve thousand rixdollars in keeping the streets clean, and in the night it is illuminated with lanterns. In some parts of the city are deep canals into which large ships may enter, and, to the great convenience of the merchants, may lade and unlade close to the warehouses.

Besides the above three general divisions, the city is divided into twelve quarters, and the burghers into as many companies, which have all their particular colours.

The Old Town consists of the following quarters. First, the north quarter, which has the following places of note: the German church, dedicated to St. Peter, which was the principal parish church at the time of the reformation; it was afterwards converted into a foundery, but in 1585 was given to the Germans, and in 1618 was again made a parish church.

The Walkendorf college in St. Peter's street was formerly a Carmelite monastery; but the lord steward, Christopher Walkendorf, converted it into a college for sixteen students, each of whom has a yearly pension of thirty rixdollars.

The second is the west quarter, in which are the great Wartow hospital, which is an antient foundation; but the edifice is new and spacious, and the endowment so considerable, that it contains at present above three hundred beds for the sick and poor, each of whom hath his lodging gratis, and a weekly allowance of half a rixdollar. Close to the hospital stands a small commodious and neat church, which is so contrived, that the sick and bed-ridden may hear divine service and sermons in their beds.

The city prison, which has also its particular church.

The orphan-house, which takes up one entire side of the new market, and is a considerable ornament to that square. The present building was finished in 1734, and contains a hundred poor children, that is sixty boys and forty girls, who are maintained and educated; but at present the number is increased to a hundred and eight: it has a particular church, a dispensary, a printing-house, and a library belonging to the foundation.

The council-house is a new structure, and, being detached from the other buildings, separates the Old from the New Market. In the Old Market is a fine fountain, and in the New is a place walled in for the execution of malefactors.

The other places in the west quarter worthy of notice are the west gate, and the royal palace, situated near the citadel of Christiansburg, which in 1743 and 1744 was new fronted in a very elegant manner.

The third is the clothiers quarter, in which are the following places worthy of notice. The collegiate church of St. Mary, in which the bishops of Denmark and Norway are usually consecrated. The tower, which is esteemed the noblest in Copenhagen, stands on the highest spot in the whole city; it is three hundred and eighty feet in length, and has a fine ring of bells. The university, which includes the royal community, or the cloyster, in which a hundred poor students had formerly two meals a day; but at present they receive a pension instead of provisions; and in this edifice they hold their daily disputations. It likewise contains the consistory, the auditories, or halls, the rector's house, and other buildings. To the university also belong four spacious colleges, well endowed for the maintenance of the young students gratis. The Walkendorf college has been already mentioned. The other three are the royal college founded by Christian IV. for a hundred and twenty students, though no more than a hundred now reside in it. The Collegium Elerianum, founded by George Elers, for sixteen students.

The

The Borrichian College, or the Collegium Medicum, is the most elegant and best endowed of all the private foundations. The learned Olaus Borrichius erected this college in 1689, for sixteen Danish and Norwegian students. Every student has apartments gratis for five years, with an annual pension of sixty rixdollars. The library and cabinet of curiosities which joined to this college were burnt down in 1728, but have since been in some measure restored.

The last place we shall mention in this quarter is the north gate, which is the most elegant structure of the kind belonging to this city, and was erected in 1671.

The fourth division is the freemen's quarter, in which are two churches, and the church of the Holy Ghost, or rather of the Holy Guests, it deriving its name from a large hospital or guest house that formerly stood near it, and was converted by Christian IV. into a house of correction. This church was rebuilt after the fire of 1728.

The fifth is named Snarren's quarter.

The sixth is called Strand quarter, and contains the following places worthy of notice. The magnificent royal palace of Christiansburg, which was enlarged and embellished by Christian III. Christian IV. and Frederick IV. but being very irregularly built, Christian VI. caused the whole building, with the adjoining houses, which had been purchased of the burghers, to be pulled down in 1731, and the following year laid the foundation of the present spacious and magnificent structure, which was finished in 1740. The first floor is called the ladies story, because most of the ladies and gentlemen in waiting have their apartments there. The royal treasury and cash-office are also kept here, and the king's court of justice and the burghers court are held in other apartments. The office of the general superintendants of the buildings is likewise in this story. In the second or royal story the apartments are adorned with the utmost magnificence and elegance. The supreme court of judicature is likewise held in this story. The prince royal's story is thus named from his highness and the princesses royal having their apartments in it, which are extremely elegant and well contrived. The inside of the royal chapel is also very beautiful and magnificent. The chancery is joined to the palace by a corridore, or covered gallery, and is a superb structure. In the lowest story, which is vaulted, are kept the archives of the kingdom. In the second is the privy-council-chamber, and also the chanceries of Denmark, Norway, and of the German dominions, the military colleges, and the college of the finances. In the third story are the offices belonging to the treasury, and the rent-chamber.

In this quarter is also an edifice in the first story of which is the arsenal, and in the second the king's library, which is above two hundred feet long, and contains about sixty or seventy thousand volumes. In the third story are the royal cabinet of curiosities, the picture-gallery, and the cabinet of medals; and in the fourth story is the cabinet of models.

In the royal cabinet of curiosities, just mentioned, are several large pieces of silver ore dug out of the mines of Norway in 1666, one of which weighs five hundred and sixty pounds, and is valued at five thousand crowns: another piece is valued at above three thousand, both being supposed to contain at least three parts silver. They are composed of a whitish stone, the cavities of which seem filled with pure virgin silver, which in some places lies in broad flat plates, and in others like pieces of fine silver lace; but what are most admired are the threads and branches of silver, which shoot out an inch or two beyond the stone, in form of small shrubs or bushes. Here are likewise several large pieces of amber, some weighing forty or fifty ounces. Upon opening the ditches about Copenhagen these were found sticking, like the gum on the plumb trees in our gardens, to the sides of the old trees that were buried there. Among the artificial curiosities is a piece of ivory, on which is the history of our Saviour's passion beautifully expressed in relieve. There is likewise a small man of war in ivory, with silver guns, which is much admired; as is also a watch made of ivory, and a skeleton made of the same substance two feet six inches high, and so nicely formed, that it is scarcely to be distinguished from a natural one.

There are besides many other curiosities in ivory, ebony, box, amber, and other materials kept for the sake of the elegance or minuteness of the workmanship; and, it is said, there is a common cherry-stone on the surface of which are engraven two hundred and twenty heads, but their smallness makes them appear imperfect and confused.

In this quarter is likewise the magazine for provisions, the post-office, and the exchange, which is a grand structure in the Gothic taste, four hundred and six feet in length, and sixty-six in breadth, the greatest part of which was built in 1624 by Christian IV. The lowest story is laid out in warehouses, which are very commodious for the merchants; for on both sides of this structure are canals where the ships may lie close to the warehouses, and goods be conveniently landed or shipped from them. In the second story in the north side is the place where the merchants usually meet. In the middle and down the whole length on both sides is a range of shops; in one wing of the south side is the royal bank, and in the other the royal magazine, where most of the cloths, silks, and stuffs made in the city are deposited, and from thence sold to merchants and dealers.

The seventh is the Rosenberg quarter, in which is a Calvinist church, a small neat edifice, where the ministers preach in French and high Dutch; and the Trinity church, generally called the Round church from its round tower: its arched roof, which is pretty high, is supported by two rows of very slender octangular pillars, which give it the air of a very light building. This edifice suffered less than the other churches in the great fire in 1728, and was soon repaired. The greatest loss was the noble collection of books belonging to the university, kept in a large room over the arched roof of the church. However, a new library has been since collected, in which are several valuable manuscripts relating to the Northern history. The tower of this church is esteemed a master-piece of its kind, and was designed by the celebrated Christian Longomontanus, the astronomer. It is round, a hundred and fifteen feet high, and fifty-four feet in thickness; flat on the top, and surrounded by an iron balustrade. The ascent is spiral, and so spacious and easy, that a coach and horses may go up and down again with ease; which experiment was tried by Peter the Great in 1716. This tower was designed for an observatory, but the curious astronomical and mathematical instruments, invented by Tycho Brahe, Olaus Romer, and others, which were kept here, were all consumed by the great fire in 1728; but afterwards Christian VI. procured the most curious and valuable mathematical and astronomical instruments, to supply the place of those that were burnt.

The eighth is the manufacturers quarter.

The ninth is the east quarter, in which are the following places of note: the church of St. Nicholas, which, next to St. Mary's, is the largest in the city, and the best ornamented both within and without; the roof is covered with copper, and it has several curious monumental inscriptions.

The Bremer Holms church, also called the admiralty church, it being first allotted for the use of persons belonging to the navy; but afterwards a large congregation of burghers were added.

The general commission-office is a large structure erected by Frederic IV. in the year 1704. Here the united colleges of the admiralty and general commission meet. Besides this structure, the following edifices belong to the naval department: the Old or Bremer Holm, and the New Holm, where the naval stores are distributed: Christiansholm, where is the naval arsenal, which far exceeds that of Venice, and where the royal fleet usually lies.

The New Town consists of two quarters: the first is St. Ann's east quarter, in which are Charlottenburg, a pretty large and regular structure, begun in 1672, and completed in the succeeding years. It derives its name from queen Charlotte Amelia, consort of Christian V. The situation of this castle or palace is very agreeable, its principal front facing the square called the King's New Market, which is embellished with an equestrian statue of Christian V. of lead gilt, placed on an elegant pedestal. On the sides of this fine square are also the

great guard-house, the foundery, and the Danish play-house.

There are also in this quarter the naval hospital, the church belonging to the garrison: the Frederickstadt, which is now adorned with several elegant new palaces: Frederick's church, built in imitation of St. Peter's at Rome: the general hospital: the tolbooth, or custom-house; and the grand academy of the royal cadets. This last structure was built by Frederick IV. for an opera-house; but in 1720 he assigned it for the land cadets; and, five or six years after, removed the company of sea cadets to this edifice. Each company has its separate apartments and exercising-rooms, and is under the inspection of its proper officer, who likewise lives in the academy. These young men are not only supplied with lodging, cloathing, fire and candles, and a monthly pension sufficient to find them in diet; but are also instructed at the king's expence in all the sciences by able masters appointed for that purpose. These two companies are a kind of nursery for the army and navy.

In St. Anne's west quarter is the royal palace called Rosenburg, a small edifice built by Christian IV. in 1604, in the semi-gothic taste; but is a grand structure, adorned with one large and two small towers. It is surrounded with a ditch and a kind of fortification, and has its own commanding officer; but the guard is daily relieved from the garrison of Copenhagen. The adjoining gardens are very extensive, and embellished with a great number of ornaments. These, in summer, serve the inhabitants for a public walk, and the royal family sometimes reside a few days in this palace. The third story of the palace is said to be the most remarkable from its containing a treasure of inestimable value. In the great hall, which is in this story, and takes up the whole extent of the building, are five pieces of painting by the Danish artist Krogk; twelve valuable pieces of tapestry, representing the achievements of Christian V. and three silver lions as large as the life, which at the king's inauguration are placed round the throne. In two cabinets adjoining to the hall are kept the old and new regalia, with other valuable jewels, and a whole service of gold. Another cabinet has a collection of curious and valuable drinking glasses, and other glass vessels. The royal throne used at the inauguration stands in another apartment.

Christianshafen consists only of one quarter; it is situated on the island of Amac, and had formerly its own magistrates; but is at present under the jurisdiction of those of Copenhagen. The most remarkable places in this suburb are St. Saviour's church, which is esteemed the most magnificent and elegant church at Copenhagen; and has a beautiful steeple, that has a spiral ascent on the outside, by which one may go up to the top. The German, or Frederick's church; the orphan-house for the education of two hundred poor boys; the East India company's house; the fine dock-yard, where ships of war are refitted; and the gate of Christianshafen.

Between Copenhagen and this suburb is a high pillar erected in the midst of the water, on which is a statue of a naked woman, with a swan on her left side that extends its long neck behind her back, and, bringing its head over her right shoulder, puts its bill into her mouth. This pillar and statue are considered as a symbolical representation of the city of Copenhagen: they were, however, found near Calmar, in Sweden, during the war in 1611, and from thence conveyed to this city.

In this city the Calvinists have a church to themselves; those of the Romish religion frequent the chapels of foreign ministers of that profession, and the Jews have their synagogues.

The magistracy of this city is appointed by the king, and consists of a president, three burgomasters, with vice-burgomasters, and common-council men.

Besides the supreme and other colleges, academies of painting and drawing, the Theatrum Anatomico-Chirurgicum, trading companies, the bank, and the office of insurance already mentioned in treating of this kingdom in general, they have an insurance-office for cash, fire and water-offices, and different manufactures, in which silk and woollen stuffs, cloths, fine gold linen, and silver lace, porcelain, &c. are made.

This city has been frequently visited by the plague, which swept away great numbers of the inhabitants. It has often been besieged, and in 1658, and 1659, held out against the Swedes almost two years; and in 1700 was bombarded by the combined fleets of Sweden, England, and Holland. On the twentieth of October, 1728, a fire broke out in the evening in a mean house near the west gate, which spread with such fury, that in forty-eight hours the most elegant and greatest part of the city was reduced to ashes. Twenty-four streets and squares, a thousand six hundred and fifty dwelling-houses, five churches, the university, with the four colleges belonging to it, the council-house, and several other public buildings, were burnt to the ground. The anniversary of this dreadful accident is observed in a religious manner on the twenty-third of October. The city has, however, been since rebuilt with greater elegance and beauty.

As the suburb of Christianshafen is seated on the island of Amac, it is necessary to take some notice of that island, which is joined to the city, and consequently to Zealand, by two bridges. That island is about nine miles in length, and three in breadth: it is entirely level, and has no woods, except a few thickets. The soil is uncommonly rich and fertile, and is therefore called the garden of Copenhagen. A part of it was given in 1516 to several families, who were invited thither from North Holland by Christian II. at the desire of Elizabeth his queen, who was a native of the Netherlands, to make butter and cheese for the court; and their descendants still retain the habit, language, and customs of their predecessors, together with their cleanliness and industry; for they will not mix with the Danes, but intermarry with each other. This island, through the industry of these laborious people, plentifully supplies the markets of Copenhagen with all sorts of roots and herbs, besides butter, milk, great quantities of corn, and some hay. The whole island is divided into two parishes, and is peopled by about eight hundred families, many of whom are Danes.

In the neighbourhood of Copenhagen, is a magnificent royal palace, situated on a hill. It derives its name from Frederick IV. who was its founder, and has been since greatly enlarged by Christian VI. This edifice is very spacious; on every side it makes a most magnificent appearance, and has a fine prospect. The garden, which lies below the hill, is very extensive, and contains a great number of pleasant walks, several groves, a labyrinth, a theatre, many statues, fountains, and summer-houses; and, in particular, a very fine cascade just fronts the palace. From this edifice is a descent into the garden by two flights of broad stone steps. The menagery in the garden is stocked with lions, tigers, and other wild beasts. From this palace a pleasant avenue, planted with a double row of trees, extends above half way to Copenhagen.

Jagersburg is a royal hunting-seat, rebuilt by the present king; here the officers of the chace reside. From hence a straight avenue leads to the noble park of Charlottenlund, so called from the king's pleasure-house, which stands in it.

At about the distance of a mile from this park lies that of Jagersburg, which affords a great deal of game. About the middle of it stands a new edifice called the Hermitage, which is thirty ells in length, twenty in breadth, and elegantly adorned both within and without. In the lowest story is a curious machine, by means of which the victuals, &c. are conveyed to and from the king's table in the second story, when his majesty dines there.

At the distance of about five miles is the castle of Hirschholm, a royal palace, which was antiently a place of considerable strength: but nothing now remains of the old castle, besides the name; for it is not only demolished, but the very situation of the place has been entirely altered by art. Christian VI. who took possession of it as prince royal, caused the foundation of a new edifice to be laid on the spot where the old castle stood, and his queen, after his accession to the throne, continued the building, the king having made her a present of it. In 1739 it was thought to be finished; though every year since, new improvements and embellishments have been continually

continually added. The outside has a very magnificent appearance, nor is it less elegant within. The great hall takes up the height of two stories, and has a noble fountain that throws up a column of water above twenty feet high, which falls down again into a copper basin. The chapel is elegant and well adorned, and the garden very beautiful. At the extremity of it, directly opposite to the palace, is a noble summer-house; and on one side of the garden is an eminence covered with trees, on which stands the Norway-house, which is so called from its being built in the Norwegian taste.

At the distance of about twenty miles from Copenhagen, is the famous castle of Fredericksburg, which is esteemed the most beautiful of any belonging to the king, and is frequently called the Versailles of Denmark. Christian IV. caused the old building to be demolished, and the present magnificent structure to be built by the ablest and most celebrated architects in Europe. It stands in the midst of a lake of fresh water, and consists of three principal parts, each surrounded with water, but joined together by bridges. The first division, to which you arrive by passing over a bridge, resembles a horn-work, the front of which is quite round, and faced with stone. On both sides are several buildings, which serve either as dwelling houses for the officers of the castle, or stables for horses. From hence you pass over a stone bridge to a noble high tower, which stands over the gate that leads into the second court. On each side of this court to the right and left, stands a magnificent building, in one of which are the governor's house, several apartments for the noblemen belonging to the court, and the king's kitchen; and on the other the chief magistrate of the prefecture of Seroe resides. From this second court a fine stone bridge, built over a deep canal, leads to the grand portico of the chief entrance of the castle, which is built with free-stone, and adorned with sculpture and gilding. The principal building consists of a corps-de-logis, and two wings, four stories high, all covered with copper, and adorned with several towers, of which the church tower is the highest. Both the wings are joined to the front by a low building of one story. Upon the first entrance into the inner court, the magnificence of the structure, the beauty of the marble, the elegance of the sculpture, and the richness of the gilding, fill the beholder with astonishment; but what principally strikes the eye is a noble imitation of the ancient architecture, consisting of two grand arcades, one over the other, in the front of the building. These consist of seven arches below, and as many above, built with free-stone, and embellished with statues that stand either in niches or detached from the wall, with many other ornaments. Near one of the wings is a beautiful fountain; and which way soever you turn your eyes, curious sculpture, and a variety of other embellishments, present themselves to view.

The gallery that leads to the hall of audience, is adorned with a fine collection of paintings, most of them brought from Italy; and the hall is hung with the pictures of several of the Danish kings, and of the present royal family as large as the life. The exploits of some of these monarchs are also beautifully painted in different parts of the palace, and the great actions of Christian IV. are represented in rich tapestry. In the church belonging to the castle, the eye is in a manner dazzled by the glittering of the gold, silver, and curious marble, with which it is embellished. The altar is of black marble, the front of the table is of silver and ebony, and the pulpit is of the same materials. From the gallery you have a view of the large pictures with which the pilasters between the windows are decorated. In the windows, and on the walls of this church, are the escutcheons of the knights of the Danebrog order. The gallery leads to a spacious place behind the altar, where the royal throne is erected; and on the walls, which are hung with crimson velvet, are seen the arms of all the knights of the order of the elephant. The grand organ in this apartment, is curiously embellished with sculpture and gilding. Formerly a fine organ of silver and ebony likewise stood here. The kings of Denmark are always anointed in this church. In the tower is a fine ring of bells. In short, all the apartments of the castle are very magnificent,

especially the knights ball-room, which is over the church in the third story, and has also a noble organ. There is a fine garden behind the palace, and the neighbouring park is interspersed with canals and fish-ponds, and agreeably diversified with a mixture of grass-plats, and little hills and valleys, well stocked with fallow-deer from England.

At the distance of about eighteen miles from Copenhagen, is Elsinore, or Elfsineur, a town situated on the Sound, directly opposite to Elfsingburg in Sweden, in the fifty-sixth degree eight minutes north latitude, and in the thirteenth degree twenty-three minutes east longitude. This is the richest and most elegant town in Zealand, next to Copenhagen. It has two churches, in one of which, named St. Peter's, the ministers preach in the German language. There is here also a grammar school, in which thirty-three poor scholars are educated and maintained gratis, a good hospital, and the king's custom-house, which is a fine edifice newly built. Elsinore has a considerable trade, and is famous, both on account of its being the place by which the Swedes and Norwegians usually pass into Denmark, and for the toll paid here by every ship that sails through the Sound. On the north side of the city stands the famous and important castle of Cronenburg, which is built with large blocks of hewn stone, in the most durable manner, and is adorned with several turrets and a variety of sculpture. The fortifications of this castle are in excellent order.

Friedensburg is a royal palace, pleasantly situated about nine miles from Cronenburg, in latitude fifty-five degrees thirty-six minutes. Frederic IV. was invited to build this palace by its delightful situation, and as the edifice was completed in 1720, when the treaty of peace was concluded with Sweden, the king gave it this name, the word *frieden* signifying peace. This prince, being extremely fond of this place, often resides here, and therefore, to render it as agreeable as possible, endeavours to supply by art whatever beauties were denied it by nature. The inner court is a regular octagon, formed by seven wings, one story high, and the main building, which is opposite the principal entrance. In the midst of the court is a fountain adorned with a marble statue of peace, made at Florence. The main building is in the form of a parallelogram, and covered with copper, and in the middle has a spacious, light, and elegant square hall. The other apartments in both stories are nobly furnished. The garden is not very extensive, but is well laid out, and embellished with statues, vases, and other ornaments. It is surrounded with a large wood, that affords plenty of game, and in which several vistas are cut. From the palace is a delightful prospect, the eye commanding almost all the vistas at once, and at the end of them is an extensive lake, in which is a beautiful yacht. Near the palace is also a fine orangery, and an elegant church. In the wood which joins the garden, is a manegery stocked with a variety of beautiful tame and wild fowl.

Roschild, or Roeskild, is an ancient city about a mile from the extremity of a bay called Isefiord, and derives its name from Roe, the eleventh king of Denmark, who was its founder, and the word *kilde*, which signifies a spring; there being several excellent springs on the spot where it stands. This city is situated in the fifty-fifth degree thirty minutes north latitude, and in the twelfth degree fifteen minutes east longitude, and once contained twenty-seven large churches and convents within its walls, and its streets extended to the sea-shore. The kings of Denmark were formerly elected and crowned here, and also made it the place of their residence. But frequent fires, the tyranny of the bishops, and the flourishing state of Copenhagen, have so far reduced this city, that it at present consists of only an inconsiderable number of houses, which are for the most part meanly built. The inhabitants support themselves by trade and industry, but their chief employment is agriculture and the planting of tobacco. The cathedral is a standing monument of the ancient grandeur of this city, though it has been three times consumed by fire; it being adorned with many monuments of the kings and queens of Denmark. A small royal palace was built here in the year 1733 that has a

communication with the church, by means of a covered passage.

In the cathedral school, six masters and forty scholars are maintained and educated. Here is also an hospital for six poor widows; and in 1699 a convent was founded in this town for twenty-one ladies of quality, and a prioress. Each of these ladies has an annual pension of eighty rixdollars, besides lodging and board. Christian V. also endowed this protestant convent with five hundred rix-dollars a year. At the other end of the town is a church dedicated to the Virgin Mary, in which, money was formerly coined, and a multitude of relics was preserved.

The city of Calinburg, or Kallundborg, in the prefecture of the same name, is one of the most flourishing towns in Zealand, and has the best harbour in the island, except Copenhagen. St. Mary's church, which has four lofty spires, makes a good appearance. The inhabitants carry on a considerable trade, and a great quantity of malt is annually exported from hence. The passage to Barhuus in Jutland is usually performed in twelve hours; and a certain number of smacks sail twice a week from one town to the other.

The island of Samso, in Latin Samsoa, lies about thirty-eight miles to the north-west of Kalinburg, and nineteen from Arhuse in Jutland, in the fifty-sixth degree north latitude. It is about fourteen miles long and five broad. It has several hills and eminences, and the soil is for the most part fertile, and in particular yields plenty of peas, whence most of the inhabitants are in good circumstances, and carry on a considerable trade with their small craft. It consists of five parishes, and is surrounded with several very small islands and sandy shoals.

Sora is a little noted town, in a pleasant country, in the prefecture of the same name. It is situated ten miles to the south of Roschild; where it is surrounded by three lakes of fresh water, and these are again almost encompassed with fine woods. This town is remarkable for the royal academy situated at the south end of it, to which belong a grand master, an inspector, professors in all the sciences that relate to civil or political employments, a French master, a riding master, with proper masters for fencing, dancing, and drawing. There is also a printing-press set up in this academy. The students have their apartments in a large and commodious stone building.

The island of Mona, Moen, or Moon, as it is usually called in our maps, lies near the coast of the south point of Zealand, in the straits called the Wolfsund; it is situated in fifty-five degrees twenty-one minutes north latitude, and is nineteen miles in length from east to west, and about nine in breadth. The high chalky cliffs towards the Baltic may be seen at a great distance at sea, one of which has some resemblance to a throne, and is therefore commonly called the king's chair. Stones of an uncommon figure are in great plenty on this coast. The soil of the whole island is fertile, and yields great plenty of peas. It consists of one prefecture, and contains seven rural parishes, and the little town of Stege, situated in the middle of the island.

The island of Bornholm, in Latin Bornholmia, or Boringia, is situated in the Baltic, in the fifty-fifth degree fifteen minutes north latitude, and in the fifteenth degree ten minutes east longitude, about seventy-six miles from the extreme point of Zealand, and extends about thirty-three miles in length from north-west to south-east, and is nineteen in breadth. The soil is fertile, and produces all kinds of grain, particularly oats. Here is also good pasturage, and a great quantity of butter is exported from hence; it has also quarries of marble and lime-stone, and abounds with pit-coal. The coast, from its dangerous rocks and shoals, is inaccessible almost on every side; but where there might be any danger of an enemy's landing great guns are planted. At the peace of Roschild in 1658, it was ceded to the Swedes; but the inhabitants being treated with great severity by their new masters, they took up arms the same year, and, under the conduct of Jens Koefod, recovered their liberty, after which they delivered up the island to the king of Denmark, who, pleased with this proceeding, sent them a letter of thanks, and in a second letter promised to take

them under his immediate protection; an engagement which the succeeding kings have confirmed from time to time, and Bornholm has been ever since an hereditary country, belonging to the kings of Denmark. In 1678, five thousand Swedish troops were stranded on this island, in their passage from Pomerania to Sweden, when, notwithstanding their being provided with Danish passes, those that escaped the fury of the waves were made prisoners of war. The inhabitants defend the island with their own militia, without any expence to his Danish majesty, and have a governor, deputy-governor, prefect, and other officers. The island consists of one prefecture, which contains about a hundred villages, and sixteen rural churches.

S E C T. VIII.

Of the general Government of Funen, including a Description of that Island; and of the Islands of Langeland, Falster, and Laaland, with the principal Towns in each.

THIS government is the second in order, and includes Funen, Langeland, Falster, Laaland, and other smaller islands. It has two governors, under one of whom are Funen and Langeland, and under the other are Falster and Laaland.

The island of Funen, called in Latin Fionia, and by the Danes Fyen, lies between the Great and Little Belt. It is about fifty miles in length, and forty-five in breadth. It received its name from its being a fine country, the whole island being fertile and very pleasant; whence most of the noble families of the kingdom reside there. Indeed, it is not easy to find in any other place of such small extent, so many noblemen's seats as there are in this island. The soil yields such plentiful crops of grain, that the inhabitants may annually export above a hundred thousand barrels of rye, barley, oats, and peas, to Norway and Sweden, exclusive of their home consumption. It also produces a vast quantity of buck-wheat, which is chiefly cultivated by the inhabitants. They employ a great deal of care in breeding bees, and make a considerable quantity of fine mead, which is exported to all parts of the kingdom. The apples that grow in this island are also much admired, and it likewise produces plenty of hops and esculent herbs; but the scarcity of wood obliges the inhabitants chiefly to use turf for fuel. There are in this island two mountains of considerable height, several fresh water lakes, and rivers that abound with fish; but none of them are navigable. In the bays, and all along the coasts, are taken a great quantity of sea-fish, particularly turbot, cod, herrings, and eels.

The whole island is divided into five prefectures, the principal places in which are,

Nyborg, or Niburg, in Latin Neoburgum, a strong town on the Great Belt, and though not very large, has a commodious situation, and is well built. The parish church and the council house are the best in the island. The harbour is large, but neither sufficiently deep, nor sheltered from some winds. The town is seated in the fifty-fifth degree twenty-seven minutes north latitude, and in the tenth degree fifteen minutes east longitude. The inhabitants subsist partly by accommodating the passengers who daily cross over from hence to Zealand, or return hither from thence, and partly by commerce. The ships that pass through the Great Belt are obliged to pay toll here, for which purpose a man of war is always stationed in the Belt. This city was first built in 1175. All that remains of the royal ancient palace, where Christian II. was born in 1481, and when an infant carried up to the top of it by a monkey, and brought down again without receiving any hurt, is only a large wing, with a flat tower, a little higher than the roof, and at present serves for a magazine and an arsenal.

Odensee, in Latin Othinia, is a city of great antiquity, and the capital of the general government; it is pretty large and populous, but the greatest part of the city is old and decayed; some of it is, however, new and well built. It is said to have been erected before the Christian era, and to derive its name from the idol Odin, and not as some have imagined from the emperor Otho I. who never

was

was there. It is situated in a fine plain, in the fifty-fifth degree twenty-five minutes north latitude, and in the tenth degree thirty minutes east longitude, on a river that yields a variety of fish, and about a mile below the town runs into the gulph of Stegestrand. The city is about a mile and a half long, and half as broad. It has four churches, among which the cathedral is the most remarkable: the inside has been lately repaired and beautified; but the architecture is old and mean. In the Grey Friars, or Franciscan church, are interred king John, and Christina his queen, with their son Francis, and king Christian II. The table of the altar, which was the gift of the above-mentioned queen, is extremely beautiful. Near this church is a handsome hospital, built in the year 1540. The king's palace is neither large, commodious, nor elegant; it being only erected as a lodging for Frederick IV. in his occasional progress through Funen; but there that excellent prince died in 1730. In this city is a college, erected and liberally endowed by Christian IV. and also a large cathedral school, consisting of six classes, where all the scholars, besides their education, receive a small pension, and thirty-six of the poorer sort are boarded and provided with all necessaries. The provincial court is held every month in the great hall of the city. The bay lies a little above a mile from the city; the inhabitants brew the best beer in Denmark, and carry on so considerable a trade, as to employ thirty-four large ships, besides above a hundred smaller vessels.

The island of Langeland, which is situated in the fifty-fifth degree twenty minutes north latitude, and in the tenth degree fifty-four minutes east longitude, is thirty-three miles in length, but scarce five in breadth. It is very fertile, and under the same general governor as Funen; it contains only the royal prefecture of Tranekiar, which includes the north and south districts, each consisting of seven churches or parishes.

The island of Falster lies at the distance of two leagues from Zealand, in fifty-five degrees north latitude, and is about twenty-eight miles in length, but its breadth towards the north end does not exceed fourteen, and towards the southern extremity is but about four miles broad. It is very fertile, and may be called the orchard of Denmark, from its yielding abundance of fruit: all sorts of game are likewise here in great plenty. This island is commonly the dowry of the queens of Denmark, and consists of one single prefecture, which contains two districts, in one of which are thirteen rural churches, and in the other fifteen.

The principal town in this island is Nicopping, in Latin Nicopia, or Neapolis Danica, situated on the streights called Guldborgfund, in the forty-ninth degree fifty-six minutes north latitude, and is a pretty large, well built town, one of the most ancient in the kingdom; but is not in so flourishing a condition as formerly, when the queen dowager, and other royal personages, constantly resided here. On the land side it is fortified by a wall and ditch. It has a free grammar school, and a well endowed hospital. The royal palace is a great ornament to the town, and is situated very agreeably: the garden is pretty large, and kept in good order. This town carries on a considerable trade.

The island of Laland or Lolland, called by the Danes Laaland, is separated from Falster on the east, by the streights called Guldborgfund, and on every other side is encompassed by the Great Belt and the Baltic. It is nineteen miles distant from the island of Femeren; is thirty-three miles in length, and about fourteen in breadth, and the most fertile spot in the Danish dominions. This island produces plenty of grain, particularly very fine wheat, and excellent peas: it is likewise famous for a kind of red fruit called manna, which in its taste resembles sweet almonds, and grows on a slender stem; it also abounds with apples. It has some woods, but these are more frequent on the east than on the west side of the island. As agriculture turns out greatly to the advantage of the inhabitants, they make little account of grazing. Yet, after all, the country lies low, the soil is damp, and the air very unhealthy. The nobility are here, however, very numerous, and have considerable estates, and very fine seats. This island, like Fal-

ster, has a particular governor; but in spiritual affairs, both are under the bishop of Funen. It contains three prefectures.

The capital of the island is Naskow, in Latin Nascovia, which was anciently well fortified; but is now only encompassed with a wall. It is of a middling size, and handsomely built. The inhabitants are wealthy, and trade in the produce of the country, it having a pretty good harbour. The Jews are allowed the public exercise of their religion, and have a synagogue here: the town has also a grammar school, and an hospital.

S E C T. IX.

Of Jutland in general; with a particular Account of North Jutland, its several Governments, and the principal Places contained in each.

WE now come to the peninsula of Jutland, called by the Danes Judland or Jylland, in Latin Jutia, the ancient Cimbrica Chersonesus. This large peninsula is bounded by the Baltic on the east; by the North-Sea on the north and west; and on the south is separated from Holstein by the Eider and the Lewen. It is computed to extend, from the river Eider to its northern extremity at Cape Skau, two hundred and forty-seven miles in length; and from Bouberg to Nasset, a hundred and fourteen miles in breadth. It is divided into North and South Jutland, the latter of which is called the dutchy of Sleswic, of which we shall give an account in a separate section.

North-Jutland, which is commonly called by the general name of Jutland, is bounded on three sides by the North-Sea and the Baltic; but on the south is divided from South Jutland, or Sleswic, by the rivers Kolding and Skotburg. It extends a hundred and eighty miles in length, and from seventy-one to ninety-five in breadth, and, of all the territories in Denmark, is the largest, and yields the greatest revenue. Indeed the middle part is mostly composed of heaths and moors, which, however, afford good pasture for oxen, sheep, and goats; but the other parts, which are of greater extent, are extremely fertile, as appears from the great quantity of all sorts of grain annually exported to Sweden, Norway, and Holland, and from the great sums received by the inhabitants for their horses, oxen, and hogs. Hence Jutland has been frequently called the Land of Bacon and Rye-Bread. Here is also great plenty of sea and fresh water fish of all kinds; but the largest lakes, in which the most fish are found, are near the palace of Scanderburg. The chief bays and gulfs are on the east side of the peninsula, the principal of which is the gulf Lymfurd, which runs from the Categate, ninety-five miles within land, and gradually widening, forms several islands: it is navigable, and abounds with fish; but though it is of such large extent, it is separated from the sea only by a narrow tract of land. Here are also several other gulfs, which form good harbours. There are a great number of small streams, but the largest river is that of Guden, from which Jutland is said to derive its name; it rising in the government of Arhuse, and after receiving above forty smaller streams; becomes navigable near Randers, and having run a course of about a hundred and nineteen miles, falls into the Categate.

Jutland is every where interspersed with hills, and on the east side has fine woods of oak, fir, beach, birch, and other trees; but the west side being less woody, the inhabitants are obliged to use turf and heath for fuel. Here is also great plenty of all kinds of game. The air is somewhat keen and piercing, especially towards the North-Sea.

The Jutlanders are of a robust constitution and resolute temper, seeming to have raised themselves to a state of freedom superior to that of the other inhabitants of Denmark. Many of the peasants have freeholds, for which they only pay a small acknowledgment to the lord of the manor.

The Danish language is spoke with less purity and elegance here than in the other provinces, and besides, the Jutlanders have a particular accent. Fredericia is

the only place where any religion, besides that of Lutheranism, is tolerated.

North Jutland was formerly divided into nine large districts; but this ancient division is now abolished by the royal courts of judicature, and it is at present composed of four dioceses, or general governments. Each of these has its bishop and general-governor. They derive their names from four chief cities. We shall begin with those that lie most to the north.

The general government of Alburg, or Aalborg, comprehends the most northern part of Jutland, it being divided from the other provinces by the gulf of Lymfurt, and would be an island were it not for the narrow isthmus between the North-Sea and the gulf of Lymfurt. It extends in length something above eighty-five miles, and its greatest breadth is nearly as much. Nature has divided this province into four parts, which are subdivided into a certain number of prefectures.

Albourg, in Latin Alburgum, the capital of this government, is a large, populous, ancient city, and, next to Copenhagen, the most wealthy in the whole kingdom. It stands in latitude fifty-six degrees thirty-five minutes, in a very low situation, and is watered by two rivers called the East and West River, which run through it. It has two parish churches, an hospital with a chapel, a cathedral school, and two alms-houses. An episcopal palace was built here by Christian V. and a royal palace stands near the water-side, where the general governor resides. Here is also an exchange for merchants, and a deep and safe harbour, but its mouth is somewhat difficult. A great quantity of herrings and grain is exported from hence, as also muskets, pistols, saddles, and gloves, for which the city is famous.

The next general government is that of Wibourg, which is bounded on the north by the gulf of Lymfurt; on the east by the Categate; on the south by the governments of Arhuse and Ripen; and on the west by the government of Ripen alone. It is about forty-seven miles in breadth, and fifty-seven in length, and is esteemed the least of the four governments into which North Jutland is divided, it containing only two prefectures, in which are forty-seven manors.

The most considerable place in this government is Wibourg, in Latin Viburgum, the capital of all North Jutland. It stands in the fifty-sixth degree eighteen minutes north latitude, and in the ninth degree twenty minutes east longitude, almost in the center of the country, and is seated on the lake of Asmild, which abounds with fish. This is one of the most ancient cities in the whole kingdom: before the Reformation it contained twelve churches and six convents. It is at present near two miles and a half round, and includes three parish churches, three market-places, six gates, and twenty-eight streets and lanes. The governor-general of the province resides here, and it is a bishop's see. The cathedral was burnt down in the year 1726; but proper measures were immediately taken for rebuilding it. The episcopal, or cathedral school, has six masters, with handsome salaries, and a royal foundation for poor scholars. Here is also a stately edifice, in which the provincial court for all North Jutland is held monthly. In the year 1606, this city was entirely destroyed by fire, and in 1726 the largest and best part of it was a second time burnt; but the damages it then sustained were soon repaired.

The general government of Arhuse, called by the Danes Aarhus, borders on the gulf of Wibourg, and extends about seventy-one miles in length, and from forty to forty-three miles in breadth. This government is, in some respects, preferable to any other in Jutland, and the extraordinary fertility of the soil enables the inhabitants to export annually very large quantities of grain. It is diversified with many woods, several lakes abounding with fish, and commodious bays; and is watered by several rivers and brooks. This government is divided into eight prefectures, the principal places in which are,

Arhuse, Arhusen, in the Danish tongue Aarhus, the capital of the diocese, is situated in the fifty-sixth degree ten minutes north latitude, and lies low in a fine plain between the sea and a lake, and from the latter a stream runs in a pretty wide channel through the city, dividing

it in two unequal parts. It is a large, populous, and much-frequented town, that has six gates, two churches, a chapel of ease, an episcopal palace, a cathedral school, and a well-endowed hospital. The cathedral is a large structure, a hundred and fifty paces long, ninety-six broad, and near forty-five Dutch ells in height. Before the Reformation, here were two monasteries, and one convent of nuns. The provosts of the diocese hold an assembly twice a year in the chapter-house. The harbour, which is at the mouth of the abovementioned channel, is safe and convenient, but is not very large, and sometimes has not a proper depth of water; however, the city carries on a considerable trade.

Scanderbourg is a very ancient palace, situated in a pleasant country, and surrounded on every side with woods and water. The kings of Denmark have, ever since the Christian religion was introduced into the kingdom, resided more or less in this place. In the reign of Frederic IV. the apartments were rendered more commodious; they were embellished with new ornaments, and near this structure a garden was laid out. On one side of this palace is the little town of the same name, the inhabitants of which are chiefly employed in agriculture; and in 1751, some works were set up for refining brown, red, and yellow oker, all which species of earth are very common in Jutland.

The general government of Ripen is bounded on the north by the gulf of Lymfurt, and by the dioceses of Wibourg and Arhuse, with the Little Belt on the east; on the south it joins to the dutchy of Sleswic, a part of which belongs to it; and on the west is washed by the North-Sea. It is a hundred and forty-two miles in length, and fifty-seven in breadth. This is the most extensive, but neither the most fertile nor populous, of the four general governments, into which North Jutland is divided; for it is interspersed with large barren wastes: the soil is, however, very fertile in several parts of the government. The see of Ripen was founded in 946, by the emperor Otho I. who, after a successful war with Harold king of Denmark, prevailed on him to embrace the Christian religion. This province contains four prefectures, the most considerable places in which are,

Fredericia, or Frederica, in the prefecture of Kolding, the most fertile part of the country. This is the only fortified place in all North Jutland. It is a modern town situated on the Little Belt, but though it takes up a large compass, it is far from being full of buildings and inhabitants. It first began to be built in 1651, by Frederic III. but scarce were the fortifications finished, and the town properly inhabited, when the Swedes, in 1657, took it by storm, and burnt a great part of it to the ground. Both the fortifications and the town were repaired at the conclusion of the war, and in 1682, Christian V. granted a charter which rendered Fredericia an asylum for all bankrupts, whether natives or foreigners, and allowed all the Calvinists, Papists, and Jews, who settled here, the free exercise of their religion. The fortifications of this town are in good condition, but are so large in extent, that they would require a numerous garrison to defend them. Here are two Lutheran churches, in one of which the service is alternately performed in the Danish and German languages; a Calvinist church, a popish church, a synagogue, a grammar school, and a good arsenal. A considerable quantity of tobacco is planted both within and without the walls. Here all vessels passing through the streight called the Little Belt, pay a toll.

Kolding, in Latin Coldinga, a small town on the river Trueth, or Kolding, which here discharges itself into a bay that runs about five miles from the Little Belt within land, as far as this town. It lies low between two hills, and is one of the oldest towns in the country. It has one parish church, a rich hospital, with a church belonging to it, and a grammar school: but the harbour being choaked up, is a great disadvantage to its trade. On an eminence to the north-west stands a castle, built in the year 1248, but it was greatly improved by Christian III. Christian IV. and Frederic IV. One of its greatest singularities is the giant's tower, erected by Christian IV. which is flat on the top, with a stone balustrade, and has at each of the four corners, a statue of stone,

stone, seven feet high. This castle has its particular church or chapel. But Kolding is chiefly remarkable for the royal custom-house, which stands over the water on the bridge, in order to receive toll for all foreign commodities that pass through it in carriages, and likewise for the horses and oxen that go into the dutchy of Sleswic. The number of oxen passing this way one year with another is computed at twenty thousand, and two rixdollars are paid for every head.

The city of Ripen, in Latin *Ripæ Cimbricæ*, the capital of the diocese, is situated in the fifty-fifth degree thirty-six minutes north latitude, and in the ninth degree ten minutes east longitude, on the banks of the river Nibs-Aa, and, next to Wibourg, is reckoned the most antient town in North Jutland. It was formerly one of the most celebrated and flourishing cities in the North, it having four parish churches and five chapels, besides the cathedral, four convents with their churches, and between six and seven hundred free burghers. A considerable number of ships then traded from this port to Norway, England, Holland, and France, and the city had the privilege of coining money; but an end was put to this opulence, partly by several dreadful conflagrations, and partly by inundations and the ravages of war. The city and suburb are separated by the river Nibs-Aa, which entirely surrounds the former, and sometimes lays it under water. Here are two churches, besides the cathedral, which is dedicated to the Virgin Mary, and stands on an eminence. It is a large structure, and contains the monuments of king Erick III. and Christopher I. On one side of the choir is the chapter-house, in which the consistory is held: here are also the effigies of all the bishops of Ripen since the Reformation, the first excepted. St. Catharine's church is also a large edifice, said to have been built in the thirteenth century by the Dominican monks, whose convent was contiguous to it. The grammar-school, which is said to have been founded in the year 1298, is the most antient of any in Denmark: it consists of six classes, has seven masters, and a library erected in 1720. The Dominican convent is converted into a commodious hospital, and the old exchange belonging to the merchants into a town-house. Here is still a small trade carried on in grain, horned cattle, and horses; but the shallowness of the river will admit of only small vessels coming up to the city, and these only at high water.

S E C T. X.

Of South Jutland, or the Dutchy of Sleswic: its Situation, Extent, Rivers, Produce, and Inhabitants: with a Description of the principal Towns in that Dutchy, and of the Islands on its Coast.

THE dutchy of Sleswic derives its name from its capital, but is frequently termed in history South Jutland, particularly by antient writers. Some have erroneously annexed it to Holstein, and described it as a part of Germany; but Sleswic is in reality a part of Denmark, and is divided from the dutchy of Holstein, which bounds it on the south, and consequently from the German empire, by the Eider and the Lewen; on the east it is bounded by the Baltic and the rivers Kolding and Skotburg, which separate it from North Jutland; while to the west it is washed by the North Sea. Thus it extends in length from Rendsburg to Koldingen, about eighty-five miles, but its breadth is unequal, it being in some places no more than forty, though in its broadest part it is about sixty-six miles, including the two small islands of Arroë and Helgeland.

There are no high mountains in Sleswic, but only some eminences. The highest hills are near the towns of Sleswic and Apenrade. The chief rivers in this dutchy, most of which flow from east to west, are the Eider already mentioned, as dividing Denmark from Germany; the Treen, which falls into the Eider near Frederickstadt; and the Nips-Aa, which runs close by Ripen, with several smaller streams.

Providence has plentifully supplied this country with corn, cattle, and fish; and some parts of the west side

of Sleswic, lying between the continent and the islands, which are overflowed by the tides, afford a great many oysters.

The inhabitants are a mixture of Danes or Juts, Lower Saxons, and Friesians; besides which there are Hollanders settled in Frederickstadt, and Flemings in Nordstrand: whence in some places the Friesian is the common language, in others the Danish, and in others the German.

Lutheranism is the prevailing religion in this dutchy, except at Frederickstadt, where papists and Jews, besides several sects, are tolerated; and on the island of Nordstrand the Romans have a popish church and a chapel: the Calvinists are also indulged in the exercise of their religion in this dutchy, by an edict issued in 1734; but they are not very numerous.

The nobility of Sleswic have the same privileges with those of Holstein, but are not subject to the same governor; for they acknowledge the king only for their sovereign, and are under the jurisdiction of the royal provincial court at Gottorp.

The whole dutchy is divided into cities, prefectures, districts, parishes, manors, and other smaller divisions. The cities have their particular magistrates, who are entirely independant of the prefects. A governor is president or chief judge in all the towns of the dutchy.

The taxes in the country are sometimes levied by the stewards or clerks of the prefects, and sometimes by the magistrates of the districts, and by them paid to the king's receiver at Rendsburg. In every prefect there is also a steward or administrator, who takes care of the royal revenues, the repairs of the roads, the preservation of the woods, and the like.

The principal places in the dutchy of Sleswic are,

Apenrade, or Abenrade, in the prefecture of the same name, which is one of the best and most flourishing towns in the country, and is continually improving in beauty and extent. It is situated in the fifty-fourth degree fifty-two minutes north latitude, and in the tenth degree seven minutes east longitude, at the bottom of a deep open bay, which runs from the Baltic a good way into the land, and is surrounded on three sides with high mountains. It has a safe and commodious harbour, but not deep enough for ships of burthen to come up close to the bridge. Most of the inhabitants, who are famed for ship-building, are in good circumstances; and though the town has frequently suffered by fire, they, by their industry, have repaired all the damage it has sustained.

In the prefecture of Tundern is the island of Sylt, which is nineteen miles in length, but very unequal in its breadth. The soil is not fertile, nor does it produce either wood or turf, on which account the inhabitants are obliged to supply themselves with fuel from the continent. They subsist chiefly by navigation, agriculture, grazing, and knitting; and are such expert seamen, that the trading towns are glad to employ them on board their ships; but as they are very sensible of their abilities, few will serve as common sailors, but expect the pay as masters or mates. Both sexes are very tenacious of their antient dress. The island contains four parishes, and had formerly an harbour at the north angle, but it is at present quite choaked up with sand.

The islands of Alsen and Arroë contain the prefectures of Sonderburg and Norburg.

The island of Alsen is situated in the Baltic near the continent, and is separated from it by a narrow strait called Alsenfund. This island is about nineteen miles in length, and is about four miles in breadth. It lies under the fifty-fifth degree of north latitude. The soil, which is every where very fertile, yields all kinds of grain except wheat, and plenty of fruit. It has also several fine woods that abound with game, and lakes of fresh water, which afford a variety of fish. In the prefecture of Sonderburg, in the south part of the island, is the town of the same name, which is of a middling size, and stands on the acclivity of a very rugged hill that renders the streets very uneven. This town is lately much improved in its buildings, yet it has but one church, which stands on an eminence almost without the town; and adjoining to it is an alms-house, built out of the ruins of an old convent. The harbour is esteemed one

of the best in Denmark, and most of the inhabitants are mariners. The king's palace, which stands at the entrance of the harbour, is both strong and spacious; it is a quadrangular structure, fortified after the antient manner with round bastions. On the east side of this castle is a round tower, in the lower part of which king Christian II. was imprisoned for twelve years. This castle is the residence of the king's prefect, and has a beautiful chapel.

The island of Aroe, which is at the distance of about three miles from Funen, and about twelve miles to the north-east of Alsén, is about fourteen miles in length, and about three miles in breadth. It was formerly very woody; but has been entirely cleared, in order to render it fit for tillage. It has no deer, but abounds in hares and wild fowl. It has two good harbours, that in the large bay, at the entrance of which two castles formerly stood, one on each side; and that of the little town of Arroes-Kiopping, which is sheltered by the little island of Deyeroe, that lies opposite to the harbour. Here is great plenty of all kinds of vegetables, especially Danish cummin, cabbages, and onions. The inhabitants are a mixture of peasants and sea-faring people. With respect to spiritual affairs, this island is in the diocese of Funen; but, with regard to civil affairs, is included in the duchy of Sleswic; and, by virtue of an edict published in 1750, is under a particular court of judicature.

Flensburg is in the prefecture of the same name on the continent, and is a pretty large well-built town. It has a low situation, and is surrounded on three sides by mountains, and on the fourth lies the famous gulph called Flensburgerwieck, which runs ninety-five miles from the Baltic into the land. The hills on both sides of the gulph form a secure harbour, with a depth of water sufficient for the largest ships, which are at present unloaded at the quay; but this was formerly done close to the warehouses. At that time the trade of this town was very considerable, but it is at present greatly decayed, for the commerce of the Flensburghers to Norway has been clogged with great difficulties, and that to Copenhagen and other parts of Denmark entirely lost, they being prohibited from exporting thither any silk, cloths, woollen stuffs, wines, and brandy. Flensburg is a long narrow town, extending above four miles in length from the north gate to St. John's gate: it has twelve lanes, besides the high street, and six gates; and is divided into twenty-two quarters. Most of the houses are spacious and strongly built. Here are three German parish churches, one Danish church, an orphan-house, and a good school; also an alms-house, with a chapel, that was formerly a convent of Grey Friars, and in which fifty poor persons are comfortably maintained. By the water-side is a warehouse for merchants. The north and south market-places are both spacious, and the latter adorned with a fountain. With St. John's gate is a pleasant suburb facing the harbour called St. Jurgen, the greatest part of which belongs to the alms-houses.

The castle of Gottorp, or Gottorf, stands in the midst of a small lake, and is built in the form of an oblong square. Some derive its name from Gotteldorf, or God's village, it originally belonging to the bishops of Sleswic, and was appropriated to a pious use. A rampart encompasses the first court, and the gate of the castle is of a fine blue stone as hard as marble. On the north side of this structure is a bridge over the lake two hundred paces in length, at the end of which a pleasant walk, between rows of trees, leads to a fine garden, adorned with cascades, fountains, and other water-works; particularly in a large basin is a statue of Hercules combating the hydra, whose seven heads spout water. On the north is a parterre in the form of a crescent, divided into compartments, and embellished with the busts of several kings and princes. Before the house is a level piece of ground, about a hundred and fifty paces long, divided into three parts; those on the sides being two fine parterres, and that in the middle having a large basin in the center, with fine water-works. From thence you ascend to different terraces, one above another, set round with statues, busts, and other ornaments. The highest terrace exhibits a most delightful prospect of the castle, the surrounding lake, and a fine country; and, on the other

hand, of a noble orangery, and the neighbouring park, which is four or five miles in circuit, and well stocked with deer.

Sleswic, or Schleswig, in Latin Slesvicum, is the capital of the duchy, and is supposed to derive its name from the Wiecke, or gulph of Schley. It is situated in a most delightful country, in the fifty-fourth degree fifty-one minutes north latitude, and in the ninth degree fifty minutes east longitude. Its form is very irregular, but has some resemblance to a crescent, and is about half a Danish mile in length. The city is divided into three parts, Old Sleswic, Lollfuss, which is a long street leading from the town to the castle of Gottorp just described, and Fredericburg, formerly called Kratzenberg, which lies at the south extremity of the town. In the Old Town is only one church, which is the cathedral, dedicated to St. Peter. This is a grand structure, that makes a good appearance both within and without. It has however no steeple, though a very noble foundation of hewn stone has been laid for one. Not far from the cathedral is the orphan-house, which was founded in the year 1714; and in the great market-place stand the town house and the Grey Friars convent. On the north side of the city on St. Michael's hill stands a church called by the name of that saint; and in Fredericburg is Trinity church. On the east side of the city, on the other side of the Fish-bridge, lies the Holm, as it is called, where stands the famous convent of St. John, which was founded for ladies of noble families, and ten nuns, including the abbess, now reside in it. This city has been several times pillaged, burnt, and razed to the ground; and in 1447 was entirely destroyed by fire. It was, however, a flourishing town after all these misfortunes, till the year 1713, when the ducal court being removed from Sleswic, it fell to decay; and though the governor and the state officers still reside there, these advantages are not an equivalent for the above loss; nor is it capable of carrying on any great foreign trade. The mouth of the Sley being choaked up, at present many houses in the city are uninhabited.

Fredericstادت is not a large, though it is a regular and well-built town, of a square form, situated between the rivers Eider and Treen. Its streets are kept very clean, and in some of them are planted fine rows of lime trees. Some Dutch Arminians, who quitted Holland immediately after the synod of Dort, founded this town, and called their settlement by the name of Frederick IV. who was then duke of Sleswic. Half of the magistracy is of the Arminian, and the other half of the Lutheran persuasion: the Calvinists also assemble in the Arminian church; but the most substantial traders and merchants in this town are Mennonites. Here are also some Quakers and Jews, who have a synagogue in the town. The inhabitants subsist by silk and woollen manufactures, navigation, and commerce. Instead of a wall Fredericstادت is encompassed by a moat, with large trees growing on its banks.

The island of Femeren, Femern, or Femarn, in Latin Imbria, Fimbria, or Cimbria-parva, lies in the Baltic, near the coast of Germany, in the fifty-fourth degree fifty-six minutes north latitude, and in the eleventh degree twelve minutes east longitude, and is separated from Holstein by the narrow freights called Femern-sound. It is generally computed to be about fifteen miles in length, its breadth is something above six miles, and its circumference about forty-eight. The soil is in general very fertile, and yields plentiful crops of wheat, barley, and peas; but affords no other game besides hares. The greatest inconvenience this island labours under is the scarcity of springs and rivulets; for in dry summers the inhabitants are extremely distressed for want of fresh water. There are about forty villages in this island, of which Denschendorf is of the largest extent; but Lemkendorf is the best peopled. This island has suffered extremely by the devastations of war, particularly in 1419, when it was ravaged with the most inhuman barbarity by king Erick, of Pomerania, and most of the inhabitants put to the sword. Femern at present belongs to the king of Denmark; but whether it be comprehended in the duchy of Sleswic, or has been always a distinct territory, is disputed.

The

The island of Helgeland, also called Heiligland, is situated in the North Sea, in the fifty-fourth degree twenty-eight minutes latitude, about thirty-six miles from the mouth of the Elbe, and at the same distance from that of the Eider. This island has been several times greatly damaged by being overflowed by the sea, and even a considerable part of it has been long swallowed up by the waves; but the last inundation, which happened in 1649, left only a small part of the island remaining; the basis of which is a solid rock that appears round it, the soil being there washed away by the sea. This little spot has, however, two districts, the high land and the downs, and each of them its sub-divisions. The whole circuit of the high land is about nine hundred and forty rods, and the downs are nearly of the same circumference. The soil in the high land is red, and rather clayey than sandy, and from two and a half to four feet in depth; yet its fertility is greater than one would imagine, for it produces barley and oats, though not a sufficient quantity for the subsistence of the inhabitants. Here are very few trees, except some cherry trees and raspberry bushes; nor are there many vegetables, for the inhabitants cannot spare time to cultivate them, they being very cheaply supplied with all kinds of vegetables and fruit from Hamburg and other places. The high lands have pasture sufficient for no more than about sixty cows, and as many sheep on the highest part. The Hamburgers have erected a light-house, which is supplied at their expence with pit-coal; the descent is very steep, but is made so easy by about a hundred and eighty steps, that a bullock may be driven up and down. The low land is secured by a mole, to prevent its being

entirely destroyed by the sea. Since the year 1727 the downs have been separated by a channel, which is three quarters of a mile in breadth, and of a sufficient depth for pretty large vessels. The Helgelanders are descended from the ancient Friesians, and have their particular laws and manners, still retaining their Friesian names and customs, and never removing to settle in any other country. Their chief food is fish, and a kind of gruel thickened with oatmeal; and their constant employment at sea renders them exceeding hardy and intrepid in all weathers. Their number amounts to about two thousand; while the men are employed at sea, the women are no less diligent and industrious on shore: for as there is neither plough, carriage, nor horse on the whole island, the women dig the land, and sow, harrow, reap, thresh the corn, and grind it with hand-mills; and, besides these laborious employments, are indefatigable in performing all other domestic business. The species of fish caught by the inhabitants about this island, and disposed of at Hamburg, Bremen, and other places, are cod, haddock, ling, several kinds of flat fish, mackerel, thorn-back, whittings, lobsters, &c. and the inhabitants being very skilful pilots, are hired to conduct ships bound to the Elbe, Weser, and Eider, for which they are generally well rewarded; but one-tenth of their profit and some other duties are payable to the king: this island was annexed to the crown of Denmark in the year 1714.

We shall now return to the south of Europe, and visit the countries to the west of Poland, and beginning with Hungary and Transylvania, &c. shall proceed to the German empire.

C H A P. VIII.

OF HUNGARY, including HUNGARY PROPER, TRANSYLVANIA, SCLAVONIA, CROATIA, and DALMATIA.

S E C T. I.

Its Names, Boundaries, and Extent. Its Climate, Mountains, Plains, Lakes, Rivers, Minerals, and Fossils; Plants, and Animals.

HUNGARY, the ancient Pannonia, received its present name from the Hungarians, a race of the Huns, a Scythian or Tartar nation, who in the ninth century took possession of the country; but the Hungarians themselves call it Magyar Orszag: the Slavonians give it the name of Wergierska; by the Germans it is called Ungern, and Hungerland; and by the Italians Ungharia.

The name of Hungary is used both in a limited and extensive sense. In the former, this country is bounded on the south by Servia and the river Drave, which separates it from Slavonia; on the east by Walachia and Transylvania; on the north by the Carpathian mountains, which separate it from Poland; and on the west by Moravia, Austria, and Stiria. But in its more extensive sense it comprehends Slavonia, Dalmatia, Bosnia, Servia, and Transylvania, lying between the forty-fourth degree forty minutes and the forty-ninth degree north latitude, and between the sixteenth and twenty-fifth degree fifty minutes east longitude from London.

The air of Hungary is very unhealthy, especially to foreigners; which is generally thought to proceed in a great measure from the sudden alteration of the weather; the days being excessive hot in summer, and the nights intolerably cold; whence it has been called the Church-yard of the Germans, from the great mortality which usually happens among the German forces when they take the field. The noxious vapours which arise from the many swamps and morasses, are also considered as

another great cause of this unhealthfulness; but these noxious exhalations are less common in the mountainous and more barren parts than in the south.

The chief mountains of Hungary are the Crapac, or the Carpathian: these at the foot are overgrown with common trees, higher up with very large ones, and at a greater interval, which forms as it were a third region, with brush wood: the summit is a chaos of frightful crags and precipices, continually covered with snow, and lakes of very transparent water lying between them.

However, the inner part of the country is far from being mountainous; for the land along the Danube, from Presburg to Belgrade, is almost one continued plain, of near three hundred miles in length: there are besides many other large and fruitful plains in Hungary, very little of it being taken up with mountains and woods.

Though this country lies at a distance from the sea, it is well watered by lakes and rivers. The most considerable of the former are the lake Balaton, or Plattenfee, which is about forty miles in length, and lies on the west side of Hungary, between the Drave and the Danube; and the New Siedlersee, or Lacus Peisonius, which is about twenty-eight miles in length.

The principal rivers of Hungary are, first, the Danube, which rising in Swabia, runs eastward through Germany, Hungary, and Turkey, after receiving sixty navigable rivers, and above a hundred and twenty in the whole, discharges itself by several mouths with such violence into the Black Sea, that both the stream and water are perceptible in it for several miles distance.

The Drave, which issues out of Stiria, separates Hungary and Slavonia, and at last falls into the Danube, near the tower of Darda.

The Teys, or Tibiscus, which rises in the Carpathian mountains, and, while among them, has a rapid and clear

clear stream; but afterwards becomes flow and turbid. It receives several smaller rivers, and falls into the Danube at a considerable distance above Belgrade. No river in Europe equals this in plenty of fish.

The Araba, or Raab, which rising in Stiria, enters the west side of Hungary, and falls into the Danube near Raab.

The Gran, or Granus, which rises in the Carpathian mountains, and running to the southward, falls into the Danube near the city of Gran.

The Wag, which also rises in the north of Hungary, and discharges itself into the Danube a little above Comorra.

Most of these rivers are well stocked with fish, which in some parts of Hungary are so plentiful that they feed their hogs with them, and in other places it is said that a thousand carps have been bought for the value of a crown.

This country abounds also with many salutary hot baths, and several springs that have very uncommon qualities; among which is a spring of vitriol-water, near Shmolnitz, which in a short time gives the appearance of copper to plates of iron; and there are others of so poisonous a nature, that an animal's drinking of them is followed by immediate death.

With respect to the minerals of this country, it is observable that pure gold ore is never found in the mines, though they yield gold ore with a mixture of silver or lead; and on the other hand, no silver is dug up here that does not contain some gold. A quintal of the richest ore, according to Mr. Keyser, yields thirty-five ounces of silver; but some is refined, especially at Cremnitz, that does not yield above two ounces out of a hundred weight, but the ore that yields the least silver generally produces the most gold. There are also mines of copper, vitriol, iron, lead, quicksilver, antimony, cinabar, yellow orpiment, sulphur, marcasite, rock-salt, salt-petre, magnets, asbestos, and gems, though the latter are very different from the oriental; with alabaster, and quarries of marble.

The southern part of this country is so delightful, that a traveller has said of it, "Out of Hungary there is no living, or if there be living it is not life."

The level country produces esculent plants, tobacco, saffron, asparagus, melons, hops, corn, pulse, millet, delicious wine, and a great variety of fruits.

The animals of Hungary are chiefly fine horses, mostly mouse-coloured, and of which incredible numbers are exported; mules, asses, buffaloes, cows, sheep, goats, swine, and many species of wild beasts, deer, chamois-goats, wild boars, bears, wolves, and lynxes.

Besides the sheep common in most countries, Hungary affords a particular species, that have large twisted horns, generally about two feet in length. These are kept in separate flocks, and great numbers of them are annually sent to Vienna.

Among the birds are pheasants, partridges, woodcocks, &c. The number of the wild fowl is, indeed, incredible; and it is not uncommon, in such flocks, for some of them to live to a good old age.

S E C T. II.

Of the different Origin of the Inhabitants: their Languages, Persons, Dress, and Manner of Travelling: their Exports, Imports, and Coin.

THE inhabitants are of different origin. The true Hungarians, as we have already intimated, are the descendants of that fierce people called by the same name, who, by force of arms, seated themselves here in the year 888; and these, though more civil than their ancestors, still shew some traces of their Scythian extraction. Another part of the inhabitants are of the Slavonian race, and this includes the Bohemians, Croats, Servians, Rascians, and Vandals, who inhabit the east and northern parts of Hungary. These, indeed, are found all over the country, and seem to have been settled here from the remotest antiquity. The German nations are the Austrians, Stirians, Bavarians, Franks, Swa-

bians, and Saxons, who seem to have entered Hungary much about the time when the Saxons seated themselves in Transylvania; but war, commerce, and the fruitfulness of the country, have drawn hither other Germans, who have considerably increased since Hungary became subject to the house of Austria. The Walachians, who inhabit the country next to Transylvania and Walachia, seem to be the descendants of the Romans that settled in Dacia. Among the foreigners are the Greeks, who removed hither for the sake of a more advantageous commerce; the Jews, who were formerly much more numerous than they are at present; the Turks and Zingari, who are a wandering people of very uncertain origin; many of these are smiths and musicians. Thus the inhabitants must have been anciently of different dispositions, though, by frequent intercourse, they now resemble each other. They are, for the most part, of a sanguine choleric temper; the nobility are numerous, and both in their dress and tables are fond of pomp and magnificence, yet apply themselves to learning and rural improvements, but more to war, hunting, and martial exercises.

There are four common languages in Hungary; the Hungarian, which is of Scythian origin, without the least affinity to any of the European tongues, and one unvaried dialect. The Hungarians, in writing, use the Roman characters; but the German has its different dialects according to the different nations of Germans settled here. The Slavonian, which derives its origin from the Sarmatian, is divided into the Bohemian, Croatian, Vandalian, Rascian, and Russian dialects. The Walachian tongue is allied to the Italian, and formed by a mixture of Latin and Slavonic. The Latin is not only spoken by the literati and gentry, but also by the commonalty. The Zingarians have a speech composed of a corruption of the Hungarian, Slavonic, Walachian, and other languages.

The Hungarians are well proportioned, of a good stature, and have tolerable complexions. On their heads they wear fur caps, and they have close-bodied coats girt about them with a sash, over which they wear a kind of cloak or mantle, that comes no lower than the hips, and is so contrived as to buckle under one arm, that the right hand may be always at liberty. The colours they most affect in their cloaths are red, green, and blue, the latter of which is most common. The men shave their beards, but leave whiskers on the upper lip; and besides a broad sword, the usual arms of an Hungarian are, an iron mace with a round head, and a kind of hatchet. The young gentlemen have frequently feathers in their caps.

The Hungarian ladies are much handsomer than those of Austria; and the beauties of Vienna chiefly come from this country. They are generally very fair and well shaped, and their dress extremely becoming. The lady Wortley Montague describes one of these ladies, as in a gown of scarlet velvet, lined and faced with sables, and made exact to her shape, the skirt falling to her feet. The sleeves are straight to their arms, and the stays buttoned before with two rows of little buttons of gold, pearl, or diamonds. On their heads they wear a tassel of gold, that hangs low on one side, lined with sables, or some other fine fur; and their behaviour is extremely polite and agreeable.

The women's dress in the mine-towns is not unbecoming; they wear knots of ribbons on their shift sleeves, and others hanging down their backs, but the peasants and lower sort of people dress very meanly. Among the latter, the men are very fond of wearing a furred mantle, and their dress is generally no more than a plain sheep's skin, with a cap and boots of the same. Most of the women have boots, and many of them a long furred gown: they have a kind of shifts of very coarse linen next their skin, with a girdle round it at the waist; and their head-dress is a piece of white linen with two lappets hanging down behind.

In the towns of Hungary the entertainment travellers meet with is not to be found fault with; but in the country it is frequently so bad, that besides the want of good provisions, there is scarce straw to lie upon; and where beds are to be had, they are so short, that one would

think

think the Hungarians slept in the posture in which they ride. They generally keep hogs, of which they make bacon, which is the common food of the Hungarian peasants. The hogs, geese, and fowls, live in the same apartment with their owners.

As Hungary is plentifully watered with fine rivers, the usual way of travelling in summer is by water; and where they have not this convenience, an open chariot drawn by two, three, or four horses a-breast, carries the traveller with great expedition over this flat country. As the air is extremely cold in winter, notwithstanding its southern situation, travellers in that season have a coach fixed upon a sledge, which is drawn by horses with great expedition over the ice and snow. They have a very fleet breed of horses for riding, and never dock the tails, which are considered as a great ornament. Where the roads lie through the woods, travellers are in danger from the wild beasts, and especially the wolves, which in some places are very numerous.

The most common distempers in Hungary are the gout, in its several species, and the fever; the last of which is even called the Hungarian sickness. The first symptoms of this disease in Hungary are nodes or tubercles on the hands and arms, which if rubbed in time with vinegar, salt, and garlic, till they disappear, an end is put to the progress of the disease. The plague also comes from Turkey, and here spreads its contagion.

The burghers follow arts, manufactures, and trade, but the last is almost entirely engrossed by the Greeks. From Hungary is exported excellent wine, and particularly tokay, saffron, oil, metals, minerals, cattle, leather, wool, tallow, and wax; and its imports are spices, tin, silk, velvets, cloths, and other foreign goods.

The pieces of coin current in Hungary, are, a heller, which in Upper Hungary goes for the sixth part of a grosch, and in Lower Hungary for the fifth; a groschel, the fourth part of a grosch; a kreutzer (a German coin) the third part of a grosch, and the sixtieth of a Spanish gulden; the pulgrotz, half a grosch, and the fortieth of a gulden; the siebner, worth seven kreutzers; a siebentehner, worth seventeen kreutzers; a half gulden, worth two shillings and four-pence, English; an ungrisch gulden, worth seventeen groschen and a half; a Rhenish gulden, worth twenty groschen, which, in Upper Hungary, are worth a hundred and twenty, and in Lower Hungary, a hundred ungrisch; a thaler is equal to two Rhenish guildens; the ducats are of two sorts, the Cremnitz ducat is worth four guilders four groschen, but a Transylvanian goes only for three guilders, each guilder worth two shillings and four-pence, English.

S E C T. III.

Of the Religion and Learning of the Hungarians.

THE Christian religion was first established in Hungary in the tenth century, when, in the year 969, or 975, Geyza, prince of the country, was baptized; and this religion made great progress under his son and successor Stephen, whose zeal gained him the title of apostle and saint.

In 1523, the Reformation began by Martin Cyriacus first preaching the doctrine of the gospel in this country; but it had before made its way into Transylvania. From that time great numbers of Hungarians went to study in Germany, and at their return were considered as the disciples of Luther. Soon after the opinions of Zuinglius, in relation to the sacrament, were made known in Hungary, and a little after the sentiments of Calvin were embraced by great numbers. But from the time Hungary became subject to the house of Austria, and the Jesuits got footing in that kingdom, the protestants underwent many severe trials; especially in the beginning of the seventeenth century. Under Ferdinand III. the protestants were deprived of several churches, and of more under the emperor Leopold, in whose time it was enacted at the diet of Sopron, or Oldenburg, that the reformed should not possess more than two churches in each palatinate. Nor could their enemies rest here till they had driven them out of all the churches that had not been

expressly mentioned in the twenty-sixth article of the diet of Sopron, and accordingly above three hundred were actually taken from them. The Vandals too had six churches, and now are without so much as one place where divine worship is performed in their own language.

Mr. Keyssler observes, that six or seven thousand of the inhabitants of Schemnitz, which constitute two-thirds of the city, profess Lutheranism, and yet the magistrates are always Romans; but at Cremnitz the magistracy is shared between the two religions, though no protestant is capable of employment in the imperial mines. In Upper Hungary he says the Lutherans are very numerous, especially in the country, and yet in some places they are forcibly driven into the Romish churches like so many sheep; but at Pilsen, which is not far from Schemnitz, the popish clergy and the protestant inhabitants are so conformable, that the priests read mass in the churches belonging to the protestants, and these in their turn sing Lutheran hymns in the Romish churches.

It is worthy of remark, that the protestants have generally more churches allowed them in those countries that remain under the dominion of the Turks, than where they are subject to the emperor; for on paying the tribute imposed on them, every one enjoys his own religion without molestation. Though the Romans scarcely constitute one-fourth of the inhabitants of Hungary in general, and do not pay above one-sixth part of the taxes, they are incessantly contriving to impose new grievances on the rest of their countrymen. The protestants are not possessed of a single printing-press, either in Hungary or Transylvania; besides, the importation of Bibles, and all books relating to the doctrinal points of their religion, are strictly prohibited; and before an Hungarian student is permitted to go to a foreign university, he must obtain a licence, or passport, from the Imperial governor of the country. Their schools are confined to the syntax, and no teachers of the sciences allowed among them; except their being indulged since the year 1751 with a college at Oedenburg, and a seminary at Eperes.

At the head of the Romish church are two archbishops and nine bishops, nominated by the queen, and confirmed by the pope. In Dalmatia, Croatia, and Slavonia, none but the papists are qualified to hold lands. The Rascians, Russians, and Walachians, profess the Greek church, which has been tolerated since the year 1690, by the emperor Leopold and other kings. The Baptists and Mennonists are chiefly settled in the neighbourhood of Presburgh; but the Jews are dispersed in most of the considerable towns, though under the burthen of paying double taxes of all kinds.

Learning among the Romans is principally cultivated by the Jesuits, who in the universities of Tirnau, Buda, Raab, and Caschau, are the professors of divinity, philosophy, mathematics, rhetoric, and other sciences, which they also teach in several colleges: but the *patres piarum scholarum* only teach polite literature. The Benedictines, Paulines, and other orders of monks apply themselves after their manner to learning in their several convents. The Lutherans and Calvinists, after having laid the foundation of the sciences in their schools, go, if they can obtain a licence for that purpose, to the universities in Germany, Holland, and Switzerland: but very narrow bounds have been lately prescribed to their studies. The Christians of the Greek church also begin to shew a greater inclination to learning than formerly. The law was antiently taught only in private; but at present there is a public professor appointed for it in the university of Tirnau, and even a particular college erected for that purpose at Erlau.

S E C T. IV.

The History of the Hungarians; the Manner in which their Kings were crowned; the Arms of Hungary; the States of the Kingdom; the public Offices, Forces, and Courts of Justice.

WE shall here give a concise view of the history of this country. It appears that its antient western inhabitants were called Pannonians, and the northern Jazygians.

Jazygians: but the Romans, having reduced Pannonia, kept it almost four hundred years, till in the fourth century the Vandals drove them out of it, and held it forty years; but in 395, when they advanced towards Gaul, the Goths took possession of their settlement; but these were also, in their turn, obliged to resign their new possessions to the Huns, who had likewise driven them from their antient habitations.

In the year 888, the Huns, under the name of Hungarians, made a second irruption into Pannonia, as auxiliaries to Arnulph emperor of the West, and Leo emperor of the East, against the Bulgarians and Sclavonians, whom they reduced. They had seven commanders, and both Germany and Italy afterwards felt the terrible effects of their ferocity; but by degrees their manners became more civilized, especially towards the latter end of the tenth century, when Geyza, their prince, embraced the Christian religion, and his son Stephen, in 997, became the first king of Hungary, and, as hath been already observed, completed the establishment of that religion, annexed Transylvania as a province to Hungary, and after his death was canonized. After him followed a succession of twenty kings, natives of the country, the last of whom was Andrew III. who died in the year 1301. On this followed a succession of twelve foreign kings, the last of whom, who was Lewis II. fell in an unsuccessful battle against the Turks. The kingdom next devolved to the house of Austria, under whom arose a most bloody intestine war, which lasted for a long time, in which the country was equally ravaged by the Turks and Austrians. In 1687 Hungary became an hereditary kingdom to the archducal house of Austria; and it was agreed at the diet in 1722, that in case of failure of male heirs, the princesses should also succeed. Accordingly the emperor Charles VI. dying in the year 1740, his eldest daughter Maria Theresa ascended the throne, and was crowned in 1741. Her majesty is conformed to the present emperor Francis Stephen, whom the states of the kingdom, in 1741, also invested with the joint sovereignty.

A late author observes, that the Hungarians have contended with their princes about their rights and privileges, till the Imperial eagle has decided the controversy by devouring both, and left them only the shadow of their antient constitution; and that their states or diet assemble like the parliament of France, for form sake, or rather to record the arbitrary decrees of the emperor, and by signing their consent to them, take off the odium of every destructive scheme from the court, and place it on themselves: by which means their chains are probably now so firmly riveted, that their slavery will be everlasting, unless another family should be elected to the Imperial crown.

At the coronation of the Hungarian kings, the people antiently assembled in a plain called Rackes, near Pest, where the bishops, the nobility, and the representatives of the several counties and cities, having unanimously approved of the person proposed for their king, who was usually the next in succession; he was conducted to Stuhlweissenburg, or Alba Regalis, where he was presented to the people by the palatine, who demanded three times whether they approved of the new elected king? and they having expressed their consent, he put a drawn sword into the hand of the new king, who brandished it towards the east, west, north, and south. He was then attended to the great church, where the archbishop of Gran holding the royal robes in his hand, asked the people if they were satisfied with the king elect, and were willing to become his subjects; and receiving an answer in the affirmative, he proceeded to perform the usual rites observed at the coronation of their kings; after which the prelates and nobility carried the arms and other relics of king Stephen I. before the new king in a splendid procession to the palace. The crown of Stephen is still preserved at Presburg with great veneration, and no prince is allowed to be duly crowned with any other: the Hungarians in general believing that the fate of their nation depends on their carefully preserving it, and therefore in all their calamities they have taken care to convey it to a place of safety; nor have the Turks been less solli-

citous to make themselves masters of it, from the opinion that the Hungarians would make no scruple of paying their allegiance to the grand seignior, could he but once cause king Stephen's crown to be placed on his head.

The kings of Hungary are by the laws styled catholic and apostolic, on account of the zeal which Stephen I. shewed in the conversion of the Hungarians. The regalia, which consist of the golden crown, made in the eleventh century, the sceptre, king Stephen's sword and mantle, gloves and shoes, with the silver cross, the mark of his apostolic function, are kept in the castle of Presburg; and in that city is still performed the coronation of the king by the archbishop of Gran.

The arms of the kingdom are, a shield longitudinally divided; the right field gules, divided by four bars argent. The left quarter is also gules, with an archiepiscopal cross argent, standing on a triple hill vert.

The states of Hungary are divided into four classes.

To the first belong the prelates, who direct all religious matters, and precede all other persons, except the governor of the kingdom, who gives place only to the archbishop of Gran. These are the archbishops of Gran and Kolocza; the former is primate of Hungary, chief secretary and chancellor legate of the papal see, and prince of the holy Roman empire. He alone crowns the king or queen, is perpetual count of the Gespanchaft, or county of Gran, creates even noblemen, and never takes an oath himself, but his official swears in his stead. Under him are the six bishops of Erlau, Nitra, Raab, Vatz, Funfkirchen, and Veszprim; to whom may also be added the Greek bishops of Buda and Muncatz, who are united to the Roman church. Next to him is the archbishop of Kolocza, with the following suffragans: the bishop of Bats, which is however annexed to the archbishopric of Great Waradin, Csanad, Zagrab, Sirmia, Bosnia, Transylvania, and Bakow in Walachia. These bishops have a double character, and all of them, except the bishop of Bats, are perpetual counts of the counties in which they reside, and have also a seat in the diet. Besides these are the abbots, who are ten in number, and nine probsts.

To the second class belongs the magnates, or barons, the principal of whom are the great barons of the kingdom, who also hold the chief offices: these are the palatine, who is the principal, and in many cases acts as sovereign; the court judge; the ban or viceroy of Dalmatia, Croatia, and Slavonia; the governor of Transylvania; the treasurer; the great cup-bearer; the steward of the household; the master of the horse; the lord-chamberlain; the captain of the yeomen of the guards; and the grand marshal of the court. To these may be added, the inferior ban, or counts, and barons.

To the third class belong the gentry, some of whom have noble manors, and others only the privileges of nobles.

To the fourth class belong the royal free cities, which are summoned to the diet, and are not subject to the counts, but hold immediately of the king, and have a council of their own, in which a city judge and burgo-master usually preside.

The diet is summoned by writ from the sovereign every three years, to meet whenever his majesty's service or the public welfare require it. Accordingly on the day appointed the lords spiritual and temporal personally appear in the chamber of the magistrates; but the towns and gentry send two deputies, who meet in the states-chamber. The states lay their representations before the king or queen, who also refers to them such articles of public concern as require their assent.

The public offices by which the government is administered are the following:

The Hungary office, which is at Vienna, and has a secretary of state at its head. This office expedites the royal edicts in municipal, religious, and judicial affairs for Hungary, and the incorporated kingdoms of Croatia, Dalmatia, and Slavonia. To this office belong all matters relating to the king, and wholly dependent on his pleasure. All who stand in need of a personal audience

dience of the queen, must first acquaint this office with it. In other respects it has very little connection with the kingdom, its principal business being to execute the sovereign's pleasure.

The stadtholder's or governors council resides at Presburg, and, besides the governor, who is president, consists of twenty-two counsellors, whom the king chooses at pleasure from among the prelates, nobility, and gentry. In Hungary and the incorporated countries it superintends the civil concerns of the towns as regulated by the laws of the land. It is subject to no other office; but when it has any thing to lay before the king applies immediately to his majesty.

The royal exchequer is divided into the Hungarian and mine-chambers, and takes care of the royal estates, incomes, and dues. This exchequer is held at Presburg, and has a president and eighteen counsellors. Under it is the office at Caschau, besides eight provincial commissaries for collecting the contributions. The mine-chamber is held at Cremnitz, and manages all affairs belonging to mines and coinage. It receives orders from the treasury at Vienna; and under it are the mine-chambers of Schemnitz, Neusohl in the *gespanschaft* of Zip, and at Konigsberg.

The public revenues consist of contributions, customs, mines, salt-works belonging to the crown royal domains, and escheats, which abundantly answer the expences of the court and defence of the frontiers.

The kingdom of Hungary can easily raise an army of a hundred thousand men, keeping fifty thousand in pay, and the provinces furnishing the same number. Their horse are denominated hussars; these are extremely expert horsemen. They use very short stirrups, and sitting with their knees high, rise up when they make a stroke with their scimitars, to give the greater force to their blows. Their horses are fleet and well managed, but too small; and in a regular engagement are far inferior to the English horse, whose weight alone will bear them down.

Their foot are denominated heyducs, or foot hussars; these brandishing their naked swords, put themselves into a hundred terrible postures, advancing, retreating, turning, and winding about with great activity, singing all the while.

Justice is administered in civil affairs in the name of the sovereign, after the manner prescribed by the laws and customs of the kingdom. Suits are carried from the courts of the smaller towns, either to the court of the *gespanschaft*, or county, when it is a free town, or to the lord of the manor when it belongs to any particular lordship. In the royal free cities the first hearing is before the judge of the town, the second before the council, from which there is an appeal to the treasurer. The mine-court in the free mine towns is distinct from the town court, and takes cognizance of only such affairs as relate to the mines: the mine judge presides, but an appeal lies from him to the commission-court of the mine towns.

Inferior noble courts are held by the lord of the manor in each county for determining causes relating to the commonalty, and where noblemen are concerned, by the court judges or judge of the nobles, and the vice-*gespan*; but a cause may be carried from these to the county court, and afterwards to the *Tabula regia* and *septemviralis*. The middle noble court meets at Tirnau, Guntz, Eperies, and Depretzen, and has the trial of all causes in which two or more counties are concerned, and may from thence be removed to the *Tabula regia* and *septemviralis*. The upper noble court, which resides at Pest, is divided into the *Tabula regia* and the *Tabula septemviralis*, and not only decides causes brought hither by appeal, but also other important suits relating to the nobility. In the first presides the king's representative; in the second the count palatine, or, in his absence, either the court judge or the treasurer. The *Tabula septemviralis* is thus called from its formerly consisting of seven persons; but Charles VI. made an addition of eight more. It takes cognizance only of such causes as are referred to it from the *Tabula regia* examining them, and making the necessary amendments.

S E C T. V.

Of the Divisions of Hungary, with a particular Account of Upper Hungary, a Description of a remarkable Cavern, and of the principal Towns of that Division.

HUNGARY Proper is divided into Upper and Lower Hungary; here some give the name of Upper Hungary to that part which lies between the Danube and Poland, and call that which lies below the Danube Lower Hungary; while others drawing a line from the county of Lip, to the junction of the Banat of Tameswaer, and the county of Sirmi, call that part which lies to the east of the line Upper Hungary, and that towards the west Lower Hungary. With respect to its government by the great juridical courts, it is divided into four large circles, and fifty-two *gespanschafts*, or counties, called by the Hungarians *varmegye*. These counties are small provinces under counts, viscounts, and assessors, who in the name of the sovereign hold provincial assemblies or diets.

We shall begin with Upper Hungary, which forms the east part of the kingdom, and borders on Poland, Transylvania, and Walachia; consisting of two circles, that on this side the Teisse, and that on the farther side of that river. The former of these circles contains eleven counties, and is inhabited by Hungarians, Bohemians, Slavonians, Germans, and Russians.

The county of Sips is almost every where woody and mountainous, but is interspersed, especially towards the middle, with delightful plains, fruitful fields, pastures, and rivers that abound in fish. The Carpathian mountains are here at their greatest height: here are also several other remarkable mountains, among which are the Ochsenberg and the Konigsberg, or King's mountain, so called from king Matthias Corvinus, who in 1474 dined on its summit.

From these mountains issue the following rivers: the Popper, which runs from the lake of the same name in the western part of the Carpathian mountains, and runs into the Dunavetz. This last river rises in the northern summits of the Carpathian mountains, and at last discharges itself into the Vistula. The Kundert, or Hernat, springs at the foot of Konigsberg, and runs into the Teisse. The Golnitz, which has its source in the mountain named Ochsenberg, and also falls into the former. Besides these there are several rivers of less note.

The air is here cold, but very healthy; and though no wine be produced in this country, it abounds with corn, particularly wheat, barley, and peas; and the inhabitants raise flax.

The wild beasts here are lynxes, bears, wild boars, wolves, foxes, stags, hares, chamois, and marmottes.

The inhabitants are not fond of mining, agriculture turning out more to their advantage.

One of the greatest phenomena in this circle is a wonderful cavern in a mountain in the neighbourhood of a village named Szelitze. The neighbouring country is hilly, and abounds with woods; and the air is sharp and cold. The entrance of the above cavern, which fronts the south, is eighteen fathoms high and eight broad, and consequently wide enough to receive the south wind, which here generally blows with great violence; but the subterranean passages, which consist entirely of solid rock, winding round stretch away farther to the south than has been yet discovered. As far as people have gone, the height is found to be fifty fathoms, and the breadth twenty-six; but the most unaccountable singularity is, that in the midst of winter the air is warm in the inside; and when the heat of the sun without is scarce supportable, the cold within is not only very piercing, but so intense, that the top is covered with icicles of the size of a large cask, which spreading into ramifications form very odd figures. When the snow melts in spring, the inside of the cave, where its surface is exposed to the south sun, emits a pellucid water, which immediately congeals as it drops, and thus forms the above icicles; and the very water that drops from them on the ground, which is sandy, freezes in an instant. It is even observed,

that the greater the heat is without, the more intense is the cold within; so that in the dog-days all parts of this cavern are covered with ice, which the inhabitants use for cooling their liquors. In autumn, when the nights grow cold, and the heat of the day begins to abate, the ice in the cave begins to dissolve, so that by winter no more ice is seen; the cavern then becomes perfectly dry, and has a mild warmth. At this time it is surprising to see the swarms of flies and gnats, bats and owls, and even of foxes and hares, that choose this for their winter retreat, till the beginning of spring, when the cold obliges them to quit their dwelling. Above the cavern the hill rises to a very great height, and on the southern side produces plenty of grass.

Among the principal towns of this circle are,

Kasmark, or Kesmark, a royal free town in the county of Sips, not far from the river Popper. It is defended by a wall and towers, and is one of the most antient places in Hungary. It has three churches, and at a small distance from the town is a protestant oratory. It has been frequently taken during the civil wars, and has been several times burnt to the ground.

Leutschau, Lotse, or Lewotse, is a royal free town, and the capital of the county of Sitz. It stands on a hill, and its walls, which are remarkably thick, are strengthened by twelve towers. The church, which is dedicated to St. James, is a fine building. Here is a Jesuits college, and a seminary for noblemen. The inhabitants are mostly Germans: it has been several times sacked, and frequently consumed by fire.

Tokay, a pretty considerable town pleasantly situated near the conflux of the Theis and Bodrug, in the county of Zemplin, and in forty-eight degrees sixteen minutes north latitude. It had formerly a strong castle and a seminary; but is most remarkable for its excellent wine, which in flavour and strength exceeds all other wine produced in Hungary. The spot of land which yields this noble liquor is about seven miles in circumference; and, was all of it to be well cultivated, no part of Europe would be without the rich wine of Tokay.

Munkats is an almost impregnable castle, seated on a high and steep rock which rises in a spacious plain, its natural strength being increased by art and labour. It is the capital of a lordship, which formerly bore the title of a duchy. Beneath it, on the river Latortza, is a town which is the residence of a Greek bishop united to the Roman church, and has a convent of the order of St. Basil. This famous castle surrendered to the Imperialists in 1688, after a blockade of three years. Count Tekely's lady, who had made this long defence, was carried to Vienna, and great sums of money were found in the place.

Great Waradin is a metropolitan city in the county of Bihar, situated on the river Kows, in the forty-sixth degree fifty-three minutes north latitude, and is surrounded with good fortifications. This place was formerly much celebrated for the relics of the canonized king Ladislaus, and is now the residence of a bishop and chapter; and has also a college of Jesuits. The adjoining fortress is a regular pentagon, well fortified and defended by a deep and broad moat. The town itself is not large, but has three suburbs of very considerable extent. It was taken by the Turks in 1660, but the Imperialists re-took it in 1692.

Temeswaer is an important and strong town, the capital of a county of the same name, seated in the forty-fifth degree fifty-four minutes north latitude, and in the twenty-second degree fifteen minutes east longitude. It was formerly esteemed impregnable, it being seated in a morass, which renders it inaccessible, unless it be dried up for want of rain. In 1551 the Turks made themselves masters of it; however, it was taken from them the very same year: but in 1552 it was again invested by the Turks, when the Imperial commandant, dreading their cruelty, set fire to the place, and then abandoned it; but the Turks, extinguishing the flames, took possession of the fort, which they kept till the year 1595, when it was taken from them by the Transylvanians, who afterwards siding with the Turks, the Imperialists made themselves masters of it in 1603; but in 1614 it was

lost again: however it was taken in 1716 by prince Eugene in a dry season, who threw several thousand bombs into the place.

SECT. VI.

Of Lower Hungary, with an Account of the principal Places it contains.

LOWER Hungary consists of the two following circles, that beyond the Danube, which stretches through the upper region towards the western parts, and from the Danube to the Carpathian mountains; and the circle below the Danube. The former contains fourteen counties, inhabited by Hungarians, Bohemians, Slavonians, Germans, and in one part by Servians.

In this circle is the county of Presburg, which lies on the borders of Austria, between the Danube and Moravia. It is about sixty-five miles in length, and forty-three in breadth. Its mountains begin the Carpathian chain. The country about Tirnau is the best and most fruitful; but the soil does not want fertility, though scarce a year passes in which the grain is not damaged by mildew.

The large rivers in this country are the Danube, Morau, and Wag. The air is healthy, particularly on the mountains, but unwholesome among the morasses near the Danube. The inhabitants are Hungarians, Germans, Bohemians, Slavonians, Croats, and a great number of Jews. The dignity of palatine was made hereditary in the year 1599, in the house of Palfi. The whole province is divided into five districts, called by the Hungarians *Processus*, and each has a noble judge.

The principal places of Lower Hungary are,

Presburg, a royal free city, and the capital of the kingdom, seated on the Danube at the foot of a mountain, on which stands the castle; it is pleasantly situated, and enjoys a better air than most of the other towns in Hungary. The cathedral, dedicated to St. Martin, is the place where (from the time of Ferdinand I.) the kings of Hungary have been crowned. Here the diets are held, and the treasury office for Hungary kept. Here are also a chapter of fourteen regular canons, a Jesuits college, with a seminary and church, besides three other convents and churches, a Lutheran church, and a Protestant school. This city is of great antiquity, but is ill built, and the houses of the town, properly so called, do not much exceed two hundred, which are encompassed by a double wall and moat; but the suburbs, which are large and handsome, contain four convents, with their churches, and two hospitals. The suburb on the south side of the city makes a fine appearance, and is famous for the King's hill, on which every new elected king, being seated on horseback, brandishes St. Stephen's sword towards the four cardinal points, to shew that he will defend the country against all its enemies. It is situated in the forty-eighth degree eight minutes, north latitude, and in the seventeenth degree thirty-six minutes, east longitude. Besides its frequent sieges, it has often suffered by fire. Presburg castle stands on a pleasant eminence, two hundred paces to the west of the city: it is of a quadrangular form, with four towers exactly alike at the corners. As the sovereign, when here, resides in this castle, there are in some of the apartments the history of Ferdinand II. with instances of his virtues, painted by eminent hands. In every one of these pieces, which are all on religious subjects, is seen an exact resemblance of the emperor's face. The crown, and other regalia of Hungary, are kept in the above towers, but are never shewn. In the armoury are several ancient arms, both offensive and defensive, with some old machines used in assaults. The prospect from the castle is extremely delightful, especially over the vast plain, towards Lower Hungary and Belgrade. Below the castle is a small town, called by the Hungarians *Varalja*, and by the Germans *Schlossberg*, in which are a great many Jews.

The county of Lipto is about thirty-eight miles in length, and about eight broad; it is every where full of moun-

mountains, which are not only said to be higher than the Alps, but also to surpass them in curiosities and subjects of admiration. Its rocks are indeed astonishing, particularly those of Derminfalo, one of which, called Benikova, is perpendicular, and three thousand paces in height. In these rocks are several vast natural caverns, with multitudes of strange figures formed by the petrified water: bones of an uncommon size are also found here, differently shaped, and even larger than those of horned cattle or horses.

The chief rivers are the Wag and the Biela. There are a multitude of fresh springs in this district, some of which are mineral and medicinal; and there are other waters of different kinds that are very remarkable. The exhalations from those of Szentivan and Stamkowan suffocate birds in their flight over them. The nature of the country admits of very little tillage, and grazing is also inconsiderable, though its cheeses are very famous. This country abounds greatly in metals, particularly the Botfa mountains, which contain mines of gold and silver, some of iron, antimony, nitre, and other minerals; but it has no towns worthy of notice.

In the county of Altsohl, which abounds in valuable ores and minerals, is Herrengrund, which has the appearance of a town lying among the tops of mountains; and all its inhabitants are miners. It is famous for its vast copper works and its vitriol, by which iron is apparently turned into copper, and several hundred weight of iron are thus changed every year. The vitriol indeed does not properly transform the iron into copper, but insinuates into it the copper particles with which it is saturated; and this seeming transmutation requires only a fortnight or three weeks; but if the iron be suffered to lie too long in this vitriolic liquor, it becomes at last reduced to powder.

In this district is Neufohl, a royal free town, and the best of the mine towns. It is situated on the river Gran, and built pretty much in the Saxon manner. It has six churches, a Jesuits college and school, and has a weekly market. It is famous for the copper ore in the adjacent mountains; but though provisions here are good and cheap, the smelting works give the air an unhealthy taint. Upon a hill on the north side of the town is the castle, which is a strong place, and has two churches.

In this county is also the village of Ribar, celebrated for the warm baths on a hill in its neighbourhood. About six hundred paces from it, towards the south, in a fine meadow which makes part of a most delightful valley, is an aperture long noted for its noxious effluvia, which seem to be sulphureous, and kill both beasts and birds. The stream gushes out with great impetuosity, and yet immediately after is absorbed in the aperture. These effluvia are however not poisonous; for the water may be drank, and the dead beasts and fowls killed by it, safely eaten. Not far from this stream is a mineral spring.

The county of Bars is about thirty-eight miles long, and about twelve broad. Its chief rivers are the Gran, the Nitra, and the Sitva, or Zitawa. Here are the most famous hot baths in all Hungary, and rich mines. The country affords good wine, and the level parts grain. Few cattle are bred in the mountains except sheep. The inhabitants consist of Hungarians, Bohemians, Slavonians, and Germans.

In this county is Cremnitz, the principal mine town, which is situated in the forty-eighth degree fifty-two minutes north latitude, and in the 19th degree twenty-one minutes east longitude from London; lying in a deep valley between high mountains, so that it cannot be seen till one is just upon it. The town of itself is an inconsiderable place, though it has two churches, a Franciscan convent, and a castle; for it has not above thirty houses; but the suburbs, which are much larger, consist of nine streets, with a church and an alms-house. In this town the king has a revenue office, with a director, receiver, book-keeper, and other officers. Here is a mint, to which all the other mine towns bring their gold and silver. It is computed to coin every year about an hundred thousand ducats. The mine country in its neighbourhood is divided into the After and Fore Mint; the former containing seven mines, and the latter two;

but all the nine belong to the king. There are also mines which belong to the town in general; and to private persons; but at present they are all so exhausted, that the gold obtained from them scarce answers the expence. On a hill near the town is a castle with a church. The unwholsomeness of the air and water occasions a great deal of illness among the common people. In the year 1751, the emperor Francis I. went down a very deep shaft, in the garb of a miner, and is the only instance of a prince taking such pains to gratify his curiosity.

In the county of Hont is Schemnitz, a pretty large and populous town, in a long valley, the houses of which stand scattered a considerable way up the acclivity on both sides. The protestant inhabitants, who amount to about two-thirds of the town, are between six and seven thousand in number. In the largeness and number of its mine-works, this town surpasses all the others in Hungary. It has two castles, two churches, two chapels, and a college of Jesuits, with a royal mine-office; and is the residence of a chief commissioner. The gold and silver mines here still produce a considerable quantity of ore, which contains more and better gold than that of Cremnitz. Mr. Keyfler observes, that he went down an hundred and fifty fathoms in a shaft without the least danger, being buckled up in a kind of leather chair, after which he descended about fifteen fathoms deeper, by means of a ladder. He adds, that it would require three or four days to walk through all the passages of this mine; that the number of labourers employed in it amount to five or six thousand men, and those without, together with the carpenters, &c. are computed at two thousand, exclusive of those employed about the carriages. The profits are, however, said to be not near so considerable as formerly.

In the above mines are also found crystals, amethysts, and vitriol naturally crystalized. At a small distance is a rock, in which is found a red substance, called cinabar of silver, of which is made a fine vermilion; and near the town is also a high perpendicular rock, part of which is of a shining blue, with green and yellow spots.

The county of Pilis is incorporated with that of Pest. Amidst its mountains and woods is a large plain, which lies between the Danube and Theis, but is for the most part sandy and barren. The principal river is the Danube, and the smaller are the Galga, Tapjo, Kakos, Vajas, Theis, and Zagyva. In the mountainous parts the winters are cold, and the summers temperate; but in the large plains, the winters are severe, and the summers intolerably hot: the warm days are then succeeded by very cold nights: good water is extremely scarce; and the gnats are very troublesome both to man and beast. In the mountainous parts is produced an excellent kind of red and white wine; but no corn can be raised in the sandy soil. The desert plains, however, afford good pasturage for cattle, where they wander at large. The whole province is divided into four districts, the principal towns in which are the following:

Pest, a royal free town in a plain on the Danube, over against Buda, to which is a passage in summer by a bridge of boats. In this city is the supreme court of appeal, also a large military hospital, built with stone, two hundred paces square, and three stories high; six convents, and several churches. In the years 1526, and 1541, it was taken by the Turks, who held it till 1602, when it was recovered by the Hungarians; but the following year, being abandoned through fear, it once more fell into the hands of the Turks, who in 1684, set it on fire, and then marched to Buda; upon this the Imperialists took possession of the town, but abandoned it again, and did not return till two years after, when the inhabitants were reduced to great distress.

Vaitz is a populous episcopal city, pleasantly situated on the Danube. Besides the houses belonging to the bishop, here are three convents, and a seminary. The city chiefly owes its prosperity to its great annual fair, and beast market. It has been frequently destroyed by fire, and several times taken by the Turks and Imperialists.

Buda is the name both of an old and new city, situated in the forty-seventh degree forty minutes north latitude,

latitude, and in the nineteenth degree twenty minutes east longitude. Old Buda is situated in a plain which extends from the suburbs of New Buda to the Pilis mountains and the Danube, and at present is a mean place; in which are seen the desolate ruins of the old city, with several Roman monuments. New Buda was built by Bela IV. and is a royal free town, seated on a mountain by the Danube. It was formerly the capital of the kingdom, the residence of the king, and the largest and finest of all the Hungarian towns; but has been much reduced by its being frequently besieged, taken, and destroyed. The principal church is that of the Virgin Mary, near which the Jesuits have an academical college and seminary. The Carmelite nuns of St. Clare have convents here, and the Franciscans have several churches. The city is surrounded with walls and moats, and is well fortified; near it stands a strong castle. The palace of the Hungarian kings was reckoned a most beautiful building, but it is entirely destroyed. It has three suburbs; in that called Neustift is only one church, together with a pillar fifty-two feet high, which in 1690 was dedicated to the Holy Trinity, to commemorate a deliverance from a pestilence, which ceased in 1715. In the suburb called the Wasserstadt, or Water-Town, which lies on the Danube, are two churches and one convent; and on the hill is Reichenstadt, in which is a Russian Greek church. Lady Wortly Montague, who was there in the year 1717, says, that without the walls lie a vast number of little houses, or rather huts, called the Rascian Town, from its being entirely inhabited by that people. The houses stand in rows, and appear at a distance like old-fashioned thatched tents, each consisting of one hovel above, and another under-ground. These are their summer and winter apartments.

In the suburbs of Wasserstadt and Reichenstadt are five warm baths; the principal of which, called the Emperor's, is built somewhat in the manner of the Rotunda at Rome, with a large aperture in the centre of the dome, besides several small holes or windows round the cupola for admitting more light. In a large bath in the centre of the other four, both sexes publicly bathe together, the men wearing only a kind of drawers, and the women what they term a fore-shift; but the common people, for whom one of the other baths is appointed, look upon even this slight covering as superfluous. There is also a pond of mineral water, which has this surprising property, that when the water is wholly turned off, the water-springs cease flowing, but when the pond is a little above half full, they return again. The wine produced on the neighbouring hills is red, and of a very good sort. Here are also excellent melons, which are sold for the value of a penny a piece.

Buda was first taken by Solyman the Magnificent, in 1526, and lost the following year to Ferdinand I. king of Bohemia. Solyman regained it by the treachery of the garrison, and voluntarily gave it up to king John of Hungary; after whose death, his son being an infant, Ferdinand laid siege to it, and the queen-mother was forced to call Solyman to her aid, who indeed raised the siege, but left a Turkish garrison in the town, and commanded her to remove her court from thence, to which she was forced to submit. It afterwards resisted the sieges laid to it by the marquis of Brandenburg, in the year 1542; by count Schwartzburg, in 1596; by general Rosworm, in 1602; and by the duke of Lorraine, commander of the emperor's forces, in 1684, to whom it yielded in 1686, after an obstinate defence; Apti Basha, the governor, being killed, fighting with the utmost bravery in the breach. The loss of this town was of such importance, and so much resented by the Turks, that it occasioned their deposing of their emperor Mahomet IV. the year following.

About a mile and a half below Buda is the island of Eszpeel, in the midst of the Danube, and surrounded on both sides by small islands, among which the Pheasant island is particularly remarkable, and is a thousand paces long, and covered with wood. The island of Ujvalvische is twenty-seven miles in length, and has a ruined church, said to have been built by St. Margaret.

This island is not very fruitful, but it abounds with game, and has great plenty of hares. Near the island of Eszpeel a promontory, covered with woods and vines, projects into the river; and in its neighbourhood is a pleasant and fruitful plain, about five miles in circumference, containing the seat of prince Eugene, who often resided here, and had a breed of Arabian sheep; and on this plain are scattered several farm houses.

We now come to the other circle of Lower Hungary, which is that below the Danube, containing twelve counties, and is inhabited by Hungarians, intermixed with Croats, Rascians, and some Sclavonians. The principal places in this circle are,

Edenburg, or Sopron, a royal free town in the county of the same name, and though not very large is well built, populous, and has extensive suburbs. The inhabitants apply themselves with great industry to the cultivation of vineyards, and the wine is accordingly remarkable for its goodness. Here is a Jesuits college, and a Lutheran school. Among the diets which have been held here, that in 1681 is remarkable for the free exercise of religion granted to the protestants by the emperor Leopold.

Raab, which was made a royal free city so lately as the year 1742, is an ancient and strong fortress, situated in a pleasant country at the conflux of the Danube, the Raab, and Rabsnitz, by which it is encompassed. Its houses are all built with stone, the streets are large and straight, and it has a bishop, a chapter, and an university, the professors in which are Jesuits. The fortifications of the city and castle are chiefly the work of the emperors Ferdinand I. and Maximilian II. and it has always a strong garrison well provided with military stores. In the year 1529 the garrison, for fear of the Turks, first set fire to the castle, and then abandoned the city. In 1566 it was burnt to the ground. In 1594 it was by agreement delivered up to the Turks, from whom it was afterwards recovered by stratagem, by count Adolphus of Swartzenburg. In 1749 the churches and schools of the Lutherans and reformed were suppressed.

The city of Gran, the capital of the county of the same name, is situated in a delightful country at the conflux of the river Gran with the Danube, in the forty-eighth degree twenty-one minutes north latitude, and in the eighteenth degree forty-six minutes east longitude. This city was formerly the residence of the primate of Hungary, and had also a chapter, which is removed to Tirnau; and the archbishop resides at Presburg. There is here a Jesuits college and school. The city of Gran properly consists of a royal free town, the castle, which is situated on a high rock, and in which is the cathedral; the Wasserstadt, which lies on the Danube; with the Rascian town, Thomsberg, and Jungerstadt: all which are fortified so as to be a mutual defence to each other. King Stephen was born here in the year 909, and buried in the cathedral built by himself. In 1543 the city was for the first time taken by the Turks; but in 1596 it was taken from them by the Imperialists. On this occasion Sir Thomas Arundel, of Wardour-castle, for his signal bravery in storming the water-tower, and pulling down the Turkish banner, &c. was created a count of the empire by the emperor Rodolph, and afterwards king James I. made him a baron of England, which honours are still enjoyed by his posterity. The Turks besieged it in vain in the year 1604; but the following year they obliged the city to surrender, and kept it till 1683, when, after the defeat of their army before Vienna by John Sobieski, the Imperialists once more recovered it, and afterwards defended it against the Turks, who laid siege to it in 1685, but were entirely defeated by the dukes of Lorraine and Bavaria, and it is still subject to the house of Austria.

Comorra is situated in the island of Schutt, at the conflux of the Wag and the Danube. In this town is the court-house of the county, with a Jesuits college and school; and near it is an impregnable fortification, surrounded on the west with deep moats, and on the north and south by the Danube and Wag, which meet to the southward. It was built by Ferdinand I. and it is remarkable that it never fell into the hands of the Turks.

S E C T. VII.

Of TRANSYLVANIA.

Its Names, Situation, Extent, Climate, Mountains, Rivers, Minerals, Plants, and Animals.

THE country now known by the name of Transylvania was a part of the ancient Dacia, and derived its present name from its lying behind the forests with which the Carpathian mountains are surrounded; and for the same reason the Hungarians call it Erdely, which signifies a woody mountainous country. The Germans give it the name of Siebenburgen, from seven celebrated forts, or castles, by which it is defended. Transylvania is bounded on the north by Moldavia, Poland, and Hungary; on the east by Moldavia; on the south by Walachia, and the bannat of Temeswar; and on the west by Hungary; extending from forty-five degrees thirty minutes to forty-eight degrees ten minutes north latitude, and from twenty-two to twenty-five degrees east longitude, and is about a hundred and seventy miles in length, and a hundred and twenty in breadth.

This country is on all sides environed with mountains, whence it enjoys temperate air, and springs of excellent water; and though it is both mountainous and woody, yet its fields are so rich and fertile, that it is destitute of none of the necessities, and few of the luxuries of life. The mountains of Transylvania run from north to south, branching out likewise east and west, and terminating in the center of the country in hills, clothed with vineyards and rich in mines. The former are situated in the southern parts of the country; but in some places the grapes are prevented from being thoroughly ripened by the northerly blasts. In several of the mountains metals and minerals are found, while others yield rock-salt. There are here medicinal springs, some of which are warm, others cold, and others sulphureous.

The chief rivers are the Samos, the Maros, which traverses the middle of the country, and the Aluta, which rises at the foot of the Carpathian mountains, and runs into Walachia.

The minerals of this country are gold, silver, copper, iron, quicksilver, cinnabar, solar antimony, sulphur, vitriol, rock-salt, salt-petre, red oker, and chalk, which are exported from hence to Hungary.

Transylvania produces medicinal herbs, grain, pulse, vines, and several kinds of fruit-trees, with wood fit for timber. The soil is indeed extremely fruitful. The wheat is esteemed the best in Europe, and so plentiful, that the peasants eat no other bread: but their soil is less fit for barley, and therefore they brew but little beer; this defect, however, is supplied with plenty of good wine, which is little inferior to that of Hungary.

In the meadows and pastures they feed vast herds of large oxen, which are there extremely cheap. They have also sheep, and a good breed of horses. Their forests abound with many kinds of wild beasts, particularly buffaloes, elks, deer, wild boars, hares, which are much larger, and have a more valuable fur than ours; wild horses of incredible swiftness, whose manes hang down almost to the ground; some parts of the country are infested with wolves and bears, which in winter do great mischief among the cattle: there are also wild asses, lynxes, chamois, martens, ermines, and beavers. The woods afford plenty of bees and honey, with which they make a sort of mead that is highly valued; the honey being mixed with several other pleasant ingredients.

S E C T. VIII.

Of the different Nations who inhabit Transylvania; their Religion, Learning, Government, Arms, Forces, Revenue, and Administration of Justice.

WITH respect to the various nations who inhabit Transylvania, these are Hungarians, who in their natural genius, understanding, disposition, and language, resemble the natives of the country; the Siculi, a people descended from the Scythian Huns, and formerly en-

joyed some particular privileges on account of their antiquity; but these have been gradually abolished: they speak the Hungarian language, but their pronunciation is broad, and they also retain some old Hun words: the Saxons, who are partly the remains of the Gepidi, and partly the descendants of those Saxons who in 1154 entered the country: these stiffly adhere to their natural disposition and ancient customs, which are widely different from those of the two above-mentioned nations, but resemble the modern Hungarians, and like them apply themselves to learning, war, arts, and trade. Their language agrees with that spoken in Lower Saxony. These are the principal people of this country, and the rest, who are esteemed foreigners, must unite with one of the above nations.

Those whom they thus call foreigners are the Germans, who speak the same language as the other natives of Germany, but a different one from that of the Saxons: the Walachians, the descendants of the ancient Roman colonies, who therefore stile themselves Romanians, that is, Romans. Their language consists of a great deal of Latin, corrupted with a mixture of the Sclavonian. These resemble the Romans in their dress and diet, and are fond of the Italian language; the waywodes have their physicians and secretaries from Italy, and the few who apply themselves to literature go to the university of Padua. They reside in the mountainous parts of the country, and wholly apply themselves to agriculture. From their first embracing the Christian religion, they have professed themselves of the Greek communion; but since Transylvania became subject to the house of Austria, the Jesuits have been perpetually endeavouring to unite them to the Romish church, under the ambiguous title of the *Græci ritus Uniti*. The qualifications of the Walachian clergy barely consist in their being able to read and sing; and when any of them would shine, he makes a tour to Bucharest in Walachia, where he learns to be polite, and to speak in an ornamental stile; but returns in other respects as illiterate as he went. The common people among the Walachians are said to be so ignorant, that scarce one in twenty of them can repeat the Lord's Prayer. The others are Armenians, who have a particular language, and chiefly apply themselves to trade, Rascians, Bulgarians, Greeks, and Jews.

The Hungarians, the Siculi, and a few Saxons, are of the Romish church, and have some rites and privileges in common with that church in Hungary: these are under a bishop who resides at Weissenburg, and is subordinate to the archbishop of Colotza. The reformed, who consist of the Hungarians and Siculi, have a superintendent, who by the laws of the kingdom is the second in rank. The protestant Lutheran church, which consists of Saxons and a few Hungarians, is divided into nine chapters, and governed by a bishop. This church, with respect to the number of its members, is so superior, that there are reckoned twenty-five protestants to one catholic. The Socinians, or Unitarians, were formerly the prevailing sect; but at present they are greatly dwindled, though they have still a superintendent. These four churches are established by the laws of the kingdom. The Greek religion, professed by the Walachians and Greeks, has particular privileges granted by the prince of the country, as well those who are united to the Romish church, as those who dissent from it. Over the former is a bishop, who has priests under him; but the latter is subject, in ecclesiastical affairs, to the bishops of Walachia; and under these also are the Armenians, some of whom differ, in point of public worship, from the Greeks, while others acknowledge the church of Rome.

With respect to the state of learning in this country, the catholics have a college of Jesuits at Clausenburg, and several seminaries. The different sects of protestants have likewise seminaries and schools, in which the elements of the sciences are taught; after which, such students as are of the reformed religion go to Switzerland and Holland, but the Saxons are sent to study in Germany.

The government of Transylvania is entirely different from that of Hungary, and by the joint consent of prince and people, is formed into an aristocratical government, which

which since the year 1722 has been hereditary to the princes and princesses of the house of Austria. Formerly the prince of Transylvania succeeded to the government by a free election; but since the above period, by inheritance; and though his power is connected with that of the king of Hungary and the arch-duke of Austria, yet his government and privileges differ from both.

The principality of Transylvania is governed in the name of prince and nobility, by the diet, the office of state, the royal government, the exchequer, the assembly of Hungarian counts, the tribunals of justice, and the magistrates of the Saxons and Siculi.

The diets meet at Hermanstadt, by summons from the prince, and are divided into the upper and lower table: at the upper table sits the government, with the prelates, counts, and barons: at the lower, the king's council, with the deputies of the Hungarian counts, the tribunals of the Siculi and royal Saxons; and at each sits a president, who represents the sovereign, and lays the king's intentions and proposals before the states.

The Transylvania office, which draws up and sends away the prince's orders, is held at Vienna, and, with respect to public affairs, has not the least connection either with those of Austria or Hungary.

The royal government resides at Hermanstadt, and superintends both the temporal and spiritual affairs of the principality. At its head is a governor with the counsellors of the three nations, and also of the three religions, the Romans, the Calvinists, and the Lutherans.

The exchequer is divided into the Transylvania and mine-office. The former is held at Hermanstadt, and that of the latter at Abrug-Banya.

The arms of Transylvania are divided into three parts, by two indentations diverging downwards. In the first are seven Hungarian castles in a field or; in the second, in a field gules, the eagle of the Siculi; and in the third, the Saxon sun and moon in a field gules.

Transylvania could formerly bring from eighty to ninety thousand men into the field; but at present the whole force of that principality consists of six regiments, under a commander in chief, for the defence of the country.

The revenue of Transylvania rises from contributions, customs, metals, minerals, rock-salt, royal domains, escheats, and confiscations, and are levied by the treasury.

With respect to the administration of justice, civil causes are tried in the prince's name, in the superior and inferior courts; and each of the three nations has its particular court. In the royal free towns which belong to the Saxons, the causes of the burghers are first heard before the judge of the town, and afterwards discussed by the town council, from which there lies an appeal to the meetings of the towns, when they hold the national court; and from this court an appeal lies to the *Tabula regia*. In the Hungarian counties, the causes of the gentry are first tried by their judge, and then brought before the whole body of the nobility; from whom also lies an appeal to the *Tabula regia*. In the courts of the Siculi, who have their peculiar customs and privileges, causes are first heard before the king's judge, and in dubious cases carried up to the king's lieutenant, and from him to the *Tabula regia*. This *Tabula regia*, or royal table, is the chief court of justice, and has a president with prothonotaries and assessors; yet even from this board causes may be carried up to the government, and from thence removed to the sovereign.

In affairs relating to the church, there is only one court, which is held at the residence of the bishop of Transylvania, from whom appeals lie to the metropolitan, from him to the pope's nuncio, and from thence to the court of Rome.

S E C T. IX.

A concise Description of the principal Places in Transylvania.

THE whole country of Transylvania is divided into seven Hungarian counties; the territory of the Siculi, which is subdivided into seven tribunals; and

the royal country of the Saxons, which consists of five districts. The principal places in Transylvania are,

Clausenburg, which is seated on a plain by the rivulet of Samos, near the foot of a mountain, in the forty-seventh degree fourteen minutes north latitude. This is a large populous town, that has many houses of stone, and strong walls fortified with towers. Over the Portina gate is still to be seen an inscription in honour of the emperor Trajan. The Jesuits have a college here, and the reformed a seminary; as have also the Socinians, who are very numerous. Till the year 1603, they were in possession of the cathedral, which was taken from them, and given to the Jesuits, whose church and college they had pulled down. This town has been several times besieged and taken.

Hermanstadt, by the natives called Zeben; is the capital of Transylvania, situated in that part called the royal country of the Saxons, in the forty-sixth degree fifty-one minutes north latitude, and the twenty-fifth degree one minute east longitude. It stands in a plain, and is large and well built, and is defended by a double wall and deep moat. This is the principal place of the Saxon colony; and it is governed by the royal chamber, the tribunal of appeals, and the diet; besides which, the general and royal governor of the Saxon nation reside here. The air is however unwholesome, and produces the gout; so that many of the finest buildings are uninhabited. The houses within the gates are mostly well built, and covered with slates, which in this country is reckoned an extraordinary piece of magnificence. Besides several good springs in and about the place, the river water is conveyed through every street by little canals. This city is a granary for the whole principality. Its principal trade consists in cloth and mead, made here in great quantities for exportation into the neighbouring countries. This city had formerly a considerable trade with Greece, which they lost during the wars; but it has greatly declined on account of the persecution the inhabitants have suffered, and the severity of the government.

Weissenburg, or Carlsburg, is a strong well built town, situated on a rising ground, from whence, for about two miles round, there is a most delightful prospect of a fruitful country, amidst corn-fields and eminences covered with vines. It is watered by the gentle streams of the rivers Ompay and Marisch, and is two miles in length; but was much larger formerly, as appears from its ancient boundaries within the walls, which are said to be twenty miles in compass. It was for a long time the metropolis of ancient Dacia, and was called Alba Julia, from Julia Augusta, the mother of the emperor Marcus Aurelius Antoninus; and is now generally called Carlsburg, in honour of Charles VI. by whom it was considerably improved. It had formerly a magnificent palace, which is now gone to decay, and has at present a bishop and a college of Jesuits.

The last place we shall mention in Transylvania is Cronstadt, which is next in rank to Hermanstadt, both with respect to its appearance, the number of its inhabitants, and its trade. It is seated among pleasant mountains, and is fortified with walls, towers, and moats. None reside in the town itself beside Germans, but in its three large suburbs are Hungarians, Saxons, Bulgarians, and Siculi.

S E C T. X.

Of SCLAVONIA.

The Extent, Climate, Rivers, different Inhabitants, Languages, Government, Administration of Justice, both in Slavonia and Croatia. The Divisions of Slavonia, and its principal Towns.

WE shall now treat of the country by some authors called Hungarian Illyricum, which extends from the Danube to the Adriatic Sea, between the rivers Drave, Save, and Unna, and comprehends Slavonia, Croatia, and Dalmatia.

The country which lies between the Drave and Adriatic enjoys a mild and temperate air, and a fruitful soil; but

but the maritime places are not esteemed healthy. It produces all the necessaries and conveniencies of life, particularly corn, wine, and oil; and besides the rivers already mentioned, has the Culpa, which rises in Croatia, and falls into the Save; the Kerka, which together with the small rivers of Dalmatia, discharge themselves into the Adriatic sea.

The inhabitants are of Slavonian extraction; and according to the different provinces, are divided into different people, among which are Hungarians, Germans, Venetians, and Turks. The principal nations are the Slavonians, who make as it were one people with the Servians and Rascians, which, with a mixture of Germans and Slavonians, inhabit Slavonia: the Croats, who dwell in Croatia and Slavonia, and are intermixed with colonies from Germany and Walachia: the Dalmatians, among whom are the Uscocs and the Morlachians. They have likewise Venetian, Turkish, and Albanian colonies among them.

With respect to the languages of these different people, the Croats and Rascians speak German and Hungarian; the Dalmatians, Italian and Turkish; the Walachians who have settled in these countries retain their own language.

The only religion tolerated here is the Romish, which is under the government of three archbishops and twenty bishops. These nations, however, concern themselves little about study; yet Zagrad has an academy; and among the Croats and Rascians are many persons of an excellent genius, who entertain a passion for literature, which they endeavour to promote.

The government of Slavonia and Croatia is connected with that of Hungary and Stiria, being hereditary in the archducal house of Austria. Croatian Hungary is under the jurisdiction of the ban or viceroy of Croatia, Slavonia, and Dalmatia, who governs by the laws of Hungary, and the provincial acts of Illyricum. Croatian Stiria has a governor both in Stiria, military Croatia, and on the coast of the Adriatic.

The prelates, nobility, gentry, and royal Castellans, enjoy the same privileges as the Hungarians. At the diets, which consist of the four orders of the province, all deliberations run in the name of the sovereign; and besides, the states of Illyria appear at the Hungarian diets by their representatives.

The administration of justice in Slavonia and the bannat of Croatia is the same as in Hungary; the free towns having inferior courts, from whence causes may be removed to the royal treasury. The other towns have also their inferior courts, from whence there lies an appeal to the bannat court, which is thus named from the ban, or prorex, who presides in it; and this at certain times hears causes brought from the counties, and holds consultations on other important matters; but sometimes, when the causes require a farther inspection, the litigants are dismissed to the *Tabula regalis* at Pest, from whence they may proceed to that of the *Septemviralis*.

The public revenue arises from contributions, customs, tillage, graziers, and trade. The military force of the Hungarian Illyrians perhaps never appeared to greater advantage than in the war which preceded the last, when no less than fifty thousand men were brought into the field from Croatia alone.

We shall now proceed to give a concise account of Slavonia.

Slavonia is situated between the Drave and the Save, extending eastward to the Danube, and being bounded on the westward by Carniola. It obtained the name of Slavonia in the middle ages, from the neighbouring Slavi or Slavina. The inhabitants are Servians or Rascians, Croats, and Walachians, with some German and Hungarian colonies. This country is divided into the bannat and generalship of Slavonia, the former of which is subdivided into three counties, the principal towns in which are,

Esseck, the capital of the county of Verowitz, is seated on the river Drave near the Danube, and is most remarkable for the large wooden bridge which is here erected over the Danube and the neighbouring morasses, and extends in length about five miles; it was built in 1566, by Solyman, emperor of the Turks, who con-

stantly employed twenty thousand men in this work till it was completed. In the year 1529 Esseck was taken by the Turks, and in 1664 the Imperialists burnt this bridge; but it was soon rebuilt by the Turks. The Hungarians afterwards burnt the bridge a second time, and in vain attempted to take the town; but after the battle of Mohatz, the Turks voluntarily evacuated it. This city is situated in the forty-fifth degree fifty-one minutes north latitude, and in the nineteenth degree ten minutes east longitude.

Carlowitz, a military town, the residence of the Greek bishop of Slavonia, and famous for its red wine, and for the peace concluded there with the Turks in 1699.

Peterwaradin is a town situated on the Danube, opposite Belgrade, six miles to the south-east of Carlowitz. It is strongly fortified, and is the frontier town of the Imperialists. The Turks made themselves masters of it in the year 1526; but quitted it in 1687, when the Hungarians took possession of it. But it is chiefly remarkable for the glorious victory obtained near it over the Turks in the year 1716, by prince Eugene.

SECT. XI.

Of CROATIA.

Its Situation, Extent, Inhabitants, and principal Places.

THIS country, which is called by the Hungarians Horwath Orszag, is bounded on the east by Slavonia and Bothnia, on the north and west by Stiria and Carniola, and on the south by Turkish Croatia and Dalmatia. The Croats are of a good stature, and make brave and hardy soldiers. They derive their origin from the Slavi. In the middle ages they had sovereignties of their own, who styled themselves kings of Croatia and Dalmatia; but were for some time subject to the emperors of the East. In the eleventh century Croatia and Dalmatia devolved to the kings of Hungary, to whom they have ever since continued in subjection, though not without frequent attempts to recover their independency.

The Croats, of all the Illyrian nations, have the greatest affinity in their language to that of the Poles.

Croatia, which is about eighty miles either way, is divided into two parts; that within and that beyond the Save; and is inhabited by Croats, a few Rascians, Greeks, and Walachians.

The chief towns in Austrian Croatia are,

Little Waradin, a royal free town on the river Drave, strengthened with a castle and bulwark; it stands in a large plain. Between this town and a high mountain is a warm bath, formerly called *Thermæ Constantinianæ*.

Kreutz, a royal free town, that is fortified, and has many privileges.

Iwanitz, a strong fortress on the river Koros, where the kings of Slavonia formerly resided.

Zagrab, or Agran, a royal free city, seated on the Save. It is the capital of Croatia, and has a bishop and chapter.

Besides a considerable number of other towns, of which we know little more than their names.

Turkish Croatia lies on the other side of the Unna, and as we have already given an account of it in treating of Turkey in Europe, we shall now pass on to Dalmatia.

SECT. XII.

Of the Kingdom of DALMATIA.

Its Name and History. The Climate and Face of the Country. A particular Account of the Uscocs and Morlachians; with a Description of the principal Places in Hungarian and Venetian Dalmatia; also a concise Account of the Republic of Ragusa and its Capital.

DALMATIA obtained its name from its antient capital Delmum, or Delminium, which was taken and destroyed by the Romans, who brought this country under their yoke; but Dalmatia shook it off no less than five times.

On

On the division of the provinces between Augustus and the senate, Dalmatia fell to the latter, as one of the provincial provinces; but they voluntarily ceded it to the emperor, and at the demise of Constantine the Great it was reckoned among the western parts of Illyricum. It suffered extremely by the inroads of the northern barbarians, and was reduced by the Goths in their way to Italy. Afterwards Justinian, emperor of the East, conquered not only Dalmatia, but Italy; but in the year 1548 the Sclavi entered the country, and about the end of the reign of Heraclius established themselves there. Dalmatia had then its particular kings, of which Zlodomia, or Zaromyr, dying without issue, left the kingdom to his consort, who bequeathed it to her brother St. Ladislaus, king of Hungary, and it has been ever since dependent upon that crown; but the Venetians are masters of the maritime parts. In the wars which the kings of Hungary had with the Venetians and Dalmatians, they were for some time successful; yet in the fifteenth century the Venetians reduced the whole kingdom of Dalmatia, but the Turks have since dispossessed them of a considerable part, and at present the Hungarians, Venetians, Turks, and Ragusans, share it among them.

The Dalmatians have the Sclavonian language and customs, and profess the Romish religion.

The air of Dalmatia is pure and temperate. The country is as it were strewed with fertile mountains that produce olives, vines, myrtles, and a great variety of palatable and wholesome vegetables; and have also in their bowels treasures of gold and silver ore. This country has also many fertile plains, are watered by rivers that have a short course, though they are mostly navigable; and these plains feed many herds of horned cattle, and large flocks of sheep.

Before we give a description of the several parts of Hungarian Dalmatia, which lies in the upper part of the Adriatic Sea, it is necessary to give some account of the Uscocs and Morlachians. The Uscocs are a people who, galled by oppression, escaped out of Dalmatia, whence they obtained the name of Uscocs, from the word Scoco, which signifies a deserter: they are also called springers, or leapers, from the agility with which they leap, rather than walk, along this rugged and mountainous country. Their chief settlement was at Clissa; but the Turks taking that place in 1537 they retreated to Zengh, which was granted them by the emperor Ferdinand; but in 1616 they were ordered, on account of their robberies, and other acts of violence, to remove and settle at a place appointed for them in a mountain of Carniola, four German miles in length, and two in breadth. In the center of this mountain stands Sichelberg castle, to the governor of which all the Uscocs are subject. Some of them live in scattered houses, and others in large villages. They are a rough, savage, people, large-bodied, intrepid, and given to rapine, though their only visible employment is grazing. They use the Walachian language, and in their religion come nearest to the Greek church; but some are Roman catholics. They have an archbishop, bishops, popes, or priests, and coluges, or monks; their priests are not prohibited marriage, but the wife must be of a good family, and at her decease they are not to marry again. Their children are not baptized till they are adults; and none among them go to confession under thirty years of age.

Morlachia extends from the jurisdiction of Zengh, near St. George, to the county of Zara; or, according to others, from Vinodok to Novigrad; it being fifteen German miles in length and five or six in breadth, and full of high mountains. The inhabitants are a branch of the Walachians, and are very swarthy; but are a large, strong, robust people, inured to toil and hardships from their living amidst barren mountains. Their chief employment is attending cattle, and the greatest part of them are of the Greek religion. Some of them at present are under the protection of Hungary, and others are dependent on the Venetians. There is hardly a place of any strength in Dalmatia that is not governed by these people. Hungarian Dalmatia consists of five districts, most of which are under the generalship of Carlstadt, in which the most remarkable places are the following:

Zengh, Segnia, or Senia, a royal free town, fortified both by art and nature, is seated near the sea in a bleak mountainous and barren soil. The bishop of this place is a suffragan to the archbishop of Spalatro. Here are twelve churches and two convents. The governor resides in the old palace called the royal castle, and in the upper fort, which stands on a rising ground fronting the town, lives the deputy-governor. Near this place dwell the Uscocs.

Ottoschatz, a frontier fortification in the river Gatzka, which abounds with fish: that part of the fortress where the governor and the greatest part of the garrison reside, is surrounded with a wall and some towers; while the rest of the buildings, which are but mean, are erected on piles in the water, whence one neighbour cannot visit another without a boat.

We have already given a description of Turkish Dalmatia in treating of Turkey in Europe, and shall now therefore proceed to that part of the country called Venetian Dalmatia, and the republic of Ragusa.

Venetian Dalmatia is situated to the south-east of the country last described, on the borders of the Adriatic Sea, and abounds in castles and fortified places, though but few of them are of modern structure. The principal places in this country are,

Zara, the capital of Venetian Dalmatia, is situated in the country of the same name, in the forty-fourth degree twenty-two minutes north latitude, and is surrounded on all sides by the sea; but has a communication with the continent by means of a draw-bridge, which is defended by a fort. This is esteemed one of the best fortifications in Dalmatia, and is thought to be almost impregnable. The citadel is separated from the town by a very deep ditch hewn out of the rock, and in the castle resides the governor, or proveditor of Dalmatia, whose office is only triennial. The harbour, which lies to the north, is capacious, safe, and well guarded; and the rain is carefully preserved in cisterns to supply the want of fresh water. It is the see of an archbishop, and St. Simeon is patron of the city; and in the cathedral, which is dedicated to him, they pretend to shew his body deposited in a coffin covered with a crystal lid. There are very fine paintings in the churches done by the best masters; and near the church called by the Greeks St. Helia are two handsome fluted columns of the Corinthian order, supposed to have been part of the temple of Juno. This city was formerly more considerable than it is at present, the walls being but two miles in compass, and the number of the inhabitants not exceeding six thousand.

Tenen, a fortified town on the extremities of Bosnia and Dalmatia, is seated on a hill, and, though not large, is esteemed of importance from its elevated situation. It is encompassed with two very broad and deep natural moats, formed by the rivers Kerka and Botisniza, which precipitate themselves at a small distance from the hills. This city, which, in the thirteenth and fourteenth centuries, was the capital of a country, is the see of a bishop. In the year 1522 it was taken by the Turks. In 1649 it was recovered by the Venetians, and for the most part demolished; but it was afterwards rebuilt by the Turks, and again taken from them by the Venetians.

Trau, or Tragurium, a town on a peninsula, but separated from the continent by a canal. It is divided into the Old and New Town, the former of which has a single, and the latter a double wall. Its three towers are also a good defence. Nothing can be pleasanter than its situation; for the north side is covered with beautiful gardens, and on the island of Bua it has fine suburbs, that have a communication with the town by means of a stone bridge, and is joined to the continent by three of wood. It is the residence of a Venetian proveditor, who bears the title of count, and also of a bishop, suffragan to the archbishop of Spalatro. The harbour, which is formed by a bay, has depth of water sufficient for the largest ships which ride there, sheltered by two capes.

Spalatro, the capital of Venetian Dalmatia, is seated on a peninsula fortified with good bastions of free-stone, but these works are commanded by the neighbouring mountains. This city is the see of an archbishop, who is primate of all Dalmatia and Croatia. It is also the staple where

where all merchandize passing from Turkey to Italy must be transacted. Near its harbour, which is very large and deep, is erected a large lazaretto for performing quarantine. Among the Roman antiquities to be seen here are the noble remains of Dioclesian's palace, on which the city itself is built, and its walls make two-thirds of those of Spalatro. It is in the forty-third degree fifty-three minutes north latitude. This city has been possessed by the Venetians ever since the year 1420.

Castel Nuovo, the best fortification in all Dalmatia, was antiently called Neocastro, and was built by a king of Bosnia in 1373, on a high rock adjoining to the sea. It is better fortified by nature than by art, it being an irregular quadrangle, secured towards the sea by shelves and inaccessible rocks. In the upper town is the castle of Sulimanega, and the fortified town of Hastavich; but its best fortification is the capital of Cornigrad, which stands about six hundred and fifty paces north of the town. It was taken by the Venetians, and is now a place of considerable trade.

Within this province are also several islands, as, 1. Osero, or Oforo. 2. Cherso, which has a communication with the former by means of a bridge. It is a woody tract, and breeds great numbers of cattle. It has a pretty populous town of the same name, that has a convenient harbour. 3. Vegia, or Veglia, is separated from the continent by a narrow channel, and has a town of the same name, which has a harbour and castle, in which resides the Venetian count or governor. 4. Arbe, which abounds with figs and the smaller kinds of cattle, and produces most delicious wine. Its capital is an episcopal city. 5. Great Isola, which contains several towns and castles. 6. Mortara, or Mortero, which has a deep and secure harbour between two islands. It is celebrated for its wine, and its abounding also in olives and melons. The town of the same name is seated in a valley between two hills of various culture. 7. Lesina, said to be the celebrated isle of Pharos, is rocky, but produces figs; bread and wine are very cheap, and from hence all Italy and Greece are supplied with sardines. The town of the same name, though small, is well fortified. 8. Corzola-nigra, the antient Corcyra, abounds with timber of all kinds. In the city of the same name, which is the only one in the island, reside the governor and a bishop. It is fortified with strong walls and towers, has a fine harbour, and produces plenty of wine. The Turks, attempting to make a descent here, were, in the year 1507, repulsed by the women, who behaved with heroic resolution, when their dastardly husbands had, through fear, deserted the city, and fled up into the country. Besides these there are several other islands.

We now come to Ragusan Dalmatia, which lies to the south-east of the former, and is about fifty-five miles in length, and twenty in breadth. Ragusa is an aristocratical state, formed nearly after the model of that of Venice. The government is in the hands of the nobility; and the chief of the republic, who is stiled rector, is changed every month, and elected by scrutiny, or lot. During his administration he lives in the palace, wears a ducal habit, composed of a long silk robe with white sleeves, and his salary is five ducats a month; but if he be one of the *pregadi*, and assists at appeals, he receives a ducat a day. Next to him is the council of ten. In the great council all noblemen above twenty years of age are admitted, and in this council are chosen the persons who constitute the board of the *pregadi*, who superintend all civil and military affairs, dispose of all employments, and receive and send envoys. These continue a year in their office. The little council consists of thirty nobles, who take care of the polity, trade, and revenues of the

state, and decide appeals of small value. Five *proveditors* confirm, by a majority of votes, the proceedings of the administration.

Civil causes, and particularly those relating to debts, are first heard before six consuls, or senators, from whom there lies an appeal to the college of thirty, and from them again, in particular cases, to the council. In criminal causes special judges are appointed. There are likewise three commissioners for the woollen trade; a board of health, consisting of five nobles, who endeavour to preserve the city from all contagious diseases; and four patrons of eminence manage the taxes, excise, and mint.

As the Ragusans are unable to protect themselves, they make use of their wealth to procure them protectors, the chief of whom is the grand seignior. They are said to pay tribute to the Turks out of fear; to the Venetians out of hatred; to the pope, emperor, Spain, and Naples, out of respect and political views. The tribute to the Porte, with the expences of the annual embassy, amounts to about twenty thousand sequins, worth about nine shillings and two-pence each. The Turks are indeed of great service to them, by bringing thither all kinds of necessaries, especially fire-arms and military stores; and the Ragusans keep so watchful an eye over their freedom, that the gates of Ragusa, their capital, are allowed to be open only a few hours in the day.

They profess the Romish religion; but the Greeks, Armenians, and Turks are tolerated. The language chiefly in use among the Ragusans is the Sclavonian, but the greatest part of them also speak the Italian. Almost all the citizens are traders, and this place is distinguished by the fineness of its manufactures. As its territory is but small, it has but few places of note worthy of a particular description, besides its capital.

The city of Ragusa was built a considerable time before the birth of our Saviour, and was antiently called Epidaurus. It at length became a Roman colony, and in the third century was demolished by the Scythians. It stands in the peninsula of Sabioncello in the gulph of Venice, in the forty-second degree forty-eight minutes north latitude, and in the eighteenth degree forty minutes east longitude from London. Though it is not large it is well-built, and has some beautiful edifices. This city, which is the see of an archbishop, is defended by strong bulwarks, and the fortrefs of St. Nicholas secures its harbour against any hostile attempts. Its port, which is called Santa Croie, or the Holy Cross, is secured on one side by the little rocky island of Chiroma, which lies in the sea about half a mile distant, and the headland of the peninsula on the other: the latter is well fortified, and were the former so it would be impregnable. The city is surrounded with large suburbs, and has a garrison of about two hundred men; the burghers also keeping a constant guard.

The city of Gravosa is also situated on the peninsula of Sabioncello, and has the best harbour on all the coast. The entrance to it is very commodious, broad, deep, and well secured. It is ornamented with ravishing prospects of the adjacent mountains, which are covered with fine vineyards, gardens, and summer-houses, to which the Ragusans retire for the sake of pleasure.

There are also five small islands subject to the Ragusans, the principal of which is Melida, which some learned men suppose to be the island of Melita upon which St. Paul was shipwrecked; but this is not probable. It is about twenty-five miles in length, and abounds in oranges, citrons, wine, and fish. It has a small town of the same name, together with six villages and fine pastures.

C H A P. IX.

Of the GERMAN EMPIRE.

S E C T. I.

Of GERMANY in general.

Its Names, Situation, Extent, Climate, Mountains, Rivers, Woods, Fruit, Corn, and other Vegetables; Beasts, Birds, and Fishes; with the Produce of the Mineral Kingdom.

GERMANY, which is called by the French *Allemagne*, and by the natives themselves *Deutschland*, is bounded by France, the Netherlands, and the German sea on the west; by South Jutland and the Baltic on the north; by Polish Prussia, Poland, and Hungary on the east; and by the gulph of Venice, the dominions of the state of Venice and Swisserland on the south; extending from the forty-fifth degree four minutes to the fifty-fourth degree forty minutes north latitude, and from the sixth degree to the nineteenth degree forty-five minutes east longitude; and accordingly its greatest extent from north to south is six hundred and forty English miles in length, and five hundred and fifty in breadth.

Though Germany in general may be said to enjoy a temperate air, yet with respect to its purity, warmth, and healthfulness, it is very different; both from the southerly or northerly situation of the places of the country, from the proximity and distance of the sea, and from the difference of the soil. Thus the level parts enjoy a different air from the mountains, and the places where the soil is deep, moist, and marshy is different from the more elevated, dry, and sandy. Hence the produce of the trees, fields, and gardens ripen in different parts at different times.

Germany has many mountains, for Bohemia is principally environed with them; it is separated from Silesia by those called the *Riesengebirge*, and a still more considerable range of mountains parts Silesia and Moravia. In the very heart of Silesia are also many large mountains, and the countries in the circle of Austria are mostly mountainous. The Upper Palatinate has likewise many mountainous and hilly tracts, and the bishopric of *Salzburg* is also very mountainous. *Franconia*, both within the country and on its borders, has a considerable number of mountains; and in *Swabia* are large ranges of them, with many single ones. The Upper and Lower Rhine are also mountainous, and particularly the electorate of *Cologne*. In the circle of *Westphalia* are some mountainous tracts, and in Lower Saxony the *Hartz* are famous. In Upper Saxony are likewise many mountainous tracts; but the highest mountains in Germany do not exceed four thousand five hundred feet in height.

In several of the mountains are remarkable caverns and natural grottos, of which we shall give a description in their place.

The principal rivers in Germany are the *Danube*, the *Rhine*, the *Mayne*, the *Elbe*, the *Oder*, and the *Weser*.

This country was antiently very woody, and is still in general well provided with useful woods; but these are daily growing thinner, and in many parts timber is wanted for building and fuel. The German woods yield oak, beech, pine, white and red fir, limes, alder, ash, black poplar, larch, plane trees, chestnut trees, and olive trees; and for the cultivation of silk a great number of white mulberry trees are planted.

Germany is provided with all the necessaries and conveniencies of life; its soil indeed is not every where fertile, but the barrenness of one place is made up by the fruitfulness of another. Agriculture is here daily improving, and the lands are rendered more fertile, rich, and beautiful. It yields plenty of all kinds of grain, as common wheat, Turkey wheat, rye, spelt, barley, oats, peas, beans, vetches, lentils, chiches, millet, and buckwheat, of which it is able to export a vast quantity: manna

is also found there. The Germans likewise cultivate hops, anise, cummin, flax, hemp, tobacco, madder, woad, saffron, and bastard saffron, with truffles, potatoes, and a variety of excellent pot-herbs, fallads, and roots. They have likewise all sorts of common, French, and Italian fruits, as apples, pears, cherries, plumbs, chestnuts, almonds, olives, medlars, figs, peaches, apricots, oranges, lemons, citrons, grapes, nuts, filberts, walnuts, &c.

With respect to the cattle of Germany, there is a prodigious number of horses, cows, sheep, goats, and swine; the marsh lands in the dutchy of *Holstein*, *East Friesland*, and *Bremen* afford cheese and butter in the greatest plenty. The wild beasts are deer, roes, boars, hares, and rabbits; in some places are also bears, wolves, lynxes, foxes, wild cats, badgers, martens, wild goats, and chamois.

Of tame fowl they have plenty of poultry, turkies, pigeons, geese, and ducks; and of those that are wild, swans, bustards, pheasants, woodcocks, partridges, grouse, snipes, larks, fieldfares, ortolans, quails, wild-geese, wild-ducks, the spoonbill, and stork; also the falcon, heron, hawk, &c.

The numerous rivers, brooks, lakes, and ponds in Germany afford sturgeon, salmon, pike, carp, trout, lampreys, eel-pouts, eels, perch, roach, barbel, shads, and on the sea-coast are a great variety of sea-fish.

Of the mineral kingdom, here are many species of marble, some of one colour, and others variegated; alabaster, free-stone, many species of agate, cornelian, chalcedony, onyx, jasper; with various species of crystals and precious stones, as rubies, sapphires, topazes, emeralds, chrysolites, amethysts, granates, hyacinths, turquoises, and carbuncles. Here are likewise vitriol, allum, salt-petre, sal-gem, and spring salt, petroleum, coals, black amber, sulphur, quicksilver, and also virgin silver, arsenic, cobalt, antimony, bismuth, calamy, and mock-lead; and of metals, gold, silver, copper, and iron.

S E C T. II.

The Persons and Manners of the Germans in general. Their Skill in the Polite Arts, Manufactures, Commerce and Coins.

THE Germans are generally tall and well made, and it is easy to observe amongst them a remarkable difference with respect to their character, temper, and manner of life, which is an evident proof of their consisting of several distinct nations. They are, however, in general, very remarkable for their honesty and fairness in their dealings. Both the ancient and the present Germans have been long distinguished for their hospitality. *Julius Cæsar* observes, that in his time their houses were open to all men, who were welcome to such entertainment as they found provided. That they esteemed it a piece of injustice to affront a traveller, and thought it a necessary act of religion to protect those who came under their roof. The present Germans have not degenerated from their ancestors, and a stranger is sure to be every where well entertained. The courage and bravery both of the ancient and present Germans were never disputed. The Germans have also the honour of having almost all the kingdoms in Europe owe to German blood their crowned heads, particularly *Great-Britain* and *Ireland*, *Denmark*, and *Norway*, *Sweden*, *Poland*, *Hungary*, *Prussia*, *Bohemia*, and *Russia*.

With respect to learning, the Germans are not inferior to any other nations; for not only their natural fondness for imitation, but the variety of governments, their

their mutual emulation, and the freedom protestants enjoy of writing according to their own judgment, have procured the greatest improvement in the sciences. The pleasure they take in reading is so great, and general, particularly among the protestants, that it is thought unbecoming even the female sex, and persons of any rank, not to be conversant with books. Nor is there any place in the world where more books are written and printed; and though this gives rise to many mean performances, they have a great number of very excellent works; and there are at present many German authors justly esteemed for their genius and abilities.

As to the vices of the Germans, they have been censured for their drunkenness; but they do not seem to be more guilty of this vice than their northern neighbours, or indeed than the English: that there are persons of high rank there, as well as country squires among us, who will insist upon bumpers going round, and will glory in drinking deeper than their companions, cannot be disputed; but this is far from being a national vice; and both there and in Great-Britain it is less common than formerly.

Their drink is beer and wine, as with us; but they have the latter upon much easier terms; for they have not only Moselle, Rhenish, and other wines of their own growth; but those of Hungary, France, and Italy, which lie contiguous to them, where the best wines are produced.

Their ordinary food is beef, mutton, fowls, &c. as among us, which are generally more thoroughly boiled and roasted than in England. They have also one dish, which was esteemed a dainty by the ancient Romans, as it is by them, and that is snails, which are dressed in various manners, and eaten at the tables of the quality as a great rarity: they are fed for this purpose, so as to grow to an extraordinary size; and there is scarce a nobleman's garden that has not a place set apart for breeding and fattening them.

Among the other peculiarities, instead of the cheerful fire-side, which enlivens our winter evenings, they heat their rooms with stoves. And they not only sleep on a feather-bed as we do, but, instead of blankets, have a light feather-bed covering too; which is placed upon the upper sheet, and is covered with a counterpane.

Among the diversions practised by the great, is hunting the wild boar, and, in winter, riding through the streets on the snow, in sledges drawn by horses richly accoutred, and adorned with bells and feathers.

In Germany are thirty-six universities, seventeen of which belong to the protestants, and the same number to the Roman Catholics; with two other mixed ones, those of Erfurth and Heidelberg. They have also a number of academies for the sciences, and many colleges and schools. The Germans have particularly distinguished themselves by their knowledge in the civil law, natural history, and the various branches of philosophy.

The French had formerly the reputation of excelling all other nations in the polite arts; but at present they are nearly equalled by the Germans.

In the polite arts, they excel in music, and boast the works of Telemann, Handel, Graun, Bach, and Haffé. Some of their poets have excelled most of the European nations in the sublimity of their thoughts, and the mingled strength and sweetness of their language. With respect to painting, they claim the first place after the Italians, and justly boast their Peter Paul Rubens, John Calker, and several others. The first copper plates appeared in Germany; Albert Durer also etched in copper before the Italians; and metzotinto was discovered by Von Sichen, an Hessian lieutenant, in 1648, but others say by prince Rupert: wooden cuts were also the invention of a German. The first discovery of the art of printing cannot with justice be refused the Germans; and Berthold Schwartz, in the thirteenth century, discovered at Cologne how gunpowder might be made serviceable in the art of war.

With respect to mechanics and manufactures, the Germans at present make velvets, beautiful silks, rich stuffs, and half silks, with a variety of woollen stuffs, and all manner of cloths, ribbons, lace, very large

quantities of linen, fustian, embroidered work, fine hats, and tapestry; they also print cotton in a beautiful manner, make Spanish rough and smooth leather; and are well skilled in the art of dying. They work all sorts of metals for ornaments, vessels, tools, wire, &c. in the best manner; and Augsburg in particular is famous for its performances in silver. They are well skilled in the working of brass and arms. They make glass, and beautiful mirrors of all sizes; fine works in lacquer, and a variety of porcelain, among which the Misnian is said to be the finest in the world. In short, Nuremburg is famous for a variety of ingenious works in wood, ivory, metal, stone, glass, &c. which are exported to all parts of the earth.

With respect to commerce, Germany enjoys every advantage; for it not only borders on the German ocean, the Baltic, and the gulf of Venice, but is watered by many navigable rivers; and being situated in the heart of Europe, can commodiously export the superfluity of its home commodities and manufactures, and receive those of foreign countries.

About the middle of the thirteenth century, many towns in Germany, as well as in other countries lying on the German ocean and the Baltic, entered into a mutual league with each other for the promotion of trade and navigation, and were thence called Hanse towns. Though their trade fell to decay in the fifteenth century, and the name of the league in that time ceased, yet the trading towns of Hamburg, Lubec, and Bremen, are still called Hanse-Towns, and have a league actually subsisting between them, under the name of which they conclude treaties of commerce with foreign powers. Hamburg is the most important trading town in all Germany, and is chiefly indebted to navigation for its fame, as being the most resorted to by the English and Dutch of all the towns in Germany. The other principal trading towns are Francfort on the Mayne, Leipzig, Nuremburg, Augsburg, Vienna, Fiume, and Trieste, which last is a free port. Several towns have likewise the privilege of holding fairs; of these, Francfort on the Mayne has the greatest, and the next to it is Leipzig. The other fairs are kept at Francfort on the Oder, Naumburg, Brunswick, and Mentz.

The goods exported from Germany into the neighbouring and remote countries are corn, wine, particularly the Rhenish and Moselle, tobacco, horses, lean cattle, butter, cheese, honey, syrup, linen, woollen stuffs, yarn, ribbons, silk and cotton stuffs, wool, Nuremburg wares, wood of various sorts, particularly timber fit for ship-building, iron plates and stoves, cannon, ball, bombs, grenades, tin-plates, steel-work, copper, brass wire, porcelain, earthen ware, mirrors, glasses, beer, Brunswick mum, hogs bristles, tartar, smalt, zaffer, Prussian blue, printers ink, and many other articles.

With respect to the coins in Germany, it is proper to observe, that the emperor, with the electors, the chief part of the princes of the empire, several prelates, abbesses, counts, barons, some of the gentry, and the imperial cities, enjoy the privilege of coining money; but with this distinction, that some are entitled to coin only small money, others to coin also a larger species, and that either of silver alone, or of gold also. Yet many states of the empire, in order to save expences, seldom make use of this privilege. One or two days are appointed every year in each circle to be held by the mint masters for the examination of the coin; and the emperor has engaged that they shall be regularly held in every circle. All the money in the empire ought likewise to be coined of the same standard, and to be of one weight and intrinsic value: at present, by virtue of a resolution of the diet of 1737, this standard ought to be that of Leipzig; but neither this, nor the other regulations of the empire, with respect to coinage, have been able to prevent its debasement.

In Hamburg and Lubec they reckon by marks, shillings, and pfennings: one mark, which is one shilling and six pence sterling, makes sixteen shillings, one shilling twelve pfennings; but this pfenning is no real coin; forty-eight shillings, or three marks, make one rix-dollar. The current heavy money of this country is generally

rally twenty-five *per cent.* better than the light current coin of Germany.

In Bremen they reckon by rixdollars, grots, and schwars: one rixdollar worth four shillings and sixpence makes one and a half double, and three single Bremen marks, seventy-two grots, or three hundred and sixty schwars.

In Leipzig, and in all the electoral countries of Saxony, as also at Naumburg, Berlin, Magdeburg, and Francfort on the Oder, they reckon by rixdollars, gut-groschen and pfennings; that is, one rixdollar, which is there an imaginary coin, contains one imperial florin and a half, or twenty four gut-groschen; and one gut-groschen twelve pfennings. An imperial florin contains sixteen gut-groschen; a one third piece, eight groschen; and one sixth piece, four gut-groschen.

At Francfort on the Mayne they reckon in rixdollars, kreutzers, and pfennings: one rixdollar makes one florin and a half, four head-pieces and a half, twenty-two batzes and a half, thirty imperial grosches, and forty-five albus, or white pfennings.

At Nuremburg, Augsbourg, Vienna, Prague, &c. they reckon by imperial guldens, or florins, kreutzers, and pfennings: one imperial florin, or two-third piece, makes fifteen batzes, sixty kreutzers, twenty imperial grosches, or two hundred and forty pfennings.

In Breslau, and all Silesia, they reckon by rixdollars, silver groschen, and pfennings: one rix-dollar contains thirty imperial or silver grosches or bohms, forty-five white grosches, ninety kreutzers, an hundred and twenty grosches, an hundred and eighty dreyers, and three hundred and sixty pfennings.

In Brunswic, and many other places in Lower Saxony, as also in the whole circle of Westphalia, they reckon by rixdollars, marien-groschen, and also by gut-groschen and pfennings: one rixdollar makes twenty-four gut-groschen, thirty-six marien-groschen, or two hundred eighty-eight pfennings; one marien-grosche contains two matters, or eight pfennings.

At Cologne on the Rhine, they reckon by rixdollars, albus, and hellers; as also in esses, and pfennings Flemish: one rixdollar current makes one imperial florin and a half, four head-pieces and a half, forty-eight Brabant styvers, fifty-eight and a half Cleve styvers, seventy-eight albus, and an hundred and seventeen fetmanger.

It is observable, that the rixdollar which at Hamburg, Altena, Lubec, Bremen, &c. is worth four shillings and sixpence, goes in most parts of Germany for no more than three shillings and sixpence.

S E C T. III.

An Abstract of the ancient and modern History of the Germans.

THE Germans were, in the early ages of the world, divided into many petty nations and principalities, some governed by kings whose power was limited, and others were absolute; some of their princes were elective, and others hereditary; and some aristocratical and democratical governments were also found among them. Many of these states and kingdoms frequently united under one head or general, both in their offensive and defensive wars.

This was the state of the Germans before they were conquered by the Romans. At that time the children went naked, and the men hung the skin of some wild beast upon their shoulders, fastening it with a thong; and persons of the best quality wore only a little woollen mantle or a coat without sleeves. Their usual bed was the ground, a little straw, or the skins of wolves or bears. Their food was bread, flesh-meat, butter, and fruit, as at present, and their drink water, milk, and beer; for in those early ages they were strangers to the use of wine. They were usually very merry at their entertainments, sitting in a semi-circle, with the master of the family in the middle, and the rest on the right and left, according to their quality; but to these feasts no women were admitted, nor a son under twenty years of age.

They expressed an extraordinary regard for morality, and were very strict in divine worship, choosing their priests out of the nobility, who were not entirely ignorant of moral philosophy and physics, and were usually called to councils of state. Women were likewise admitted to the priestly office, and both the one and the other were treated with the most profound respect by the laity. The doctrine of transmigration then prevailed in Germany; they believed that departed souls, when they had left these bodies, animated other creatures; and, according as they behaved in this life, were happy or miserable. Cluverius observes, that they worshipped the sun with such devotion, that they seemed to acknowledge that planet as the supreme God, and to it dedicated the first day of the week. They also worshipped Woden, or Godan, after whom the fourth day of the week was called Wednesday. It is said that this word Godan becoming afterwards contracted into God, the Germans and English gave that name to the Deity. They also worshipped the god Faranes, the same with the Danish Thor, the Thunderer, from whom our Thursday has its name. The goddess Freia, or Venus, gave her name to Friday; and Tuisko, the same with Mars, gave name to Tuesday.

Like the antient Britons they performed their sacrifices in groves, the oak being usually chosen for an altar; and, instead of a temple, they erected an arbour made of the boughs of the oak and beech. The priests, as well as the sacrifice, were always crowned with wreaths of oak, or of some other sacred tree. They sacrificed not only beasts, but men; and these human sacrifices were taken from among their slaves or malefactors. Their belief that their souls should animate other bodies after death, it is said made them fearless of danger, and upon extraordinary occasions they made no scruple of dispatching themselves into the other world. They burnt their dead bodies, and having gathered up the bones and ashes of the funeral pile, buried them together; and at the funerals of the great were tiltings and songs, sung in memory of their heroic actions.

These were the manners of the Germans before they were subdued by the Romans, who met with such resistance, that they were contented with making the Rhine and the Danube the boundaries of their conquests; and accordingly built fortresses, and planted garrisons on the banks of both those rivers, to prevent the incursions of what they termed the barbarous nations: but within about a hundred years after Constantine the Great, the Franks, Burgundians, Alemans, and other German nations broke through those boundaries, passed the Rhine, and dispossessed the Romans of all Gaul, Rhætia, and Noricum, which they shared among them; but the Franks prevailing over the rest, at length established their empire over all Modern Germany, France, and Italy, under the conduct of Charlemagn, or Charles the Great.

The conquered German nations had at first hereditary dukes of their own, and were governed by their own laws; but Charles put an end to the former, and governed the countries by counts and royal missionaries. However, the antient diets were still retained. In the year 800, Charles revived and conferred the dignity of Roman emperor upon himself and family: but his son Lewis divided the empire among his sons; upon which great troubles arose, which, in 843, were adjusted by an accommodation; by which Lewis the German obtained all Germany as far as the Rhine, with the three towns of Spire, Worms, and Mentz; and thus Germany became an independent kingdom. In 870, Lewis reduced half of the Lotharingian kingdom under his subjection, and his son Lewis, the younger, nine years after reduced the other.

Lewis the Younger sharing his paternal kingdom with both his brothers, Carlman became king of Bavaria, Lewis of East Franconia, and Charles the Fat of Alemannia; the last surviving his brothers, not only inherited their kingdoms, but obtained the imperial dignity, together with all Italy and France: yet governed in so weak a manner, that in 887 he was deposed by the German states, who constituted Arnulph, Carlman's natural son, king of Germany. This prince beat the Normans, who had made great devastations in Germany; and, by the

the assistance of the Huns, subdued the Bohemians. But afterwards, by the death of his son Lewis the Child, his family became extinct. Germany was at that time an hereditary kingdom, but the power of its monarchs was limited by the diets. The several territories belonging to it were governed under the king by counts, among whom the margraves defended the borders against hostile attacks.

The German states now raised a Frankish lord, named Conrad, to the throne, he being descended from the daughter of Lewis the First. Conrad was succeeded by his enemy Henry duke of Saxony, whom on his death-bed he recommended to the states.

In Henry II. the male race of the Saxon kings and emperors ended in 1024, during which time Germany continued an hereditary kingdom. The states afterwards assembling at Tribus in the open fields on the banks of the Rhine, elected Conrad II. for their king, who being also acknowledged by the states of Italy, he likewise obtained the imperial dignity. By means of his son he annexed the kingdom of Burgundy to the empire, rendered Poland subject to his dominion, and in a treaty with Denmark appointed the Eider as the boundary of the German empire.

Henry III. deposed three popes who had set up against each other, appointing a fourth in their stead; since which time the vacancy of the papal chair has always been intimated to the emperor, who sends a person to Rome to desire that a new pope may be elected.

Henry IV. his son, was, however, put under the ban by the pope, on which he was deposed by the states.

Henry V. succeeded his father, but was obliged to renounce all pretensions to the investiture of bishoprics, which had been claimed by his ancestors; and in him became extinct the male line of the Frankish emperors.

Upon this the pope caused Lotharius, duke of Saxony, to be elected; but he was not acknowledged by all Germany for their sovereign, till after a ten years war. After him Conrad of Hohenstaufen succeeded to the crown. The emperor Frederic I. effectually exercised his sovereignty over the see of Rome, by virtue of his coronation at Arles, reserving also his dominion over that kingdom, and obliging Poland to pay him tribute, and take an oath of allegiance. Henry VI. attempted in vain to render the crown hereditary in his family. Philip, the brother of Henry, succeeded him; but refusing to acknowledge the pope's supremacy, was excommunicated, and Otho, duke of Brunswic, set up against him by the pope and the electors. The whole empire was engaged in this dispute in a bloody war, till Philip being treacherously assassinated in his bed, Otho became possessed of the whole empire; but he had not reigned four years, before he was deposed by the pope and the electors, and Frederic, king of Sicily, advanced to the imperial dignity.

Frederic II. whom historians extol for his learning, wisdom, and resolution, was five times excommunicated by three popes; but prevailed so far against pope Gregory IX. as to depose him from the papal chair. These continual contests between him and the popes gave rise to the two famous factions of the Guelphs and Gibellines; the former adhering to the papal see, and the latter to the emperors. Frederic having reigned thirty-eight years, died, or, as some say, was poisoned, in Italy; after which the empire remained in great confusion for upwards of twenty years, there being no less than six competitors for the imperial dignity.

Germany began to recover from its distracted state in 1273, when count Rodolphus of Hapsburg was advanced to the imperial dignity, the other electors leaving the choice to the palgrave Lewis; and from him the house of Austria sprung.

Count Adolphus of Nassau was also, by virtue of a compromise, created emperor by the elector of Mentz; but he so disgusted the electors of the empire, that they made choice of Albert the son of Rodolphus for their sovereign, who defeated Adolphus in a pitched battle, and slew him with his own hand. Albert's coronation was confirmed by the pope; but he was afterwards murdered by his nephew and three assassins.

On the death of Albert, in 1308, Henry, count of Lutzelburg, was created emperor: he was famed for his wisdom, temper, and courage; but was poisoned by a Franciscan friar with the consecrated elements. The emperor no sooner perceived what was done, than he generously advised the villain to make his escape; but neglecting to perform it, he was taken and flayed alive.

Ludowic, or Lewis of Bavaria, after an interregnum of some years, was chosen emperor, by a majority of the electors, in 1318; but Frederic, duke of Austria, son of the late emperor, was set up by a contrary faction. Frederic's forces were defeated, and Lewis remained sole emperor. After his death Charles IV. was unanimously elected emperor, and distinguished himself by drawing up the golden bull, or those regulations for the election of an emperor, which are still observed. Charles lived to see his son Wenzel, or Wenceslaus, elected king of the Romans. This prince, who was the fourth son of Charles, at his father's desire, succeeded to the empire; but, being dissolute and cruel, was deposed, after he had reigned twenty-two years.

Charles was succeeded by three other princes, whose reigns were short; and at length, in 1411, Sigismund was unanimously chosen emperor, who, in 1414, proclaimed a general council to be held at Constance, in which three popes were deposed, and a new one set up. At this council those reformers John Hufs and Jerom of Prague were condemned and burnt, though this emperor had granted them a passport, and was engaged in honour and conscience for their safe return to their country; which so exasperated the Hussites of Bohemia, that they raised a formidable army, and, under the conduct of Zisca, their general, defeated his forces in fourteen battles. Frederic, duke of Austria, son-in-law to the emperor Sigismund, was chosen emperor upon the death of his father, and reigned fifty-three years. His son Maximilian was chosen king of the Romans during his father's life-time, and afterwards obtained from the pope the imperial crown; and during his reign the empire was divided into ten circles.

Charles V. surnamed the Great, son to Philip king of Spain, and grand-son to Maximilian, was elected emperor in 1519. He procured Luther's doctrine to be condemned, and in his reign the disciples of that great reformer obtained the name of Protestants, from their protesting against a decree of the imperial diet in favour of the Catholics. He is said to have been victorious in seventy battles: he had the pope and French king prisoners at the same time, and carried his arms into Africa, where he conquered the kingdom of Tunis. He drove the Turks from the siege of Vienna, made war on the protestant princes, and took the elector of Saxony and the prince of Hesse prisoners; but, after a reign of thirty-eight years, he resigned his empire to his brother Ferdinand, and retired into a convent in Spain.

Ferdinand I. distinguished himself by establishing the aulic council of the empire: he was a peaceful prince, and used to assign a part of the day to hear the complaints of his people. Maximilian II. and his son Rodolphus II. were both elected king of the Romans, but the latter could not be prevailed upon to allow a successor to be chosen in his life-time. He was succeeded by his brother Matthias, in whose capitulation it was for the first time inserted, that the electors for the future should be entitled to elect a king of the Romans even against the will of his father.

In the reign of Ferdinand II. broke out the thirty years war, in which he endeavoured to destroy the Protestants, and which was put an end to by his son Ferdinand III. in the year 1648, by the peace of Westphalia, by which the Protestants were secured in their religious and civil privileges. This emperor conferred on duke Ernest Augustus of Brunswic Lunenburg the ninth electoral dignity, and was succeeded by his son Joseph, king of the Romans. This last was followed by his brother Charles VI. who in the year 1713 published the ordinance called the pragmatic sanction, to secure his hereditary dominions in his family, and died in 1740, without male heirs. In 1742 Charles VII. of Bavaria was chosen emperor, by the suspension of the vote of Bohemia; but, after an un-

happy reign, in which he was continually at war, he died in 1745, and was succeeded by Francis I. grand duke of Tuscany, and duke of Lorrain, who had married the queen of Bohemia, the daughter of Charles VI.

SECT. IV.

Of the Election and Coronation of the Emperor; his Power, and the Power and Privileges of the States of the Empire and the Diet.

THE empire is elective, and every new king of the Romans is obliged solemnly to renounce all attempts of rendering it hereditary in his family. The laws of the empire make no limitation with respect to religion, nation, state, or age. The choice is settled by the majority of the electors, and declared by the elector of Mentz, within a month after an account is received of the former emperor's death, by means of envoys and public rescripts to each elector. The ceremony of election is performed at Frankfort on the Mayne; where the electors appear, either in person, or send two or three envoys, who must be provided with sufficient powers. After settling the deliberations, as well relating to the capitulation of election, as to other matters proposed by the states, foreign envoys, and others, all the foreigners who do not belong to the retinue of the electors, or their envoys, are ordered to leave the town before the day of election; after which all the electors present, with the first envoys of such as are absent, march in their electoral habits in procession on horseback, the three ecclesiastical electors wearing scarlet robes, with caps lined with ermine, and the robes of the secular electors of crimson velvet lined also with ermine, each with his hereditary marshal carrying a sword in a scabbard before him; but this honour is not paid to the deputies of the absent electors. In this manner they proceed from the council-house to St. Bartholomew's church, where alighting at the gate, they go to their respective seats in the choir, followed by several princes and counts of the empire, the several sword-bearers standing before their respective electors, with their swords drawn and laid on their shoulders. The service begins with *Veni Creator*, and the Protestant electors withdraw till mass is over; after which they return, and they all solemnly take an oath before the altar, to elect the fittest person to be emperor, and then shut themselves up in the chapel of election, which is a small vaulted gallery, to which there is an entrance from the choir. When they have once more sworn to stand to a plurality of votes, these votes are collected by the elector of Mentz, according to the rank of the electors; and then the elector of Mentz is asked by the elector of Saxony for his vote. Whoever has above half the voices of the college is elected, and an elector may even vote for himself.

The election being over, the person elected, or his proxy, must immediately swear and subscribe to the capitulation of election, which being done, he receives the congratulations of the electors, and the choice is made public in the church. If the elected king of the Romans be not present in person, he must give a counter-bond that he will maintain the capitulation of election, and, before his coronation, must swear to it in person; and, till this is done, he cannot assume the government, but must leave it to the vicars of the empire. An authentic copy of the capitulation of election, subscribed by the person elected, or his envoy, and confirmed by his seal, is delivered to each of the electors; and, on the other hand, the electoral college causes to be delivered to the person elected an instrument of his election, which, when he is absent, is carried to him by a prince, with a writing of notification. Upon this he appoints a day for his coronation, which ought to be performed at Aix la Chapelle, but at present is always held in the town of election.

Part of the jewels of the empire are kept at Aix, and part at Nuremberg. Most of them belonged to Charlemagne, and are solemnly delivered up at the place of coronation. Exclusive of several kinds of vestments, there are the crown and sceptre, with two rings, one imperial monde, two broad swords, one small one, a book of the gospels, &c.

At the coronation the temporal electors, or their ambassadors, attend the person elected from his palace to the church, in the following order; the elector Palatine with the crown, the elector of Bavaria with the monde, or globe, and the elector of Brandenburg with the sceptre, march first, abreast; the elector of Saxony carries the sword, and the elector of Hanover the standard. At the door of the church he is received by the three ecclesiastical electors in their robes, who attend him to the altar; and having taken a general oath as a ruler, and also promised due veneration to the pope and the church, the archbishop who officiates, anoints his head, and between his shoulders, his neck, breast, and right arm; then being clothed in the ancient imperial robes, he is brought to another altar, and once more sworn; he is then crowned, and afterwards conducted to the throne, where the archbishop bids him receive and keep the pledge which was designed for him by Providence. *Te Deum* is then sung, and the trumpets and other music proclaim the general joy. After which he dubs some knights, is made a canon of the collegiate church of St. Mary at Aix la Chapelle, and is then conducted on foot, in solemn procession, to the council-house to a table, at which the hereditary officers attend.

Till the reign of Charles V. the emperors suffered themselves to be crowned at Rome by the pope, and then styled themselves Roman emperors. The emperor, immediately on his entering on the government, shews his veneration to the pope by an embassy. The title of king of Italy and Lombardy, if we except twenty-one fiefs of the empire, that lie in the ecclesiastical state, is merely titular.

The emperor's title runs thus, "F. by the grace of God elected a Roman emperor, and at all times augmentor of the empire of Germany." Next follow the titles of the hereditary imperial dominions. The states of the empire give the emperor the title of most illustrious, most powerful, and most invincible Roman emperor; but the last is omitted by the electors.

The arms of the emperor and empire are a black spread eagle with two heads, hovering with expanded wings in a field of gold, and over the head of the eagle is seen the imperial crown. To these are annexed the arms of the several hereditary countries.

The prerogatives of the emperor consist partly in his being looked upon by all other crowned heads and states in Europe as the first European potentate, and consequently has precedence given him and his ambassadors. With respect to the German empire, he is its supreme head, and as such enjoys many privileges. Yet his power in the administration of the German empire is limited both by the capitulation of the election, the other laws of the empire, by treaties, and by the customs of the empire. Those privileges which he has the right of exercising without the advice of the states, are called his *reservata*; but his greatest power does not consist in these, which are far from being repugnant to the liberties of the states of the empire.

His rights, with respect to ecclesiastical affairs, consist in little more than confirming ecclesiastical elections, and sending commissaries to the elections of archbishops, bishops, and abbots, that they may be performed in due order; but the commissary is never personally present at these elections.

With respect to temporal affairs, the emperor has the right of bestowing personal dignities; as for instance, the creating of noblemen, as lords, barons, counts, who enjoy the dignity of princes, and of knights and gentry; as also that of raising countries and territories to a higher rank; of bestowing coats of arms, as also the enlarging, improving, and altering them. He has the power of establishing universities, and enabling them to confer academical degrees; of granting a right of holding fairs and markets, and of erecting any place into a sanctuary. He has likewise the power of bestowing letters of respite, of securing a debtor against his creditor, and of conferring majority on minors. He can put children who are born out of wedlock upon the footing of such as are legitimate; can confirm the contracts and stipulations of the members of the empire; and so far remit the oaths extorted from them, that they may com-

commence an action at law against another, on account of the very thing for which the oath was administered.

The emperor, however, has no right, without the consent of the collective states of the empire, to put one of those states under the ban; to exclude a state of the empire from a seat and voice in its colleges; to interfere in the laws of the empire; to conclude treaties in affairs relating to the empire; to involve it in a war; to raise levies; or to conclude a peace in which the empire is concerned; to appoint taxes in it; to regulate the coinage; to build forts in the empire; or to determine religious disputes.

The successor in the administration is frequently chosen by the electors during the life of the emperor, and the person so chosen styled King of the Romans. He is elected and crowned in the very same manner as the emperor; and though he has properly no kingdom, is actually a crowned head; is saluted with the title of Majesty, and enjoys the title of *Perpetual Augmenter of the empire*, and king of Germany. He bears a spread eagle with one head, in his arms, and takes precedence before all other kings of Christendom.

With respect to the emperor's court and chancery, he has for his assistants the arch-offices of the empire, which are filled by electors.

Of the nine electors, three are spiritual, and the rest temporal; of the former is the elector of Mentz, who is arch-chancellor of the holy Roman empire, and director of the electoral college: this prince, besides the offices he enjoys at the coronation, as already mentioned, has the general direction, and is not to be controuled by the emperor; he lays before that body the grievances of the separate states. Before him, or his envoys, all those of the states of the empire, as well as of foreign powers, legitimate themselves. He nominates the vice-chancellor of the empire, who must take an oath to him as well as the emperor. He likewise appoints all officers for the chancery of the empire, and has supreme jurisdiction over them, and also the inspection of the archives of the empire.

The elector of Treves, who is the second spiritual elector, is the arch-chancellor of the holy Roman empire in Gaul and the kingdom of Arles, but this is at present no more than a mere title. He has the first voice at the election of a king of the Romans, and constantly precedes the elector of Cologne.

The elector of Cologne is arch-chancellor of the holy Roman empire in Italy, and has a second voice at the election of a king of the Romans. When the emperor is crowned at Aix-la-Chapelle, and in the archbishopric of Cologne, he has the right of performing the coronation alone; but if it happen in a third place, that is neither in his archbishopric, nor in that of Mentz, he exchanges therein with the elector of Mentz.

The temporal electors are the following: The king of Bohemia, the elector of Bavaria, the elector of Saxony, the elector of Brandenburg, the elector Palatine, and the elector of Hanover.

The king and elector of Bohemia is arch-cup-bearer of the holy Roman empire, and as such, presents to the emperor the chalice, filled with wine and water, and hands the first liquor to the table in a silver cup, which weighs twelve marks, or about ninety-six ounces English, which afterwards, together with the horse, becomes the property of his vicar. His other prerogatives are, his preceding all other temporal electors, walking in procession immediately after the emperor, followed by the empress, and the electors of Mentz and Cologne; and in the electoral college he has a third voice.

The elector of Bavaria is arch-sewer of the holy Roman empire. At the coronation he carries the monde before the emperor, ranks next to Bohemia, and at the imperial coronation places four silver dishes, weighing twelve marks, on the imperial table, and serves up the first course.

The elector of Saxony is arch-marshal of the holy Roman empire. At the diets, and on other solemn occasions, he carries the sword of state before the emperor, and at the coronation rides into a heap of oats, and fills a silver measure with them. At the diets he appoints

quarters for the electors, or their envoys; and during the holding of the diets, has jurisdiction over all electoral, and other officers of the empire.

The elector of Brandenburg is arch-chamberlain of the empire, and carries the scepter before the emperor, and presents him with water in a silver basin, for him to wash his hands.

The elector Palatine has the office of arch-treasurer, and throughout all Germany is protector of the order of St. John; he can also raise nobles and gentlemen to the degree of counts.

The elector of Bavaria being put under the ban of the empire, and the Palatine obtaining the office of arch-sewer, the elector of Brunswick Lunenburg also obtained the office of arch-treasurer, a title which he still bears, till another suitable office be found him. He enjoys the alternate succession of the bishopric of Osnaburg, with some other rights and privileges; and his electoral jurisdiction extends both to the territories of Hanover and Zell. Indeed, the emperor Leopold raised the illustrious house of Hanover, on account of the extraordinary services both he and the empire had received from it, to the electoral dignity, so early as the year 1692; but those electors obtained neither a seat nor a voice in the electoral college till the year 1708.

After these follow in rank the princes of the empire, who are partly spiritual, and partly temporal; partly old, and partly new; or first raised to that dignity since the reign of Ferdinand II. The spiritual princes are either archbishops, bishops, or princely abbots; and to them likewise belong the Teutonic masters, together with the mastership of the order of St. John. Among the temporal princes is an arch-duke, and the rest are either dukes, palgraves, margraves, landgraves, burgraves, princes, or princely counts. In the college, or council of the princes of the empire, are three benches: on what is called the spiritual bench, sit the spiritual princes, with the arch-duke of Austria, and that of Burgundy, but in such a manner that Austria daily exchanges the first place with Saltzburg: on the temporal bench sit the other temporal princes; and on the cross bench the bishops of Lubec and Osnaburg, when the latter happens to be a Lutheran.

The diet of the empire is an assembly of the emperor, and of all the states, or their envoys and plenipotentiaries, in order to consult and take resolutions in such affairs as concern the whole German empire. The diet is summoned by the emperor, who, after consulting with the electors, appoints the time and place where it shall meet, which must be within the German dominions. The summons consists of printed patents subscribed by the emperor, and sent in the form of a letter to each state of the empire, briefly declaring the occasion of their meeting, and the most important matters to be transacted. The emperor either assists at it in person, or has a principal commissary, who is generally an old imperial aulic counsellor, and a person of learning raised to the dignity of a baron.

The respective states may either appear themselves, or by their envoys, or charge another state, or its envoys, with their voice. On the side of the states the elector of Mentz, or his envoys, has the general direction; and these envoys shew their credentials to the elector of Mentz, or his envoys, and to the imperial principal commissary.

The states of the empire, in their consultations, divide into three colleges, the electoral, the princely, and the college of the imperial cities; each of the two first, which are called the higher colleges of the empire, has a principal and by-chamber of its own; but all the three colleges meet to hear the imperial proposals, and at the exchanging of the conclusions of both the higher colleges against the imperial cities, in the hall of correlatives.

It ought not to be omitted, that the ecclesiastical and secular princes of the empire, and all prelates who have princely dignities annexed to their functions, with the master of the Teutonic order, have each one single voice; but the rest, who have no temporal principality, give their voices by companies, of which kind are the two benches of the Rhine and Swabia. The representatives,

or the deputies of the imperial cities, form the last and third rank of members in the diet, and are also divided into the Rhenish and Swabian benches. On the first sit the representatives of Lubec, the free cities upon the Rhine, which amount to fifteen; and on the other the representatives of the thirty-seven free cities in Swabia and Franconia. The representatives of the city where the diet is held sit at a table by themselves, and take an account of the voices of the other deputies, which are registered by the two registers of Ulm and Spire, one of them representing the cities in the circle of the Rhine, and the other the cities in the circle of Swabia.

In each college the resolutions are formed by a majority of voices; but when affairs relating to religion are discussed, or where all the Catholics are of one opinion, and all the Protestants of another, it does not turn on a majority of voices.

If the three colleges be unanimous, a judgment of the empire is formed for the use of the emperor, or his principal commissary; but if only two of the colleges are unanimous, their resolution, with the particular conclusion of the third, is delivered into the imperial commission. When the emperor approves either of the judgment of the empire, or the conclusion of two colleges, an obligatory conclusion of the empire arises out of it, and it is immediately put into execution.

SECT. V.

Of the Forces, Taxes, Courts of Justice, and Laws of the Empire.

TAXES and other imposts can no otherwise be laid on the empire in general by the emperor, than with the advice, privity, and consent of the electors, princes, and states, at the general diets. These taxes are partly ordinary, and partly extraordinary: the former, which are styled the chamber-terms, are what each state of the empire is annually to contribute for maintaining the chamber-judicatory of the emperor and empire; and the proportion paid by each state is expressed in the matricula of the chamber. But these chamber-terms are so ill paid, that in 1753 the empire was indebted to the chamber-judicature six hundred and fifty-four thousand and thirteen rixdollars. Indeed many complaints have been made, that the matricula is imperfect, and the states not proportionably rated.

The extraordinary taxes are such as are frequently granted, in case of necessity, by the states, for the support of the emperor, or the army of the empire; for the maintenance or building of its forts; and for a war, particularly against the Turks. These are granted according to what is called in Germany Roman months; a denomination which took its rise from this circumstance: in antient times the emperors, in order to receive the papal coronation, took a journey to Rome, and the German states of the empire were bound to escort them with a certain number of horse and foot for six months, at their own expence; or to pay twelve florins monthly for a horseman, and four for a footman; which money obtained the name of Roman months. This foot, or standard, was afterwards retained, and the rate of each state, either in men or money, is settled in what is termed the matricula of the empire. A Roman month ought to bring in fifty-eight thousand two hundred and eighty florins.

The emperor is not to commence a war of the empire, without the consent of the electors, princes, and states, obtained in an open diet. But when the empire resolves upon a war, the generality of the empire, with the field-marshal at the head, and also the directors and counsellors of the military council, are to be nominated by the emperor and the whole body of the states; and those to an equal number of both religions, who, together with the whole army, are subject to the emperor and empire. The war must also be carried on agreeably to the ordinances of the empire; and the oldest field-marshal, without distinction of religion, must command the army. But at present no directors of the military council are any longer called in, and the war is generally managed by the emperor and his aulic military council.

With respect to the forces which the several princes of the empire are able to maintain and pay, the following calculation has been made:

The elector of Mentz can maintain	- - -	6000
The elector of Triers	- - -	6000
The elector of Cologne	- - -	6000
The bishop of Munster	- - -	8000
The bishop of Liege	- - -	8000
The archbishop of Saltzburg	- - -	8000
The bishop of Wirtzburg	- - -	2000
The bishop of Bamberg	- - -	5000
The bishop of Paderborn	- - -	3000
The bishop of Osnaburg	- - -	2500
The abbot of Fulda	- - -	6000
The other bishoprics of the empire	- - -	6000
The abbies and provostships of the empire	- - -	8000

Total of the ecclesiastical princes 74,500

The emperor for Hungary	- - -	30,000
For Bohemia, Silesia, and Moravia	- - -	30,000
For Austria, and his other dominions	- - -	30,000
The king of Prussia, as elector of Brandenburg	- - -	40,000
The elector of Saxony	- - -	25,000
The elector Palatine	- - -	15,000
The duke of Wirtemberg	- - -	15,000
The Landgrave of Hesse Cassel	- - -	15,000
The prince of Baden	- - -	10,000
The elector of Hanover	- - -	30,000
The duke of Holstein	- - -	12,000
The duke of Mecklenburg	- - -	15,000
The princes of Anhalt	- - -	6000
The prince of Lawenburg	- - -	6000
The elector of Bavaria	- - -	30,000
The dukes of Saxony	- - -	10,000
The princes of Nassau	- - -	10,000
The other princes and imperial towns	- - -	50,000

The secular princes - - - 379,000
The ecclesiastical princes - - - 74,500

453,500

But of the body of men which the empire unanimously agree to send, and promise to supply, one-half seldom actually appear in the field.

With respect to the courts of justice, the principal is the imperial aulic council, which is held at the imperial court, and solely depends on the emperor, who is supreme head and judge, to whom in all matters of importance a judgment is exhibited by the imperial aulic council. This judicatory consists of a president, the imperial aulic vice-chancellor, a vice-president, and a number of imperial aulic counsellors, six of whom are always to be Lutherans; besides these are two secretaries, and a fiscal of the empire. To this class also belong the agents of the imperial aulic council, who give in the writings, urge the resolutions, &c.

The imperial and chamber judicatory of the empire, which is filled by the emperor and states of the empire at the same time, but maintained only by the latter, is at present held in the imperial city of Wetzlar. This judicatory consists of a chamber judge, two presidents of the chamber judicatory, one of whom is a Roman, and the other a Lutheran; as also of seventeen assessors, eight of whom are Lutheran, and nine catholic. To this court also belong a general and advocate fiscal, with thirty procurators, and a number of advocates. The chamber judicatory has also a chancery of its own, and a treasury, and has the direction of the chamber-terms of payment.

The other judicatories are called peculiar or lower, and to these belong the imperial land judicatory in Upper and Lower Swabia, held in the three imperial cities of Ravensburg, Wangen, and Isny, and in the borough of Altdorf, together with the imperial land judicatory of the burgraviate of Nuremberg, which belongs to the margrave of Brandenburg, and is held at Anspach, and many others, particularly the imperial aulic judicatory of Rotweil, which solely depends on the emperor, and is the principal of the lower judicatories of the empire.

The

The civil law is generally observed in all courts of the empire, and to this are added some decrees, to which an equal regard is paid; as first, the golden bull, already mentioned, which has only about twenty-four leaves, and was published by Charles IV. with the approbation of most of the princes, counts, barons, and other states of the empire, and contains all the fundamental laws relating to the election of the emperor, and the privileges of the electors: the seal annexed to this decree being of gold, it obtained the name of the Golden Bull, or edict, and is esteemed irrevocable. Another considerable part of the municipal laws of the empire is the *Capitulatio Cæsarea*, which is a collection of forty or fifty articles between the electors and the emperor; who, at his coronation, swears to maintain the privileges of the electors, princes, and other subjects of the empire; that he will not alienate or diminish the revenues of the crown, or bring foreign troops into the empire, without the consent of the states. The third kind of laws by which the Germans are governed are, the acts of their general diets. These laws indeed relate chiefly to the great, whose privileges they ascertain and secure; but every distinct state is governed by its prince or sovereign, either according to a set of laws formed by him or his ancestors, or his arbitrary pleasure.

S E C T. VI.

Of the State of Religion in Germany.

THE Germans became acquainted with some principles of the Christian religion, towards the close of the seventh century, by the Irish bishop Kilian, Suidbert and Ewald, who were Englishmen, and Ruprecht, of Worms, who settled at Saltzburg; and in the eighth century, Winifred, of England, preaching among the Thuringians, Hessians, and Saxons, was ordained bishop of the Germans beyond the Rhine, by the name of Bonifacius; he was afterwards made archbishop of Germany, when, under the specious pretence of propagating the doctrines of Christianity, he exerted himself with great zeal in promoting obedience to the church of Rome, and even employed the secular power against such bishops and priests as refused to submit to the Romish yoke and ceremonies of worship. Charlemagne propagated Christianity among the Saxons by fire and sword; and some time after, the Bohemians and Moravians were also brought to embrace the Christian religion.

The reformation began in Germany about the year 1517; for the archbishop of Mentz being unable to pay the large sums the pope expected from him, procured leave of his holiness to sell his pardons and indulgencies in all the great towns of Germany. Dr. Martin Luther, hearing of this, protested against the proceeding, and openly disputed at Wittemberg and Leipzig against those who asserted the power of the pope to grant pardons and indulgences, notwithstanding his being threatened with excommunication, and with being condemned as an heretic; but the elector of Saxony approving of his doctrines, he boldly propagated them in other parts of Germany, where the dukes of Brunswic and Lunenburg, Wirtemberg, Mecklenburg, Pomerania, the marquis of Brandenburg, the landgrave of Hesse, and the inhabitants of most of the imperial cities, became his disciples, and, in 1529, protested against the conclusion of the diet at Spire, by which all innovations in religion, till the decree of a future council should be obtained, were declared unlawful; and from this protest they received the name of Protestants; and from their confession of faith, which the following year they solemnly delivered to the diet at Augsberg, they obtained the name of Adherers to the Augsberg Confession. They took no part in the council of Trent; but the year before, that is in 1537, at an assembly at Smalkald, they set forth the substance of their doctrine in certain articles, in order to deliver them to the assembled bishops. Afterwards refusing to recede from the opinions they had professed, the emperor Charles V. endeavoured to reduce them by force; but after a long war, which broke out in the

year 1546, he granted them a toleration at Passau in 1552, which was afterwards confirmed to them at Augsberg in 1555, during the recess of the diet of the empire. By this peace, all the adherents to the Augsberg confession were confirmed in their full religious liberty, till a final agreement concerning both religions should be brought about, and in case that could not be effected, for ever. To the maintaining of this important law of the empire, the emperors and popish powers have frequently bound themselves by new obligations; and the former in particular have always confirmed it by oath in their capitulation of election; and the doubts that arose upon it were removed in the year 1648, by the treaty of Westphalia.

By virtue of this renewed and confirmed religious peace, no other religion, but that of the Roman, Lutheran, and reformed, is to be tolerated in the empire; yet there are sects that adhere to neither of these three religions, and yet in some places enjoy the free exercise of their own. The determination whether a person be a member of this or that church, belongs only to that very church; and each sovereign, or lord, is bound to allow his own vassals and subjects who are of another religion, not only the public and private exercise of theirs, but every thing belonging to it, as churches, schools, spiritualities, incomes, consistories, &c. in the same manner as they stood on the first of January, 1624: but in a country where there are subjects who adhere to one religion, which in that year was neither publicly nor privately observed, it lies in the sovereign's breast whether he shall suffer them in his country or not. If he enters into a stipulation with them, and promises them a toleration, it must be maintained, not only by him, but by his successors; for the rights of such subjects must not be infringed. But if he will grant no toleration, he must allow those who at the time of the treaty of Westphalia were already settled in his country, five years at least; and those who afterwards came to settle therein, or have made any change in their religion, at least three years. However, these regulations have in later times been repeatedly infringed.

Each protestant state may make what regulations and changes it pleases within its own jurisdiction in matters relating to the churches or schools. Hence the external forms differ greatly in the protestant countries of the empire. The sovereign commonly decides all important affairs, settles and establishes, removes, promotes, cashier, or otherwise punishes such as serve either in the church or schools: he forms ecclesiastical regulations, appoints feasts and fasts, and erects colleges, which in his name superintend the other affairs of the church. Consistories are also generally appointed by the protestant states, which for the most part consist of lay and ecclesiastical counsellors; but in some places more, and in others fewer things fall under their notice. In many places also peculiar synods and a church council are held. Those that serve the church and schools are either appointed by the sovereign of the country, or the consistory, the elders of the church, or its members. These also appoint inspectors, provosts, or superintendents; and general superintendents are frequently placed over these.

The power of the protestant states over their catholic subjects is the same with that which the catholic states have over their protestant subjects. In favour too of those, who in the year 1624 enjoyed the public exercise of their religion, it is provided, that the catholic bishops in whose district they belong, shall retain the same spiritual jurisdiction over them as far as in that period: consequently, such as were merely tolerated out of grace or favour, are also wholly left in this particular to the supreme jurisdiction of the lord of the country; but with this limitation, that he can require nothing of them which is contrary to the principles of their church. On the other hand, no cloister situated in the territory of any protestant superior, or lord, must be converted into any other order, unless the former order be wholly extinct; and even in that case, the cloister is to be supplied only with such regulars as had a being as an order, prior to the religious dissensions.

In short, the protestant body has mutually agreed, that whenever, for the future, a Lutheran lord of a country shall

shall turn to the reformed or Calvinist church, or obtain a country annexed to it, and *vice versa*, in that case he shall leave his subjects the free exercise of their religion, their whole form of church and school discipline, and all their other privileges. But if a church shall of itself turn to that of the lord of the country, the public exercise of religion shall be permitted the people; but at their own expence, and without prejudice to the others. The consistorial counsellor, superintendents of divinity and philosophy are to be of the religion that prevailed in the country at the conclusion of the treaty of Westphalia.

S E C T. VII.

Of the Circles into which the German Empire is divided, and the Italian Fiefs subject to the Emperor and the Empire.

GERMANY is divided into ten circles, in order to promote and maintain the internal peace and security of the empire, and the better to repel hostile violence; this is also done for the better examination and disposal of whatever regards the public welfare; for the more just division and collection of the aids granted by the empire, either in men or money; and for preventing and remedying the disorders in the taxes, coinage, &c. The circles have, however, no particular regulations with respect to precedence, but are very differently ranked in the ordinances and acts of the empire. But if we consider the rank of the assessors of the chamber-judiciary, and the regulations stipulated between some of them, they will appear in the following order, viz. the Austrian, the Burgundian, the Electoral Rhenish, the Franconian, the Swabian, the Upper Rhenish, the Lower Rhenish Westphalian, the Upper and Lower Saxon. But this division of the circles is imperfect, it not including all the dominions of the German empire; for Bohemia, Moravia, the Lusatias, and the Silesias, are not comprized within them; nor was a sufficient regard paid to the situation of the countries; for a part of the territories belonging to the Austrian circle lies scattered over all Swabia, and some countries of the Upper Rhenish lie also therein, though they might with more propriety be added to the circle of Swabia.

With respect to religion, the circles are divided into those that are entirely popish, as the Austrian and Burgundian; into such as are wholly protestant, which are those of Upper and Lower Saxony; and into the mixed, to which all the others belong.

The French wars have frequently occasioned an association of the four circles that lie nearest the Rhine, for their common defence, as well as that of the empire.

It will be proper just to mention here the fiefs belonging to the emperor and the empire in Italy, which the emperor in the last capitulation of election promised to preserve. These fiefs are at the imperial court divided,

1. Into those of Lombardy, of which there are thirteen; and among them the duchies of Milan, Mantua, and Montferrat; together with all the principalities of the house of Gonzaga, and the principality of Mirandola.

2. The Ligurian, of which there are nineteen, the chief of which are possessed by the princes of Doria.

3. The Bononian, of which there are twenty, among which are the dukes of Modena and Ferrara, with the princes Spinola, Doria, &c.

4. The Tuscan, of which there are ten, and among them are the grand duchy of Tuscany or Florence, Piombino, Soramo, Comacchio, &c.

5. The Tirnifani, of which there eleven, and among them the princes of Massa, Malaspina, &c.

We shall defer giving any account of these princes till we come to treat of Italy, to which they properly belong; and shall now proceed to the circles and other divisions of Germany; beginning with Austria, which is bounded on the south and east by the countries we have just laid before our readers, and deserves to be first mentioned on account of its containing the capital of the whole German empire.

S E C T. VIII.

Of A U S T R I A.

Its Situation, Climate, Rivers, Mountains, Produce, and Face of the Country. Its Royal Towns, the Language spoke by the People, and its Government. With a concise Account of the Sciences, Arts, Manufactures, and Trade.

THE circle of Austria borders to the north on Moravia, Bohemia, and the circle of Bavaria; to the east on Croatia and Hungary; to the south on Croatia, the Adriatic Sea, and the territory of the Republic of Venice; and to the west on Switzerland. The countries distinguished by Hither Austria are scattered in and about Swabia, and all the territories within this circle amount to about two thousand and twenty-five German square miles; so that this appears to be the largest of them all. It takes its name from the archduchy of Austria, which constitutes the principal part of the circle, and also contains the provinces of Austria Proper, Stiria, Carinthia, Carniola, Tyrol, Trent, and Brixen.

The archduchy of Austria is in general divided into two parts of very different extent. The larger tract, called Lower Austria, forms the easterly part of the country, and the smaller one, named Upper Austria, constitutes the westerly.

The air of Lower Austria would be very unhealthy, was it not purified by strong gales of wind. It is principally level, and the highest and most numerous mountains it contains are towards Stiria.

The country is fertile, and yields such plenty of corn, that the inhabitants are able to dispose of considerable quantities to their neighbours. In a few places they also cultivate mustard, calamus, saffron, and, particularly towards Hungary, an excellent sort of wine. The breed of cattle is good, and it has also a variety of game. At St. Annaberg, near the borders of Stiria, is a rich silver mine, which was first worked in the year 1754. It is remarkable that they have found in it a new species of silver ore, which is of an alkaline kind. Allum is also prepared here in plenty.

At Baden are some celebrated hot-baths. The Danube traverses Austria from east to west, and receives all the great and small rivers of this country. The former of these are the Morawa, or March, which receives the Teya, and divides a part of this country from Hungary; the Leitha, which also forms the limits of Hungary; with the rivers Trasen, Erlebach, Ips, Kamp, &c. which all rise in this country, and produce great variety of fish.

Upper Austria is mountainous, particularly towards Stiria and Bohemia, in which countries several tracts lie uncultivated; but the rest of the country is fruitful. Towards Stiria the mountains are high, but the other parts abound in low hills. The soil of Upper Austria, from its many springs, is wet, and the air all the year round moist and cool, which seems partly owing to the saline earth it contains, but chiefly to the situation of the country; for as it lies on the shady side of the mountains of Austria Proper, and of the still larger and higher ones of Upper Stiria and Saltzburg, the warm southerly and westerly winds are precluded.

Upper Austria is uncommonly fertile in mushrooms, and the inhabitants plant a vast number of fruit-trees. As there are here no vineyards, the inhabitants plentifully supply themselves with cyder and perry. This is also the first beer country on proceeding from Lower Austria towards the Danube; but as it has not a sufficiency of corn, that defect is supplied by Lower Austria. The breed of cattle here is pretty good; the woods and forests are numerous, and abound in all sorts of game.

Near Munden is a considerable mine of salt, out of which both the crystal and variegated sort is dug; but the latter is little esteemed. In these parts too fresh water is conveyed into the salt-works, or pits, which, after it has impregnated itself with alkaline particles, is extracted by machines, and conducted through canals for several miles in order for boiling. There are some other salt-works and some saline springs, and others that have a petrifying

ELECTORATE

BOHEMIA

MORAVIA

Upper Austria

Lower Austria

petrifying quality, and yet afford the best water for drinking of any in the country.

Here are several lakes and small rivers, which yield many sorts of fish; and also two medicinal baths.

There are fifteen royal towns in Lower Austria, with eighteen others belonging to particular lords; as also market-towns, and many common boroughs, religious foundations, and cloisters, which enjoy both a seat and voice with the country; and likewise other cloisters, citadels, and noblemen's seats.

In Upper Austria are seven royal towns, with five belonging to particular lords, eighty-one market-towns, many common boroughs, thirteen religious foundations, which enjoy both a seat and voice with the country, two knights commanderies, two colleges, one Jesuits college, seventy other cloisters, and two hundred and seventeen citadels and noblemen's seats.

The Austrian-German dialect, which is very different from the High Dutch, or proper German, is spoken from the Adriatic Sea to the north-north-west, and westerly as far as Silesia, Saxony, Franconia, Swabia, and Switzerland. It also extends to the east and south-east, through Hungary and the Sclavonian territories; yet there is an observable difference in the pronunciation, and in a few particular words used in certain parts of this large tract of country.

The states of Austria consist of the prelates, including bishops, abbots, and provosts; of the lords, under which class are reckoned princes, counts, and barons; of the knights; and lastly, of the towns and markets. The land-marshal is here always elected from among the lords; but the deputy land-marshal out of the order of knights.

The assemblies of the states are either general land-diets, or ban-diets; the latter of which are divided into the greater and lesser ban. These assemblies are appointed by the superior, and the business is laid before them either by the aulic counsellor, or by the archducal deputy; but the deliberations are carried on before the land-marshal. In these assemblies they treat of contributions, taxes, military affairs, &c. The land-diet of Lower Austria is held at Vienna, and that of the Upper at Lintz.

The bishopric of Vienna was immediately subject to the see of Rome, though the archduke has long had the right of nominating a bishop. In 1722, at the solicitation of the emperor Charles VI. it was raised by the pope to a metropolitan church and archbishopric. The archbishop is a prince of the holy Roman empire, and has the bishop of Newstadt, near Vienna, for his suffragan, but is subject to the supremacy of the archducal house of Austria.

The sciences in this country are in an improving condition, for there is an university at Vienna, and academies of painting, sculpture, and architecture. Manufactures are much improved; for in this country are those of silk, gold and silver lace, woollen and linen cloths, stuffs, stockings, porcelain, mirrors, plate, brass, and other articles. The importation of foreign manufactures is either prohibited, or under great restrictions. The trade of Austria gradually increases, and there are chiefly exported from thence saffron, wine, allum, and gunpowder.

S E C T. IX.

The Divisions of Lower Austria, and a particular Description of the City of Vienna, and the Manners of its Inhabitants.

LOWER Austria, which is also termed the Country below the Ens, is divided into four circles, over each of which is appointed a circle-captain. Of these circles, two lie on the south, and two on the north side of the Danube; the former from their situation, with respect to the forest of Vienna, are called the circles below and above the forest of Vienna; but the latter, from their situation with respect to Manhartsberg, the circles below and above the Manhartsberg.

We shall begin with giving a description of the principal places in what is called the circle below the forest

of Vienna, the seat of the emperor, and the capital of the German empire.

The celebrated city of Vienna, called by the Germans Wien, by the Turks Beez, and by the Poles Wieden, is situated in the forty-eighth degree twenty minutes north latitude, and in the sixteenth degree twenty minutes east longitude, on a branch of the Danube, which separates the suburbs of Leopoldstadt from the town, and receives the little river Wien, which passes through it between the city and suburbs. It stands in a pleasant situation; for to the north and east the country is entirely level, but to the south and west are seen a range of mountains thick planted with vines and trees; and the Danube, which is there very wide, divides itself into several arms that form so many islands stocked with wood. This city has always been the residence of the emperors of the house of Austria.

Vienna indeed is but of small extent, it being possible to walk round it on the glacis within the space of an hour. Its situation is capable of rendering it pretty strong, and it is actually well fortified; for it has a strong rampart defended by eleven stout bastions, and ten ravelins very broad and deep, with lined ditches, and the necessary out-works. The many churches and extensive cloisters the city contains, which have generally gardens and walks near them, take up almost one-sixth part of the whole city, whence the streets, which are narrow and crooked, are about eighty, and the houses are computed at no more than about twelve hundred and thirty; but these are from four to even seven stories high, and are in general well built of stone, and provided with large convenient cellars; and among them are many magnificent palaces, which have noble fronts, though the narrowness of the streets will not admit their being seen.

The lady Wortley Montague observes, with respect to the height of these buildings, that the town being too little for the number of people that desire to live in it, the builders seem to have contrived to repair that misfortune, by clapping one town on the top of another; and adds, You may easily imagine, that the streets being so narrow the rooms are extremely dark, and, what is still a more intolerable inconvenience, no house has so few as five or six families in it. The apartments of the greatest ladies, and even of the ministers of state, are divided but by a partition from that of a taylor or shoemaker. Those who have houses of their own let out the part they do not use to whoever will take them; and thus the great stairs, which are all of stone, are as common and as dirty as the street. It is true, when once you have travelled through them, nothing can be more surprisingly magnificent than the apartments. They are commonly a suite of eight or ten large rooms all inlaid, the doors and windows richly carved and gilt, and the furniture such as is seldom seen in the palaces of sovereign princes in other countries. The apartments are adorned with hangings of the finest Brussels tapestry, prodigious large looking-glasses in silver frames, fine Japan tables, beds, chairs, canopies, and window-curtains of the richest Genoa damask, or velvet almost covered with gold lace or embroidery. The rooms are also adorned with pictures, vast jars of Japan porcelain, and large lustres of rock-crystal.

The city is divided into four quarters, the Schotten, Wubmer, Stuben, and Carinthian. There are fifteen principal squares, the most remarkable of which are the six following: the Hof is the largest of them all, and, besides a stone fountain, has a magnificent monument of gilt metal, which the emperor Ferdinand III. caused to be erected in the year 1647, in memory of the immaculate conception of the Virgin Mary; but this pillar was removed in 1667, by the emperor Leopold, and another of brass erected in its place. The image of the Virgin Mary on this pillar is a master-piece, and is of brass gilt. This pillar has a pompous Latin inscription, composed by the emperor himself; the letters are of gold, and set in a brass plate. The New-market, in which is a fine fountain. The Graben, in which, besides two beautiful fountains, stands the marble Trinity pillar, which is sixty-six feet high; this is an admirable piece of architecture built with stone, on which is also a Latin inscription by the emperor Leopold its founder. Formerly it was

usual for people, by way of amusement, to sit round these pillars; which often produced many pleasant incidents. But a company, among which were several countesses, having given too much wine to a soldier on guard at the Virgin Mary's pillar, such a disturbance ensued as caused these assemblies to be forbidden; and at present people only kneel round the pillars. In the High-market stands Joseph's metal pillar, which was erected in the year 1732.

The principal church in this city is the metropolitan church of St. Stephen, a very dark Gothic structure of free-stone, adorned on the outside with sculpture representing saints, beasts, flowers, pyramids, &c. The roof is covered with glazed tiles of various colours. The highest tower is four hundred and sixty, or according to others, only four hundred and forty-seven Austrian feet and a half high. It is built of large blocks of free-stone, fastened together with iron braces, and is the strongest steeple in Europe. It has a great bell hanging in it, upwards of ten feet in height, and thirty-two feet two inches in circumference, weighing, exclusive of the clapper, seventeen tons and a half. The clapper, which is eleven feet and a half long, weighs thirteen hundred and twenty-eight pounds. It was cast by order of the emperor Joseph out of the Turkish field-pieces taken in several battles. In the inside of this church is a costly high altar, with many relics and curiosities, and a magnificent marble monument of the emperor Ferdinand III.

In Vienna are reckoned four parish churches, with ten other churches served by particular ecclesiastics, sixteen cloister churches, and eighteen cloisters; among these are three colleges of Jesuits, a college of regular canons, of Augustines, of St. Dorothea, a Capuchine convent, a Minorite convent, and the cloister of bare-footed Augustines, who have the imperial Aulic church, in which is kept, in silver repositories, the hearts of the high personages of the archducal house. This church belongs to the court, and you ascend to it up a pair of stairs out of the palace. Ferdinand III. had a chapel built here to St. Apollonia, the patroness of the teeth, in consequence of a vow he had made when his son prince Leopold cut his teeth. The tooth of St. Apollonia shewn here is likewise adored and kissed by the vulgar, who imagine the touch of it a cure for the tooth-ach.

Among the charitable foundations is the burghers hospital, in which three thousand persons are maintained.

The imperial museum is in the castle, and has an astonishing variety of curiosities in gold, silver, ivory, and mother of pearl, mathematical instruments of exquisite workmanship, excellent pictures, antique intaglios, vases of agate, jasper, crystal, garnet, emerald, and jewels of inestimable value. Among the curiosities is seriously shewn a dæmon, or familiar spirit, which being conjured out of a demoniac, was confined in a glass: but this is really nothing more than some dark-coloured moss, or something of that kind, which has some distant resemblance of a little man, and is naturally inclosed within a triangular piece of crystal.

The imperial library is a very handsome edifice, adorned with good paintings, sculpture, and a superb gallery: with respect to the number and importance of the manuscripts and printed books, it may vie with the Vatican and royal French libraries, and, with respect to printed books, exceeds them.

The land-house of the states of Lower Austria and the town-house are fine modern structures. The riding-house and the chancery of the empire are noble buildings in the modern taste. The other public buildings here are the imperial arsenal, the burghers arsenal, the imperial arsenal near the new gate, in which is every thing necessary for the equipment of the ships used on the Danube, and the opera-house, which is a magnificent structure.

The university is said to consist of four nations; these are the Austrian, Rhenish, Hungarian, and Saxon. An academy of painting, sculpture, and architecture, was founded here in 1705. The Theresian college, which was founded by the empress queen Maria Theresa, is a well instituted riding academy, the members of which are all uniformly dressed, and each of them pays for his board, lodging, washing, school-books, and other neces-

saries eight hundred florins yearly, and another hundred for riding. The Savoy Lichtenstein riding academy was founded by Maria Theresa, dutchess of Savoy, who was born princess of Lichtenstein.

Among the palaces of Vienna is that of prince Eugene, which consists of four stories, the third of which is the most magnificent; but the apartments and stair-case are somewhat darkened by the houses on the other side of the street. In the front are three doors opening into so many balconies, and in every story are seventeen windows. The roof is flat, in the Italian taste, and adorned with eighteen large statues. In one of the antichambers are fine paintings, representing the battles of Hochstet, Zenta, and four others; but the piece which first strikes the eye, is the relief of the city of Turin. Among the beautiful tapestry, that representing a shipwreck is particularly admired. Some of the apartments are hung with crimson velvet, especially that in which the late prince Eugene gave audience to the Turkish ambassador, under a canopy, and in a chair of state. The stove in this room is made of brass, and represents Hercules vanquishing the hydra. In another apartment is a book-case and a desk covered entirely with tortoiseshell. Nothing can be more beautiful than the looking-glass chamber; and indeed every part of this superb palace is embellished with exquisite pictures, glasses of all kinds, and fine chimney-pieces. The library contains fourteen thousand volumes, which are mostly folios, and being bound in red Turkey gilt, make a fine appearance. In this library is also a planetarium, in which Mr. Rowley, an Englishman, has accurately represented the revolutions of the heavenly bodies according to the Copernican system.

The prince of Lichtenstein has three palaces in Vienna; but that in the Herron street is the most magnificent. The front is adorned with columns and statues; and the palace is furnished in the Italian taste, with sculptures, paintings, and antiques. Among the paintings are several pieces by Rubens; particularly six capital pieces representing the history of Alexander the Great, valued at about twenty-four thousand dollars; Herodias with John the Baptist's head by Raphael: the building of the tower of Babel on vellum, and the overthrow of Pharaoh with his army in the Red Sea, painted on marble, are very curious. The saloon is elegant and lofty; the vaulted roof was painted by Belucci, who also painted the cieling of the first and second stories on canvas.

The suburbs are much larger than the city itself, which they encompass, but are removed to the distance of five or six hundred paces from the works of the fort. The line which encloses them, and extends on both sides to Leopoldstadt, was in the year 1704 thrown up against the Hungarian rebels, and afterwards lined with bricks; the gates and entries to it being always kept by regular guards; of these Leopoldstadt is the principal, and lies next the city on an island of the Danube; it was formerly called the Jews Town, but in the year 1670, the emperor Leopold driving that people from hence, it took its name from him. It contains one parish church, two monasteries, the old imperial Favourita, a citadel, which in the year 1683 was almost destroyed by the Turks, and only a small part of it is repaired. There are here also many fine houses and gardens.

Opposite to it on the other side of the Danube lie the large suburbs of Rossau, which contains some fine churches, palaces, houses, and gardens. The noblest of these palaces is that of prince Lichtenstein, which is extremely magnificent. The great stair-case consists of two flights, and every step cost sixty guilders, each being a single block of red marble, seven paces in length, and in the two flights are a hundred and eight of these steps. Though the Italian palaces greatly surpass all others in the beauty and magnificence of the stair-cases, yet Italy affords very few that equals this. The saloon, which is very superb, was painted by Pozzo, and is adorned with four beautiful stone statues, so finely encrusted with plaster, that they have the appearance of alabaster. Two of the apartments are entirely painted by Franceschini di Bologna; and in every part of this noble palace, the eye is entertained with pieces of painting by celebrated artists.

The

The walks, parterres, water-works, and statues, render the garden a most delightful place. It contains a great number of uncommon vegetables, and at the ends affords a very fine view of the country.

In the suburbs of Waringergessen is nothing worthy of notice.

In that called the Alstergasse is the hospital of invalids, with the pest-house, the great hospital, the Lower Austrian provincial academy, and count Paar's riding-school.

The populous suburbs of St. Ulrich is subject to the jurisdiction of the Benedictine Scots abbey in Vienna, and contains one parish church, a Capuchin monastery, and upwards of a hundred gardens.

In the suburbs called the Leimgrube is one church, one cloister containing a church, a military academy founded by Maria Theresa, the empress queen, and the imperial stables, which are equalled by few buildings of the kind, though the stalls in them are too narrow.

The suburbs called the Wien, from the little river of the same name which runs through it.

Gaudendorf, which belongs to the provost of St. Dorothea in Vienna, contains one convent of Dominicans, and a small church.

The Wieden is pretty extensive, and, besides a cloister and the church of St. Charles Boromæus, contains the new imperial favorita, a summer residence, though but meanly built.

The Rennweg is remarkable for its churches, convents, palaces, and noble houses. The cloister of the female Salerians, or English nuns, is pretty large, and has a small but costly church. These nuns are obliged to bring up and instruct young ladies. The palace of prince Schwarzenberg is extremely magnificent; the saloons, stair-cases, marble tables, looking-glasses, porcelain vases, paintings, beds, and other rich furniture, make this one of the finest palaces near Vienna. The trees in the large orangery in the garden, instead of being planted in pots or tubs, stand in the ground, and in winter are sheltered by little sheds, which on occasion may be warmed. The walks, groves, and water-works are extremely beautiful; and the last are supplied by means of an hydraulic engine worked by fire.

Adjoining to the above palace is that of prince Eugene, one of the finest buildings about Vienna. It has eleven rooms in a direct line in the front and the towers at the angles, and seven rooms in the wings. In the room adjoining to the prince's bed-chamber are several exquisite pieces of painting in miniature, and in the next apartment is a chandelier of rock-crystal valued at twenty thousand guildens, each gulden equal to two shillings and four-pence. Here is also a Dutch piece of painting of great value, representing an old woman on her death-bed, with her daughter on her knee taking her leave of her, while her maid is stirring a medicine, and the physician looking into an urinal. In the chapel is a fine picture of the resurrection of our Saviour. The large saloon is an oblong octagon, the ceiling of which is finely painted in fresco, and it yields a very fine prospect over the gardens towards the city. Among the excellent paintings in the other apartments are a beautiful piece representing Adam and Eve as big as the life, a woman embracing a youth in a bath, Endymion and Diana, and a copy of Ruben's three Graces, which is much esteemed. The gardens lie on a slope, and on that account make its elegant water-works appear to advantage. In that part of the garden on the left called Paradise, is a spacious aviary made of curious wire-work, and also beautiful walks and gilt summer-houses. On one side of this palace the prince has a view from his apartment of eight small courts, embellished with fountains and rows of chestnut trees, among which are to be seen a considerable number of exotic animals.

The suburb called the Landstrasse lies directly opposite on the other side of the Danube, and contains a fine cloister of hermits of the order of St. Augustin, who here wear white ermine; also a couple of chapels, a seminary of Jesuits, an hospital, and several fine houses.

The Prater, or imperial park, is a pretty large island planted with wood, and has some fine walks, to which the people in spring resort for taking the air.

The inhabitants of the city and suburbs amount to about a hundred and eighty or two hundred thousand. The country about Vienna is fertile, and produces good grafs.

The finest of all the imperial pleasure-houses is Schonbrun, which lies at the distance of a league from Vienna; it was begun by the emperor Joseph, who did not live to finish it. The pleasant situation of this place is, however, attended with one inconvenience, which is, that the little river Wien crosses the road several times between it and Vienna; and as it is subject to sudden floods, it frequently happens, that a person who goes to Schonbrun at noon without the least danger, in the evening finds his return rendered impracticable by the swelling of the river.

It will be proper before we take leave of Vienna, to give some account of the inhabitants of this celebrated city. The Protestants have the public exercise of their religion allowed them at the houses of the Swedish, Danish, and Dutch ambassadors; but in the streets they must take care not to come in the way of a procession of the Host, the ignorant multitude frequently handling very roughly those who make a conscience of kneeling as it passes by.

The pride of rank is an eternal subject of quarrels among the great, for none of them will, upon any condition, desist from their pretensions where they imagine their rank is concerned. The lady Wortley Montague observes, that they are never lively but upon points of ceremony, and mentions two coaches, which meeting in a narrow street at night, when the ladies in them not being able to adjust the ceremonial of who should go back, sat there with equal gallantry till two in the morning, when the emperor sending his guards they were both taken out exactly at the same moment, and carried away in chairs. The men are not less touched with this point of honour, and not only scorn to marry, but to make love to any woman of a family less illustrious than their own.

As the houses of the great are richly furnished, the good taste and magnificence of their tables are answerable to that of their furniture. They have frequently fifty dishes of meat, all served in silver, and well dressed, with a dessert proportionable served in the finest china. But what appears most surprising is the variety and richness of their wines. It is usual to lay a list of their names upon the plates of the guests along with their napkins, and there are sometimes eighteen different sorts, all exquisite in their kind.

Mr. Keyser says, that when the empress amuses herself in the evening with playing at cards, her company are the ladies of the privy-counsellors or lords of the bed-chamber, according to their seniority. She usually plays at a gulden, or two shillings and four-pence a fish.

Among the diversions of the imperial court, those of the carnival must not be omitted; though the strictness of the ceremonial checks the liberty allowed at other courts in the carnival masquerades, no ladies but those who have access to the empress's chamber are admitted at court on those occasions. The emperor generally dances several times with the empress and archduchesses, but the empress dances with the emperor only. In the country-dances their imperial majesties are spectators, but the archduchesses mingle with the company.

On the saint's day of the name of any of the royal family operas are exhibited, each of which is said to cost about sixty thousand guildens; for the magnificence of the theatre, the splendor of the decorations, the richness of the habits, and the performance in the orchestra, surpass any thing of the kind in Europe. These days are called days of gala; and the ladies of quality, whenever they have a mind to display the magnificence of their apartments, or oblige a friend by complimenting them on the day of their saint, declare, that on such a day will be their gala. All the friends or relations of the lady whose saint it is, are obliged to appear in their best cloaths and all their jewels. The mistress of the house takes no particular notice of any body, nor returns any body's visit. The company are splendidly entertained, and afterwards divided into several parties at cards, or conversation, all games of hazard being forbidden.

The opera is here performed at court; and as the noble lady with whose observations we have in several parts embellished this work has fully described them, we shall give a particular account of this and other diversions from her letters. This lady, on visiting one of these operas, says, "The stage was built over a very large canal, and at the beginning of the second act divided into two parts, discovering the water; on which there immediately came, from different parts, two fleets of little gilded vessels, that gave the representation of a naval fight. It is not easy to imagine the beauty of this scene, and all the rest were perfectly fine in their kind. The story of the opera was the enchantment of Alcina, which gives opportunities for a great variety of machines and changes of the scenes, which are performed with surprising swiftness. The theatre is so large that it is hard to carry the eye to the end of it, and the habits in the utmost magnificence, to the number of a hundred and eight. No house could hold such large decorations; but the ladies all sitting in the open air, exposes them to great inconveniences; for there is but one canopy for the imperial family, and the first night it was represented, a shower of rain happening, the opera was broke off, and the company crowded away in such confusion, that I was almost squeezed to death.

"But if their operas are thus delightful, their comedies are, in as high a degree, ridiculous. They have but one play-house, where I had the curiosity to go to a German comedy, and was very glad it happened to be the story of Amphitruon. As that subject has been already handled by a Latin, French, and English poet, I was curious to see what an Austrian author would make of it. I understand enough of that language to comprehend the greatest part of it; and, besides, I took with me a lady that had the goodness to explain to me every word. The way is to take a box, which holds four, for yourself and company. The fixed price is a gold ducat. I thought the house very low and dark; but I confess the comedy admirably recompensed that defect. I never laughed so much in my life. It begun with Jupiter's falling in love out of a peep-hole in the clouds, and ended with the birth of Hercules. But what was most pleasant was, the use Jupiter made of his metamorphosis; for you no sooner saw him under the figure of Amphitruon, but instead of flying to Alcmena with the raptures Mr. Dryden puts into his mouth, he sends for Amphitruon's taylor, and cheats him of a laced coat, and his banker of a bag of money, a Jew of a diamond ring, and bespeaks a great supper in his name; and the greatest part of the comedy turns upon poor Amphitruon's being tormented by these people for their debts. Mercury uses Sofia in the same manner. But I could not easily pardon the liberty the poet has taken of larding his play, not only with indecent expressions, but such gross words as I do not think our mob would suffer from a mountebank. Besides, the two Sofias very fairly let down their breeches in the direct view of the boxes, which were full of people of the first rank, that seemed very well pleased with their entertainment, and assured me this was a celebrated piece."

It ought, however, to be added, in justice to the Germans, that since the time this lady wrote, they have greatly improved in the arts, and that their poetry, which even at the beginning of the present century was very rude, and in its infancy, is now much improved, and they have dramatic pieces that would do honour to any nation.

The above ingenious lady describes another common amusement of the court, which will farther serve to characterize the taste of the great in this metropolis. The empress was seated on a little throne at the end of a fine alley in her garden, and on each side of her were ranged two parties of her ladies of quality, headed by two young archduchesses, all dressed in their hair full of jewels, with fine light guns in their hands; and at proper distances were placed three oval pictures, which were the marks to be shot at. The first was that of a Cupid filling a bumper of Burgundy, and the motto, "It is easy to be va-

liant here." The second, Fortune holding a garland in her hand, with the motto, "For her whom Fortune favours." The third was a sword with a laurel wreath on the point, the motto, "Here is no shame to the vanquished." Near the empress was a gilded trophy wreathed with flowers, formed of little crooks, on which hung rich Turkish handkerchiefs, tippets, ribbons, laces, &c. for the small prizes. The empress gave the first with her own hand, which was a fine ruby ring set round with diamonds in a gold snuff-box. There was for the second a little Cupid set with brilliants; and besides these a set of fine china for the tea-table, japanned trunks, fans, and many other things of the like nature. All the men of quality at Vienna were spectators, but the ladies alone had permission to shoot, and the archduchess Amelia carried off the first prize.

S E C T. X.

A concise Description of the other principal Places in the Dutchy of Austria.

ANOTHER of the emperor's pleasure-houses is Laxenburg, which is situated about two German miles from Vienna, in a pleasant little wood, and near it is a pretty well inhabited village and park. The extensive circumjacent plain affords very great conveniences for the baiting of herons, which is said to be performed here in spring-time by the imperial family.

In the neighbourhood of Vienna is Baden, which is much frequented for its warm baths, assemblies, and other diversions. Both sexes bathe here without distinction in the same bath, and at the same time. The bathing cloaths are made to cover the whole body, and those of the women have lead at the bottom of them to keep them down. There are seats within the baths for the convenience of sitting in the water, which can be raised or lowered at pleasure. The company walk up and down in the bath conversing together, and the ladies are sometimes treated with sweetmeats. There are particular doors and stairs leading into the separate stove-rooms out of the bath, where the different sexes dress and undress apart. Some of these baths are within and others without it, and in most of them the water is extremely clear. The principal is called the Women's bath, and next to that the Duke's and Anthony's baths. There is also one appropriated to the use of the poor. The sulphureous effluvia arising from the baths tinge most kind of metals with yellow; and a silver cup, after being some time used for drinking the water, contracts a sort of gilding. These baths are chiefly recommended to patients afflicted with the gout, lameness, pains in the joints, and any arthritic disorders. Barren women often resort thither and find relief; but whether this proceeds from the virtue of the water, or that of the company, we shall not determine. Before the principal church in this town is a fine pillar dedicated to the Holy Trinity.

Neustadt is a pleasant and well built town on the Leitha: it is well fortified, and contains some broad even streets, with some fine squares ornamented with pillars in honour of the Virgin Mary. These kind of pillars have a fine effect in a city; and, though seldom seen in other popish countries, are very frequent in the Austrian territories. The palace here has been allotted for the new erected military academy, and is now inhabited by the young gentlemen, who are here instructed by officers appointed for that purpose in all parts of the art of war, and by others in the mathematics and polite literature. There is also here a college of Jesuits. Out of the fine earth near this place is made a very beautiful sort of porcelain.

The most considerable places in Upper Austria, which is divided into four quarters, are the following:

Lintz, the capital of Upper Austria, stands in an agreeable situation on the river Danube, in the forty-eighth degree twenty-one minutes north latitude, and the fourteenth degree twelve minutes east longitude. It is well built and populous, and has some fine suburbs. The old town consists almost entirely of one single street, and includes in it the citadel, which is seated on an eminence that affords a fine open prospect. In this citadel are the courts of justice for Upper Austria; and in the town

town are a house belonging to the states, a parish church, a considerable college of Jesuits, the academy, and a fine church endowed by the emperor Ferdinand II. with four cloisters of monks, and two of nuns, a commandery belonging to the Teutonic order, and some manufactures. This town carries on a considerable trade.

Steyr is a town situated on a river of the same name, near the place where it falls into the Ens. It consists of three parts; the town with its suburbs, and the villages of Ens and Steyr, both which have a communication with the former by means of bridges. It has a citadel, which stands on a point of a steep rock within the walls, and within the town are also one parish church, one college of Jesuits, together with a cloister of Dominicans and another of nuns, as also an hospital. Without the town is a convent of capuchins, and all these religious houses have churches. Most of the inhabitants work in steel and iron. This place was formerly the capital of a county, and belonged to Stiria; but it has been separated from thence, and added to the country above the Ens.

SECT. XI.

Of the Dutchy of STIRIA.

Its Situation, Mountains, and Face of the Country; its Produce, Rivers, &c.

STIRIA, or Steyermark, in the circle of Austria, is bounded by the dutchy of Austria on the north; by Hungary on the east; by Carniola on the south; and by Carinthia and Saltzburg on the west. The northerly part is called the Upper Steyermark, and the southerly the Under.

Upper Steyermark contains many high and steep mountains, among which the Grimming is the highest in the country; but by the diligence of the inhabitants this dutchy is pretty well cultivated, so that in many places the highest tops of the mountains are inhabited.

The people who dwell in these parts in winter, when great quantities of snow fall, are blocked up for several months, and as it were rendered captives. Indeed they are so habituated to the cold, that they seldom come down from these eminences. It is astonishing that they are able to succeed so well with the plough on these mountains, and that the eminences themselves are so fertile.

The inhabitants cultivate a fine sort of wheat, which is sufficient not only to supply their necessities, but in some measure also for sale. They have fruit, large herds of cattle, chamois goats, and wild fowl. The brooks and lakes, many of which lie between the high rocks, are rich in fish. In some places are small vales, and the inhabitants take advantage of every spot of earth.

The mountains contain silver, lead, copper, and particularly iron. The Stirian steel is reckoned the best in Europe. The forests, with which the ridges of the mountains are covered, yield a sufficient quantity of wood for the use of the smelting huts. In these mountains are likewise hot baths and medicinal springs.

The principal rivers which run through this country are the Muehr and Ens, both of which arise in the bishopric of Saltzburg.

Lower Steyermark has fewer mountains and more plains. The hills produce a fine wine, and the plains which are also fruitful, have hot baths and medicinal springs. In the quarter of Cilli, as in Carniola and Italy, dormice are caught in plenty, and eaten.

The language of the Stirians is very rough. They speak the Wendish tongue, which is in use among the common people for several miles round Gratz; but those who are raised only a small degree above the vulgar speak not only Wendish, but German and Italian, and the principal inhabitants speak also French.

In the whole dutchy are twenty boroughs, near one hundred market towns, and about five hundred citadels, many of which stand on the highest summits of the rocks. The highways, notwithstanding the country is mountainous, have been put into excellent condition.

The principal place in Lower Stiria is the city of Gratz, the capital of the whole dutchy, which is seated on the river Muehr, in the forty-seventh degree twenty-

two minutes north latitude, and the sixteenth degree ten minutes east longitude. It has suburbs on each side the river, which exceed the town in bigness, to which they are joined by a bridge. The city is well fortified, and contains some fine streets and houses. The castle stands on a high hill, and here is a good armoury and magazine, constantly well furnished. The Jesuits have a fine church, and a chapel detached from it, where the architecture and sculpture are well worth seeing. Over the entrance of this chapel is a Latin inscription to this purpose, "The imperial mausoleum of Ferdinand II. emperor of Rome, sacred to St. Catharine virgin and martyr." On the roof is represented the life of the emperor Leopold in several emblematical paintings, and on the tower is an observatory well furnished with mathematical instruments. The other public buildings are the Jesuits college, the university, the parish church, the sovereign's hospital, the fine Trinity pillar of gilt brass in the market-place, the sovereign's fort, in which the privy council, the government, the chamber for the Inner Austrian countries, and the military council, are kept; and in this fort is also the arsenal; the land-house, in which the land-diets are held; the arsenal of the land states, and the council house. There are also in the city eight cloisters, with their churches. In the Dominican convent is a piece of painting representing Catharine of Sienna exchanging her heart for that of Christ, and at some distance on the right hand, is the portrait of St. Alan, a Dominican monk, who was a native of England. An inscription underneath says, that the blessed Virgin was so pleased with his love to her, that in the presence of the Son of God, an infinite number of angels, and blessed spirits, she was espoused to St. Alan; gave him with her virgin mouth a kiss of everlasting peace, refreshed him with the milk of her most chaste breast, and presented him with a ring in token of the marriage. However, some of the more sensible Romanists have openly expressed their abhorrence of such impious fictions.

In each of the suburbs that lie on the west side of the Muehr, is a church with a cloister; but in the large suburbs on the other side of the river, are several churches and convents. In the midst of a plain about a mile from the city, is a round hill, on which are erected nine chapels in commemoration of Christ's passion. In one of these chapels the whole crucifix is covered with pearls; but the sculpture of all of them is very coarse, and sometimes ridiculous. Besides, the holy sepulchre, which is said to be constructed after the manner of that of Jerusalem, here is also a scala santa, or holy stairs, by ascending which every Friday, and on the days of the invention and elevation of the cross, people may gain forty days indulgence.

About the distance of four miles from the above mount, to which is given the name of Calvary, is the seat of count Adam. The gardens, paintings, and water-works, are greatly admired by the country people, though they contain nothing very extraordinary.

The principal places in Upper Stiria are, Judenburg, its capital, which is seated on the high bank of the Muehr, and commands a prospect into a plain surrounded with high mountains that are continually covered with snow. This place contains a royal fort, a parish church, a cloister of Minorites, in which is a church, and a college of Jesuits, and without the town is a convent of nuns.

Leuben was formerly the capital of the county, and contains a college of Jesuits, and a Dominican convent, both of which have churches, and without the walls are two parish churches, one of which is in the suburbs, on the other side of the Muehr, in which is also a convent of Dominicans. A great trade in iron is carried on here.

SECT. XII.

Of the Dutchy of CARINTHIA.

Its Situation, Rivers, Mountains, and principal Places.

THE dutchy of Carinthia, in the circle of Austria, is bounded on the east by Stiria; on the north by Stiria and the archbishopric of Saltzburg; on the south by

by Carniola, and the Republic of Venice; and on the west by Tyrol.

This country is woody and mountainous; the highest of the mountains are called St. Ulrich, St. Helena, St. Veit, and St. Laurence. Several of the mountains of this country yield good iron, and some of them lead. There are many fertile dales, which produce wheat and other grain, yet the country cannot produce corn sufficient for the inhabitants.

This country has also a great number of lakes, brooks, and rivers. The largest river is the Dran, which issues out of Tyrol, and traversing Carinthia from east to west, receives all the other rivers and brooks of the country.

The only religion professed here is that of the Romish church, though there were formerly many professors of the Lutheran religion, and the youth are instructed in the Jesuits college at Clagenfurt. In this dutchy are eleven boroughs, and twenty-one market towns. The principal manufactures are those of iron and steel, which are worked in various ways, and afterwards exported. The dutchy is governed by a land captain, and annually contributes six millions thirty-seven thousand six hundred ninety-five florins to the support of the military state of the house of Austria.

The principal towns in this dutchy are,

Clagenfurt, the capital of the dutchy, which is situated near the river Glan, in the forty-seventh degree ten minutes north latitude, and the fourteenth degree twenty minutes east longitude, and is also joined by means of a canal with the Wordsee. It is well built, and surrounded with a wall said to be broad enough for five coaches to drive a-breast. It contains six churches, a college of Jesuits, an academy, two convents of monks and one of nuns, and a provincial-house. It is adorned with two marble pillars, one consecrated to the Holy Trinity, the other to the Virgin, and an equestrian statue of the emperor Leopold. In the year 1600 Martin, bishop of Seckau, came to this town, accompanied by four hundred soldiers, in order to burn the Lutheran books and abolish that religion. In 1636, and 1723, the town was almost entirely consumed by fire.

Freisach, the oldest town in Carinthia, is situated on the rivulet of Metnitz, and belongs to the archbishop of Salzburg.

It contains a citadel and two cloisters, and without the town stands the citadel of Geyersberg, where the archiepiscopal vicar resides.

S E C T. XIII.

Of the Dutchy of CARNIOLA.

Its Situation, Extent, Mountains, Roads, and Produce; the Hardiness of the People, their Languages, Religion, Arms, and Exports; with the principal Places in this Country: among which is a particular Account of the Lake of Cirknitz, some remarkable Caverns, and Mines of Quicksilver.

CARNIOLA, which is also included in the circle of Austria, is bounded on the north by Carinthia and Stiria; on the east by Liburnia, Dalmatia, and Croatia; on the south by that part of Istria possessed by the republic of Venice, and by a part of the Adriatic Sea; and on the west by Friuli, the country of Gortz, and a part of the Adriatic; extending in its greatest length a hundred and forty-two miles from east to west, and a hundred and eighteen from north to south.

This dutchy is for the most part mountainous, and some of the mountains are quite naked, while others are covered with wood; some of them are uninhabited, and many of their summits are continually covered with snow.

In winter, when the snow lies deep on the ground, some of the peasants make use of small baskets, which they bind to their feet; and others have a kind of snow-skates made of thin narrow boards, like those used by the Laplanders, by the help of which, and a stout staff or pole, they descend from the mountains with great speed. One of the most remarkable of these mountains is the Lobel, called by the Carinthians Lybel: it is high, rocky, and steep; and therefore the road winds round it,

in a serpentine form, for near five miles. This road is pretty well paved, and near the top a passage has been hewn through the rock about a hundred and fifty geometrical paces in length, twelve feet high, and nine broad; and this separates Carniola from Carinthia. The prospect from this mountain is uncommonly fine.

It is remarkable that the roads through Carniola and Stiria, though the country be so very mountainous, are extremely good. The making of these roads at first was very burthensome to the subjects; but as they are now completed, the expence of keeping them in order is not very great. First all the stones were made use of to raise it to a proper height. On each side is a ditch secured with large stones well compacted, and the road between these ditches consists of a stratum of flint-stones beaten small. This is covered with sand mixed with a kind of clay, which makes the road very smooth and hard, like a threshing-floor. The greatest care is taken to repair these roads; and the labourers who have good wages for that purpose, have their dwellings along the side of the roads, that they may be at hand to keep them in good order.

In Carniola are medicinal springs and hot baths: it also contains several lakes, and some rivers, the principal of which is the Sau, into which the other rivers discharge themselves; it is navigable, and its stream uncommonly rapid; it flows into Hungary, and discharges itself into the Danube.

Though this country is mostly mountainous, yet it contains many fruitful valleys and fields, which not only yield good pasturage, but every year produce a double crop; for when wheat, rye, barley, peas, beans, and lentils are cut down, they sow buck-wheat. This dutchy also produces excellent fruit, which becomes early ripe, and of which the inhabitants make cyder and perry: large chesnuts and walnuts are here very plentiful, and in some parts are olives, citrons, oranges, lemons, pomegranates, figs, and grapes, of which an exquisite white and red wine are made.

The bowels of the earth yield all sorts of minerals and metals, as copper, iron, and lead; and the marble of this country is very beautiful: but salt is wanting, and the people are obliged to purchase it at the magazines provided by the sovereign.

There are here horses and horned cattle in great plenty, and the people furnish themselves with all sorts of venison and fowl, and with many kinds of fish.

This country is more populous than one would imagine; for it contains twenty-one boroughs, thirty-five markets, and, according to Valvasor, upwards of four thousand villages. The common people are extremely hardy, for they go bare-foot in winter through the snow, and the men always with open breasts. At night they sleep without bed or bolster on a hard bench, and their food is always mean. The common people are of Slavonian extraction; but the principal nobility are for the most part descended from the Germans.

The two principal languages in Carniola are the Slavonic and the German; in the latter of which all letters are written, judicial matters carried on, and all writings made.

The Christian religion was gradually received here about the latter end of the eighth century. The Lutheran doctrine also gained a considerable footing in the sixteenth century; but was afterwards abolished, and all the inhabitants at present profess the popish religion, except the Walachians and Uscocs, who adhere to the Greek religion, and stile themselves Old Believers. In Carniola are three bishoprics, that of Laubach, to which belong a number of parishes in Carniola, twenty-one parishes in Stiria, and sixteen in Carinthia; the other bishoprics are those of Biben and Trieste. In this dutchy there are computed to be a hundred and thirty-four parishes, and twenty-four religious houses.

The arms of this dutchy are an eagle crowned, on whose breast and expanded wings is a dived crescent.

From Carniola are exported into other countries horned cattle, sheep, cheese, white and red wine, quicksilver, iron, steel, oil of olives, linen, a kind of woollen stuff, Spanish leather, which is prepared in plenty in Upper Carniola,

Carniola, honey, timber for ship-building, and many sorts of wooden-ware, as boxes, dishes, trenchers, spoons, sieves, &c.

Carniola annually contributes to the house of Austria three hundred and sixty-three thousand one hundred and seventy one florins fifty-six kruiters. This dutchy is divided into Upper, Lower, Middle, and Inner Carniola.

Upper Carniola, commonly called Gorenška Stran, enjoys a wholesome air and fresh springs. The vineyards here are but few. Iron is found in the greatest plenty, and there are profitable iron-works in many parts of the country. The lake of Feldes is near five miles long, and above two broad; it is uncommonly deep, but in its middle rises a round mountain, on which stands a small church, and at its foot is a fine spring. The lake of Wocheiner arises out of a copious spring that rolls from a very high rock into the dale of Wocheiner, which is about three miles long and a mile broad, and out of it runs a river called the Wocheiner Sau, which, after a course of nineteen miles, discharges itself into the Sau. Both in the lake and river are excellent trout.

In this dutchy are the following remarkable places:

Laubacht, or Laybach, the principal town in Carniola, is situated on a navigable river of the same name, by which it is so divided, that it lies partly in Upper and partly in Lower Carniola. That part which forms the latter, and is situated on the other side of the river, is the largest and finest. The royal citadel here stands on an eminence covered with trees and beautifully cultivated, and at its foot is that part of the city in which are the market, the town-house, the cathedral, and episcopal palace. The cathedral is finely painted, and under the cupola are four statues of its antient bishops. In the Augustins church, behind the high altar, is a *Casa Santa*, in imitation of that at Loretto. The Ursuline nuns have a very beautiful light church, and that of St. Peter is one of the finest in the city.

At the Jesuits church is a superb altar of marble, adorned with four statues that are worth seeing: their library is well contrived, and those fathers have spacious wine-vaults capable of containing three thousand pipes, which is the less surprising, as most of the rents of their estates are paid in wine. The whole town contains three suburbs, in one of which live the butchers, in the second are chiefly fishermen, and the third is principally inhabited by mariners. These suburbs contain five churches, four cloisters, and a commandery of the knights of Malta. The streets are narrow; and, besides the above buildings, the council-house, and the royal provincial and city arsenal, are worthy of notice. The bishop is immediately under the pope, and bears the title of a prince of the holy Roman empire. This place carries on a considerable trade.

Lower Carniola, more usually called Dalenska Stran, contains many fruitful valleys, and produces red and white wine. In many places there are here no springs, and particularly the fertile bottom of Temnitz labours under a total want of springs and running water; whence the inhabitants, when they have been long without rain, are obliged to fetch water at five or six miles distance. Among the caverns or grottos in this part of Carniola, that near Lueg is worthy of notice. The entrance of this cavern extends a considerable length under the rocks, and within it are seen many icicles equal in whiteness to snow itself.

One of the principal towns in this district is Rudolphswerth, or Neustadtlein, a royal town seated on an eminence on the river Gurk, and founded by the archduke Rodolph IV. in 1365, whence it received its name. It has a collegiate church, to which belong four others in the town, fourteen in the country, and five parishes in Stiria. It has a monastery of Franciscan friars, and another of Capuchins. The many incursions of the Turks into the territory belonging to this town, together with fires and pestilence, have reduced it from its former flourishing state.

The next division is Middle Carniola, to which belongs a tract called Dry Carniola, which is between four and five German miles in extent; and if we include in it the bottom of Temnitz, which belongs to Lower Car-

niola, and is also destitute of water, it is between six and seven in compass: yet this tract of land, though almost every where mountainous and stony, is covered with great and small villages, and in some parts of it the inhabitants produce good wine. The celebrated lake of Cirknitz in this part is very remarkable; it takes its name from the neighbouring market-town, and is encompassed with wild, rough, and stony mountains; but round it also lie two inhabited citadels, nine villages, and twenty churches.

This lake is one German mile in length from north to south, half a German mile in breadth, and from one, to two, three, and four fathoms in depth, the pits excepted, some of which are many fathoms deep. In it lie three beautiful islands covered with trees: these islands are called Vornec, Velha Goriza, and Mala Goriza. A peninsula also runs into this lake, and is separated from the island of Vornec by a canal. In the lake are many holes or pits with long ditches like canals, and eight brooks discharge themselves into it.

It is a common saying, that in this lake a person may sow and reap, hunt and fish, within the space of a year; but this is the least remarkable circumstance in it, and no more than what may be said of almost any other spot that is overflowed in winter or spring. The most wonderful circumstance is its ebbing and flowing. The former always happens in a long drought, when it runs off through eighteen holes at the bottom, which form so many eddies or whirlpools. Valvasor mentions a singular method of fishing in one of these holes called Ribescajama, and says, that when the water is entirely run off into its subterraneous reservoirs, the peasants venture with lights into that cavity, which is in a hard rock, three or four fathoms under ground, to a solid bottom; whence the water running through small holes, as through a sieve, the fishes are left behind, caught, as it were, in a net provided by nature.

At the first appearance of its ebbing a bell is rung at Cirknitz, upon which all the peasants in the neighbouring villages, with the utmost diligence, prepare for fishing; for the greatest part of the fish generally go off at the beginning of the ebb, and seldom stay till the water is considerably decreased. Above a hundred peasants never fail to exert themselves on this occasion, and both the men and women promiscuously run into the lake stripped quite naked, though both the magistrates and clergy have used their utmost endeavours to suppress this indecent custom, particularly on account of the young lay-brothers of a neighbouring convent, who have the privilege of fishing there; and, notwithstanding the prohibitions of the fathers, leave the convent in order to see this uncommon spectacle. The peasants, however, are not observed to be guilty of more lewdness at these times than at others, when they are clothed. At these ebbings an incredible number of pike, trout, tench, eels, carp, perch, &c. are caught in the lake; and what are not consumed, or disposed of while fresh, are dried by the fire.

Though every part of the lake is left dry, except two or three pools, yet Mr. Keysser says, immediately upon the return of the water, it abounds in fish as much as it did before; and the fishes that return with the water are of a very large size, particularly pikes weighing fifty or sixty pounds. It is also remarkable, that when it begins to rain hard, three of the cavities spout up water to the height of two or three fathoms, and if the rain continues, and is accompanied with violent thunder, the water bubbles out of all the holes through which it had been absorbed, two of them excepted, and the whole lake is again filled with water in twenty-four, and often in eighteen hours. Sometimes not only fish, but live ducks, with grass and fish in their stomachs, have emerged out of these cavities.

In a rock on one side of the lake, but considerably higher than its surface, are two caverns, at some distance from each other; and when it thunders the water gushes out of both, with great noise and impetuosity: if this happens in autumn, they also eject a great many ducks, which are blind, but very fat, and of a black colour; and though they are at first almost bare of feathers, in a fortnight's time, or at farthest before the end of October,

they are entirely fledged, recover their sight, and fly away. Each of these caverns is six feet high, and as many broad; and when the water gushes out of them, it is in a large column of the same dimensions, and in a continual stream. There is a large passage in each of these caves, where a man may walk upright for a considerable way; but it is said that no person has ever yet ventured into them, to search into the nature of the inner caves and reservoir to which these apertures lead; for there is no certainty but that in an instant he may be surprized by the water rushing upon him, with the force and rapidity of a fire-engine.

When the lake ebbs early in the year, within twenty days time grass grows upon it, which is mowed down, and the bottom afterwards sown with millet: but if the water does not run off early nothing can be sown, and if it soon returns, as it sometimes does, the seed is lost: otherwise after the millet harvest all manner of game is hunted and shot in it.

In Middle Carniola are several little royal towns, and some market towns; but none that deserve a particular description.

We now come to Inner Carniola, a division which is for the most part mountainous and full of small eminences. Little corn is cultivated here; but it produces a great deal of very good wine, which is commonly called Italian, and is exported to very distant countries; but in many places the inhabitants labour under great want of fresh water.

The most remarkable places in this division are the following:

Adlsberg, or Adlersberg, in the Slavonian language called Postoina, a well-built market-town, situated at the foot of a high rocky mountain, on which stands a citadel.

About half way up the acclivity of this mountain is the entrance into a large cavern that is divided into a great number of subterraneous passages. The eye is here delighted with viewing a vast number of sparry icicles, formed on the arched roof of this vast cavern, by the exsudations of a lapideous or petrifying fluid, which form the most beautiful decorations. The sides are covered with all kinds of figures formed by the same exsudations, to which the imagination of the spectator gives various forms never intended by nature; so that it is not at all strange that some people should make out dragons, heads of horses, tygers, and other animals. Several pillars, which are to be seen on each side, proceed from the droppings of the petrifying fluid from the top, which form a kind of sparry pillar on the bottom of the cave: this gradually increases, till it at last joins the icicle at the top, by meeting it about half way, and thus a complete pillar is formed. If a person's curiosity will carry him so far, he may rove about two German miles in the subterraneous passages of this cavern.

It is remarkable that the river Poig, which rises in the above mountain, about four English miles from Adlersberg, runs again to it with an inverted course, loses itself near the entrance of the cavern, and falls a great depth into the rock, as is evident from its roaring noise, and the sound caused by flinging a stone into the hole. The same river appears again near Planina; but soon after a second time loses itself in a rock, and at length emerges a third time, when it assumes the name of the Laubach.

Tybein or Duin, which stands on an eminence on the Adriatic, has a small harbour, a cloister, and a citadel. At a small distance is dug a very beautiful black marble, and in the rocks on the sea is found on breaking off a piece of them, a living snail about the thickness of a man's fist, and eatable. The stone in which these snails are inclosed, contains many small apertures.

Lucg, a citadel seated on the center of a high rocky mountain that rises perpendicularly. This large building stands in a hole in the rock in such a manner that no rain falls on it; but it has a roof to defend it against the water which trickles down from the rocks. From this citadel there is no other prospect than that of the heavens. One half of the fore tower alone projects: it is extremely damp, and in summer cool.

About two German miles from Adlersberg is a remarkable cavern, named St. Magdalen's cave. The way to it being covered with stones and bushes, is extremely troublesome; but the great fatigue in going is overpaid by the satisfaction of seeing such an extraordinary cavern. You first descend into a kind of hole, where the earth seems to be fallen in for ten paces before you reach the entrance, which resembles a fissure in a huge rock caused by an earthquake. Here the torches are always lighted to conduct travellers; for the cave is extremely dark. This wonderful cavern seems as if divided into several large halls, and other apartments. The vast number of pillars by which it is ornamented by nature, give it a superb appearance, and are extremely beautiful; for they are as white as snow, and have a kind of transparent lustre, not unlike that of white sugar candy. The bottom is of the same materials, so that a person may imagine he is walking among the ruins of some stately palace, amidst noble pillars and columns, partly mutilated and partly entire. From the top, sparry icicles are seen every where suspended, in some places resembling wax tapers, which from their radiant whiteness appear extremely beautiful. All the inconvenience here arises from the inequality of the bottom, which may make the spectator stumble, while he is viewing the beauties above and around him.

Idra, or Ydra, is a small town, seated in a deep valley, amidst high mountains on the river of the same name, and at the bottom of a descent so steep, that it is very difficult and sometimes dangerous, to ride to it. The town consists of about two hundred and seventy scattered houses, and a citadel; but the number of the inhabitants is said to amount to about two thousand.

This town is famous for its quicksilver mines, which were first discovered in the year 1497. Before that time, says Mr. Keyser, this part of the country was only inhabited by a few coopers, and other artificers in wood, with which this country abounds. But one evening a cooper having placed a new tub under a dropping spring, in order to try if it would hold water, when he came in the morning to take the tub away, found it so heavy, that he could hardly move it. At first the superstitious notions that are apt to possess the minds of the ignorant, made him begin to suspect that his tub was bewitched; but at last perceiving a shining fluid at the bottom, and not knowing what to make of it, he went to Laubach, where he shewed it to an apothecary, who being an artful man, dismissed him with a small gratuity, and bid him bring him some more of the same stuff whenever he could meet with it. This the poor cooper frequently did, being highly pleased with his good luck; till the affair being at last made public, several persons formed themselves into a society, in order to search farther into the quicksilver mine. In their possession it continued till Charles duke of Austria, perceiving the great importance of such a work, gave them a sum of money, as a compensation for the expences they had been at, and took it into his own hands.

The subterraneous passages of the mine are so extensive, that it would take up several hours to go through them. The greatest perpendicular height, computing from the entrance of the shaft, is eight hundred and forty feet; but as they advance horizontally under a high mountain, the depth would be much greater, if it was measured from the surface of the hill. One way of descending down the shafts is by a bucket; but as the entrance is narrow, the bucket is liable to strike against the sides, or to be stopped by something in the way, so that it may be easily overset. The other way of going down is safer; this is descending by a great number of ladders, placed obliquely in a kind of zig-zag; but as the ladders are wet and narrow, a person must be very cautious how he steps, to prevent his falling. As you descend there are resting places in some parts, that are very welcome to the weary traveller. In some of the subterranean passages the heat is so intense, as to throw a man into a perfect sweat; and formerly in some of these shafts the air was extremely confined, so that several miners have been suffocated by a kind of igneous vapour called the damp; but by sinking the main shaft deeper,

deeper, this has been prevented. Near the main shaft is a large wheel, and an hydraulic machine, by which all the water is raised out of the bottom of the mine.

Virgin mercury is that which is prepared by nature, and is found in some of the ores of this mine, in a multitude of little drops of pure quicksilver. This is also to be met with in a kind of clay, and sometimes flows down the passages or fissures of the mine in a small continued stream, so that a man has frequently gathered in six hours above thirty-six pounds of virgin mercury, which bears a higher price than common quicksilver. The rest is extracted from cinnabar, (which is the ore of quicksilver) by the force of fire.

Every common miner receives the value of three shillings and six-pence a week; but many of them are afflicted with a nervous disorder, accompanied with violent tremblings, sudden convulsive motions of the hands and legs, and frightful distortions of the face. Those are most subject to these disorders who work in the places where virgin mercury is found, which in a surprising manner insinuates itself into their bodies; so that when they go into a warm bath, or are put into a profuse sweat by steam, drops of pure mercury have been known to issue through the pores from all parts of the body. These mines are often infested with rats and mice, which feed on the crumbs of bread, &c. dropped by the miners at their meals. But this plague seldom lasts long; for even they are seized with the like convulsive disorders as the men, which soon kills them. It is esteemed a necessary precaution for every person to eat before he descends into these subterraneous regions.

All the adjacent country is very woody; but that the woods may not be destroyed, great quantities of fuel for the smelting furnaces are annually brought down the river Idra, or Idrizza, from some forests that lie about five or six miles distant. Besides this river, here is a canal about two miles in length, supplied with water by several streams issuing from perennial springs, in order to put in motion the machines belonging to the mines.

The next town we shall mention is that of Fiume, or St. Veit, which is situated on a bay of the Adriatic Sea, called the gulph of Carnero. It is seated in a valley, and is famous for good wine, figs, and other fruit. It is populous, and contains an arsenal, a cathedral, and a Jesuits college; with two convents within the town, and one without it near the sea. The harbour is formed by the river Finmara, and from thence large quantities of goods are exported, a considerable part of which come from Hungary, on which account an expensive highway has been made from this place to Carlstadt in Croatia. It is separated from the dutchy of Carniola, and under the government of a captain, who resides at the citadel. The gulph of Carnero abounds in fish, among which is a sort called gatto, which grows to a considerable size, and of its skin is made a kind of shagreen, used for the cases of watches, caskets, telescopes, and the like.

Trieste is pleasantly situated on a hill, and forms a semicircle, which is encompassed with vineyards. The town is but small; however on the south-west side, where formerly were salt-pits, a beautiful suburb has been erected. The castle, which stands on an eminence, is surrounded with a ditch, and the fortifications have been considerably improved. The Jesuits church is a handsome structure, but has neither good paintings, nor any other ornaments worthy of notice. In the church near the castle are two chapels, adorned with a great deal of old mosaic work. The streets of the town are narrow and uneven, except in the market-place, where there is a very convenient walk. The inhabitants of Trieste are accused of being lazy and proud, of never applying themselves to any useful employment, and of being so malicious, as to molest and injure strangers to the utmost of their power. This town, which stands on the borders of Italy, is situated in the forty-sixth degree ten minutes north latitude, and in the fourteenth degree twelve minutes east longitude, only fifty-eight miles to the north-east of Venice.

S E C T. XIV.

Of the County of TIROL.

Its Extent; Situation, Mountains, Rivers; with a particular Description of the Channel of the Inn, and the Face of the Country. The Appearance of the Peasants; and a Description of the principal Places in Tirol.

THE next division of Austria is that of the county of Tirol, which is one hundred and fifty miles in length, and one hundred and twenty in breadth; and is bounded on the north by Bavaria; on the east by Carinthia and the archbishopric of Salzburg; on the south, by part of the territory of Venice; and on the west, by Swisserland, and the country of the Grisons.

The passes into this country, where all travellers are obliged to take passports, are entirely surrounded by a continued chain of mountains, so that at a distance you are often at a loss to distinguish the passage; and when after many windings, you come to an opening, you find it secured by strong forts. It is said that seven thousand men could defend the whole country against the attempts of any number of men. In several parts, particularly before noon, not only light mists, but heavy clouds, are seen resting in the middle of a mountain; higher up it is quite clear, till at the summit, it is again enveloped in clouds; "a sight," says Mr. Keyser, "which sometimes gave me an idea of mount Sinai, at the promulgation of the law."

But though the mountains of Tirol have their tops constantly covered with snow, they are very fertile, and have not only the finest woods, abounding in a variety of game, but also large corn-fields; and where the mountains are barren, there are generally either mines or quarries of excellent marble of all colours. On the eminences grow all sorts of the fine fruits that Italy affords, and also woods of chesnut trees. The country likewise yields flax, and produces excellent wine. There are found in this country granates, rubies, amethysts, emeralds, agates, cornelians, chalcedonies, and a species of crystal so hard as to be used instead of diamonds for cutting glass. It has in some places profitable salt-pits, and in others mines of copper, silver, lead, allum, and vitriol. Hence it is one of the most profitable parts of the territories of the emperor; and it was not without reason that Maximilian I. used to say, "Tirol is like a peasant's coat, very coarse, indeed, but also very warm."

It produces a good breed of horned cattle and horses, and among the wild beasts are the chamois and wild goats. The chamois, or shamoy, goat is properly a native of Tirol, as well as of the principality of Salzburg. The huntsmen have sharp crooked pieces of iron on their shoes, and sometimes fastened to their hands, for the better pursuing this swift footed animal among the rocks and mountains.

The principal rivers in this country are the Inn, which receives a number of lesser streams, and entering Bavaria falls into the Danube. The ingenious Mr. Addison says, "It was the pleasantest voyage in the world to follow the windings of this river, through the variety of pleasing scenes to which its course naturally lead us. We had sometimes on each side a vast extent of naked rocks and mountains, broken into a thousand irregular steeps and precipices. At other places we beheld a long forest so thick set together that it was impossible to discover any of the soil they grew upon, and rising up so regularly one above another, as to give us the view of a whole wood. The time of the year that had given the leaves of the trees so many different colours, completed the beauty of the prospect."

The other rivers of Tirol are the Etsch, which also rises in this country, and traversing the bishopric of Trent, and the territory of the republic of Venice, at length falls into the Adriatic sea. The Lech which rises here, and after passing through Tirol, forms the limits between the circles of Swabia and Bavaria, and at length falls into the Danube.

In this country are twelve towns and ten villages that have markets. The common people live chiefly by working in the mines and salt-works.

The meaner sort of peasants make so wretched an appearance, that one would almost take them for gypsies: both the men and women wear hats of all colours. Their farm-houses, barns, and stables are also very mean, when compared with those of other countries, and are only covered with boards placed almost horizontally, on which are laid heavy stones to secure them from being blown off.

The inhabitants have, however, many particular privileges above those of the other hereditary dominions of the house of Austria: for being naturally well fortified by their mountains, and bordering upon many different governments, as the Bavarians, Swiss, Venetians, Grisons, &c. were they treated with severity, they might be tempted to set up for a republic, or at least throw themselves under the milder government of some of their neighbours. The country is, however, poor, though the emperor draws considerable sums out of its mines of salt and metal; and these mines fill the country with greater numbers of people than it would be able to support without the importation of foreign corn.

The arms of this country are an eagle gules in a field argent.

Tirol is governed by three councils, which are held at Inspruck, one of which sits upon life and death, the other regulates the taxes, and the third manages the affairs of justice: but as these courts are guided by the orders they receive from Vienna, there are in many cases appeals from them to the emperor. It contributes yearly a hundred thousand florins towards the military state of the house of Austria.

The principal places it contains are,

Inspruck, the capital of the whole country, which is a handsome city, formerly the residence of the archdukes of Austria, who are counts of Tirol. It is seated on the river Inn, within the forty-seventh degree thirty-eight minutes latitude, and the eleventh degree thirty-nine minutes east longitude, and stands in a fertile plain environed with mountains. Though Inspruck be small, it is a fine city with well paved streets, and stately flat-roofed palaces, after the Italian taste. Here are no less than twelve churches, including those in eight convents, and the two suburbs, which are much larger than the city itself, and are finely built. The city is adorned with curious fountains, spacious market-places, and the castle, or palace; but is of small extent within the walls. The great hall of the palace is a very noble room, the walls being painted in fresco representing the labours of Hercules, many of which make a very fine appearance, tho' great part of the work has been cracked by the earthquakes, which are very frequent in this country. The famous golden roof in the palace consists of copper-plates richly gilt, at the expence of two hundred thousand dollars. Near this palace is another of wood, to which it was usual for the court to retire at the first shock of an earthquake. In one of the rooms of the palace, which is hung with the pictures of illustrious persons, they shew the portrait of Mary queen of Scots, who was beheaded in the reign of queen Elizabeth. The gardens are very large, and in the middle of them is a beautiful equestrian statue in brass of the archduke Leopold, and near it twelve figures of water nymphs and river gods, well cast and as big as the life. Covered galleries lead from the palace to five different churches, and a very long one reaches to the church belonging to the Capuchin convent, where the duke of Lorraine used frequently to assist at their midnight devotions. In this convent are shewn the apartments of Maximilian, archduke and count of Tirol, who, while he kept the government in his hands, lived in this convent with all the rigour and austerity of a Capuchin. His room of audience and anti-chamber are little square wainscotted rooms, faced with a kind of fret-work, that gives them the appearance of little hollow caverns hewn out of a rock.

The church belonging to the Franciscan convent was erected by Ferdinand I. and is a kind of attempt at mo-

dern architecture. But though the architect has shewn his dislike of the Gothic taste, it is easily seen that in that age the people, at least in this country, were not arrived at the true knowledge of that simplicity observed by the Greeks and Romans. The portal, for instance, consists of a composite order unknown to the ancients; for though the ornaments are taken from them, the volutes of the Ionic, the foliage of the Corinthian, and the uovali of the Doric order, are mixed without any regularity in the same capital. The vault of the church is incumbered with many little pieces of sculpture; and tho' it is supported with single columns, instead of the clusters of little pillars found in Gothic cathedrals, these columns are of no regular order, and are at least twice too long for their diameter. In the middle of it is the monument of the emperor Maximilian I. which was erected by his grandson Ferdinand I. but the body of the emperor lies elsewhere. On the top of this monument is the figure of Maximilian kneeling, in brass, surrounded with four other smaller metal figures representing the virtues, and on the monument itself is a beautiful basso relievo of white marble, representing the exploits of that prince in twenty-four square pannels of sculpture. In the middle passage of the church are twenty-eight brazen statues ranged in two rows, and larger than the life, representing the regal and princely personages, male and female; in particular those of the house of Austria, and on the cornice of the vaulted passage, which separates the choir from the nave of the church, stand twenty-three small statues of brass.

Among the other churches is a little Notre Dame, which is handsomely designed and covered with a cupola. This church was built by the contributions of the whole country, and was designed as an expression of gratitude to the Virgin Mary, for having defended the country of Tirol against the victorious arms of Gustavus Adolphus, who was unable to enter this part of the empire, after his having over-run most of the rest.

The regency and provincial houses here are fine structures. In the suburbs is an arsenal; there is also an university, a cloister of Capuchins, and two monasteries.

At a league's distance is the town of Hall, which is a pretty place seated on the river Inn, and contains a mint that is worked by water, a parish church, a college of Jesuits, a Franciscan cloister, and a royal foundation for ladies. But this town is most famous for its salt-works. In the neighbourhood of this town are vast mountains of rock-salt, where four or five hundred men are constantly employed; and as soon as they have hewn down a sufficient quantity of the rock, which in colour resembles allum, and is extremely solid, they let in their springs and reservoirs among their works, where the water dissolves the particles of salt mixed with the stone, and is conveyed from thence through long troughs and wooden canals to Hall, where it is received in vast cisterns, and from time to time boiled off. The salt-works of this town have great convenience for fuel, which is brought down to them by the river Inn; and, during its course through Tirol, is generally enclosed between a double range of mountains, most of which are covered with fir-trees. Great numbers of peasants are employed in felling the largest of these trees, which, after they have barked and cut into shape, are tumbled down from the mountains into the river, which carries them off to the salt-works: vast quantities of them are likewise taken up at Inspruck for the use of the convents and the public offices, who are allowed a certain portion of them by the emperor, and the rest pass on to Hall. Several hundred loads of this timber are generally on float; for they begin to cut twenty leagues up the river above Hall; and other rivers that flow into the Inn bring in their contributions. The above salt-works, with the mint established at the same place, have rendered Hall almost as populous as Inspruck. This mint is designed to work part of the metals obtained in the neighbouring mountains, where seven thousand men are said to be constantly employed in the mines.

Schwatz is a very considerable market-town, situated in the jurisdiction of the same name; it stands on the Inn, and exceeds most towns in the country in beauty. Near it is a mine-work of silver and copper, in which a thou-

a thousand men are employed. This mine was discovered in 1448, and was formerly much richer than it is at present.

In this province is the pass of Kofel, in Italian Covelo, which lies on the borders of the territory of the republic of Venice. In it is a high and steep rock, which rises fifty fathoms like a wall, and in the middle of it is a cavity which contains a spring, on which a castle or fort has been erected. It has a small garrison, which must be wound up and let down by ropes. Below it is a narrow pass, in which two carriages can scarce go abreast; and on the opposite side is the steep shore of the river Brent. At the beginning of this pass is a bulwark, or bastion, the guard of which is let down from the castle. Hard by is the village of Primolano, about a gun-shot from which is a lazaretto, where travellers in the time of the plague perform quarantine. This place lies quite lonesome, between mountains and cliffs of an uncommon height.

The next town we shall mention is that of Meran, which is situated on the river Passer in the most fertile part of the district of Etsch, and contains six churches and cloisters. It was formerly the capital of the country, and even still, on public occasions, takes precedence of all the towns. Near it antiently stood a town, which in the middle age was quite overwhelmed by the fall of a mountain.

Bozen, by the Italians called Bolzano, is situated in a pleasant valley twenty-five miles to the north of Trent, and stands on the river Eysock. This city contains several religious houses, and the monasteries of the Franciscans and Dominicans have churches. The most remarkable thing in the great church is a round hole in the roof three feet in diameter, surrounded with a garland of ribbons of different colours, with large wafers appendent to them; and Mr. Misson was told, that a sacred opera being acted in that church on Ascension-day, the person who represented Christ was taken up to heaven through this hole. This church has a high steeple, adorned with three stories of balustrades of very good workmanship. The houses are all plaistered over, and a rivulet of spring-water runs through all the streets, which are generally straight and broad; but the town has no walls, nor any defence, except a large stream at its entrance, over which there is a bridge. It is a place of good trade, especially at its four annual fairs, that last each a fortnight, and to which great numbers of merchants come from all parts of Germany, Swisserland, and Italy; on which account great privileges have been granted to the city. During these fairs the merchants are allowed magistrates and judges of their own, distinct from those of the town, and none are permitted to trade without being entered in the judges books, and a certificate of the entry under the seal of the corporation.

The neighbourhood of this place, and indeed the whole valley of Bolzano, is full of villages, and vineyards planted in the form of arbours, with the branches of the vines tied to wooden frames; props not being used in this country. Their white wines are generally of a very agreeable tartness; but they must be drank the very year of their growth, or else they grow luscious, and then turn crabbed. At certain distances in this valley are little straw huts, each raised upon three trunks of trees or poles, from whence they shoot the bears that come from the mountains to eat the grapes.

S E C T. XV.

Of the Bishoprics of TRENT and BRIXEN.

Their Situation, Extent, and Produce; with a particular Account of Trent and Brixen, the capital Cities of this Country.

THE temporal jurisdiction of the bishop of Trent is situated in the county of Tirol, and the bishop enjoys, as an immediate prince of the empire, a seat at the diets: it is situated among the Alps, in the south part of Tirol, to the north-west of the dominions of Venice, and to the east of those of the Grisons. It is near sixty

miles in length from east to west, and forty, where broadest, from north to south.

The river Adige runs through the country from north to south, and receives several smaller rivers that rise in the mountains on each side. The soil produces a good wine that is of a pale red, with oil, fruit, and pasture; but not much corn. The common languages of the people are the German and Italian.

The city of Trent, the capital of this bishopric, stands on the river Adige, in the forty-sixth degree north latitude, and the eleventh degree twenty-nine minutes east longitude. It is supposed to have received its Latin name Tridentum from three sharp peaks or rocks of the Alps, which resemble three teeth, and hang over the city. It is built on a flat rock of a kind of red and white marble, which also furnishes the materials for their houses; but is subject to dangerous inundations, not only from the overflowing of the river, but from the brooks of Levis and Fersena, which sometimes precipitate themselves from the adjacent mountains, and force great rocks along with them even into the town.

The city is encompassed with steep impassable hills, except the Tirol road on the north, and that to Verona on the south. The sun-beams darted from these flinty rocks, render the heat as intolerable as the snow on their tops makes the air cold in winter; but in spring and autumn the air is temperate. The town is small, but pretty populous, and defended by an old castle. The streets are broad and well paved, and have many stately palaces, beautiful churches, and religious houses. The cathedral dedicated to St. Vigil is a fine piece of Gothic architecture, supported by marble pillars of an extraordinary height and thickness; but the inside is too dark. It has a chapel, in which nothing is to be seen but marble and sculpture, and is said to have cost a hundred thousand crowns. In one of the chapels of this cathedral is shewn a crucifix as big as the life; and they gravely assert, that it bowed its head at the time of the council's being sworn and proclaimed under it, to shew its approbation of the veracity of their decrees.

The church of St. Mary Major is noted for the famous council of Trent, held there from the fourth of January, 1545, till 1563, the representation of which is finely painted on the walls. The church is also famous for an organ, which is said to imitate all sorts of instruments and the singing of birds, with the cries of several beasts, and the sound of drums and trumpets so naturally, that it is hard to distinguish them.

We now come to the bishopric of Brixen, which is by the Matricula placed in the circle of Austria, and, as it forms a part of the Tirolese, is subject to the house of Austria. This country is bounded by Saltzburg and part of Carinthia on the east, by Trent and the dominions of Venice on the south, and joins the Tirol on the north and east, extending about forty-five miles in length, and thirty in breadth.

The city of Brixen is situated on the river Eysock, at the foot of Mount Brenner, in the forty-sixth degree thirty-eight minutes north latitude, and the eleventh degree forty-nine minutes east longitude, in a fine country abounding in vineyards, that yield excellent red wine. It is adorned with spacious squares, a very handsome palace, a town-house, a cathedral, two churches which join to each other, and two convents. It has also a castle seated on an eminence. It is a populous town much frequented on account of the mineral springs in its neighbourhood. The houses are well-built, and are almost all of the same size: they are adorned with porticos, and curiously painted on the outside; but their shops are kept in vaults, which run from one side of the street to the other. The bishop's palace, which forms one side of a fine square over-against the two churches, is encompassed with a ditch, and defended at the entrance by four brass cannon.

The country between this city and Bolzano is extremely populous, and so well manured, that the steepest mountains are cultivated. The men of Brixen are reckoned more genteel and civilized, and the women handsomer, than in any other part of Tirol. The Virgin Mary and St. Christopher being the principal objects of

the people's devotion, the roads are full of little chapels of the Virgin, and St. Christopher is painted on all their houses. This city has its own magistrates, who are two burgomasters and twelve council.

We shall defer treating of that part of Swabia subject to the house of Austria, till we come to the circle of Swabia.

C H A P. X.

Of the Kingdom of BOHEMIA, including MORAVIA.

S E C T. I.

Its Name and Situation; the Face of the Country of Bohemia; its Minerals and Fossils, Vegetables and Animals; its Rivers and Highways, Towns and Villages. Of the Inhabitants, the Hardships under which they labour, their Language, Religion, and Government.

SOME authors include under the name of Bohemia in general the kingdom of Bohemia, Moravia, Silesia, and Lusatia, which lie together in the form of a lozenge, between Austria on the south, Brandenburg on the north, the palatinate of Bavaria, with part of Saxony, on the west, and Poland on the east, extending in its greatest length and breadth two hundred and seventy-six miles from north to south, and two hundred and sixty from east to west.

But however convenient it may be for geographical writers thus to class countries that have little or no relation to each other, it can only serve to mislead the mind and confound our ideas; for neither Silesia nor Lusatia can properly be considered as provinces of Bohemia; the greatest part of the former being subject to the king of Prussia, and the latter divided between the elector of Saxony, the king of Prussia, and several other princes. We shall therefore confine this account of Bohemia to the kingdom of that name, including Moravia; but shall treat of each separately, beginning with the former.

Bohemia, in German Boiherheim, Boiheim, and corruptly Bohmen, that is the abode of the Boii, obtained its name from the Boii, its antient inhabitants, who were a tribe of the Celtæ, that retired into the Hercynian forest, which extends through this country, rather than submit to the Roman yoke, and is bounded to the north by Misnia, Lusatia, and Silesia; to the east by Moravia, Silesia, and the county of Glatz; to the south by Bavaria and Austria; and to the west by Bavaria and Franconia.

It is on all sides encompassed with high mountains and thick extensive woods, yet the country lies high, tho' it is for the most part level, and enjoys a warm, pleasant, and wholesome air; a soil in some places fat, and in others sandy. In the bowels of the earth are found isinglass, coal, allum, sulphur, and sealed-earth: there are here some mines of silver, tin, copper, lead, quicksilver, and iron; salt-petre is also found here, and all kinds of marble are dug in Bohemia. Among the precious stones are a kind of diamond which have a beautiful lustre, but want a proper hardness, which is also the case with the rubies and crysolites found in this country; here are likewise emeralds, granates, sapphires, topazes, amethysts, hyacinths, berils, carbuncles, jasper, chalcedonies, turquoises, and cornelians.

Bohemia is very fertile in corn, considerable quantities of which are exported, particularly buck-wheat and millet. It also abounds in garden and orchard fruits, and produces excellent red wines, with saffron, ginger, and calamus. It likewise yields good pasture, which feed numerous droves of cattle, and has excellent chaces. Among the wild beasts are lynxes, bears, wolves, foxes, martens, badgers, beavers, and otters; and there are here plenty of wild fowl.

With respect to the principal rivers of the country, the Elbe rises in Bohemia, and becomes navigable at Leut-

meritz: at Melmic it receives the Moldaw, and near Leutmeritz the Egra.

Ten principal highways, leading from Prague through the whole country, are made in a direct line, and in many places secured by masonry, the hollow parts being filled up, and on both sides deep trenches are cut for carrying off the water. This useful labour cost some millions of florins.

Bohemia was formerly well supplied with towns, boroughs, villages, castles, and men; but it at present appears extremely desolate when compared with its former state. During the intestine religious wars, and the succeeding eruptions of the Swedes, most of the towns, castles, and villages, were laid waste; so that at present it contains only one hundred and five great and small towns. These are Prague, the capital, with thirty-one royal towns, nine royal dowry or jointure ones, two common mine towns, three royal mine towns, twelve exempted mine towns, and forty-seven baron towns, with not much above six thousand villages.

The number of inhabitants is likewise considerably decreased: according to Balbin, there is not the tenth part of the people by which it was formerly inhabited, and Modern Bohemia is scarce the shadow of what it was antiently. In 1622, and the three or four succeeding years, thirty thousand families quitted this country, not to mention women, children, handicraftsmen, and the greatest part of the nobility, who also retired; whence an attentive traveller finds the towns, boroughs, villages, and highways of this country extremely desolate.

The peasants here are bondmen to their lords, and the hard yoke by which they are galled, appears to be the cause both of their stiff-neckedness and of their indolence; the latter being very observable by the wretched condition of their villages. In 1679, the heavy bondage they laboured under induced a great part of them to take arms, but for this they were wholly stripped of the small remains of liberty they enjoyed.

The owners of free estates are but few in number. The landed estates belong to the prelates, lords, knights, and towns. The prelates here are the archbishop of Prague, with the bishops of Leutmeritz and Konigin-gratz, the canons and capitulars of the metropolitan church of St. Vitus in the citadel of Prague, with many others. The lords consist of princes, counts, and barons.

The Bohemian language is a dialect of the Slavonic, but is harsher than that of the neighbouring people who speak that language.

The Bohemians are supposed to have embraced the Christian religion so early as the sixth century; but it is more certain that they were instructed in it by the Greek brethren Methodius and Cyril, about the middle of the ninth century; hence the Greek religion and customs were in use among them till the Romish method of worship was introduced by Boleslaus the Good. In the fifteenth century John Militz preached against the pope and the abuses of the clergy; Matthias Janow trod in his steps, and was followed by John Hufs, Jerome of Prague, and Jacob Von Misa, who in the fourteenth, and more particularly in the fifteenth century, opposed many doctrines of the popish church. This brought Hufs and Jerome to the stake, and put their adherents, most of whom were Bohemians, under the ban; upon which

account

account they were so irritated, that they raised a bloody war, which continued for many years. They pitched their camp on a mountain for the security of themselves and their religious assemblies, which gave occasion to their being called Taborites; Tabor in the Bohemian tongue signifying a camp. A part of the people, who were principally desirous of participating in the cup at the Lord's Supper, obtained the name of Calixtines, and after the death of Ziska, their general, a part called themselves Orphans. The Calixtines, in the year 1433, obtained the use of the cup, which was permitted to every one; but in other respects they complied with the church of Rome. The Taborites, on the contrary, could neither be brought over by allurements, threatenings, nor persecutions, to the Romish church; but improving their doctrines and church discipline, and laying aside war and disputes, called themselves the Bohemian Brethren; but, in 1547, the greatest part of them being banished, retired to Poland and Prussia. In the sixteenth century the opinions of Luther spread in Bohemia, and the greatest part of the Calixtines embraced that religion. In 1575 Maximilian II. allowed every one full liberty of conscience, which was granted in stronger terms in 1609, by Rodolphus II. when they were not only permitted the free exercise of their religion, but the use of the university of Prague. These privileges were confirmed by Matthias I. in 1611, and Ferdinand II. was admitted to the throne only upon condition of his confirming them by oath; but in 1617 he entered into an agreement with Philip III. king of Spain, without the consent of the states, that he, with all his descendants, after the extinction of the male archducal stock of Austria, should possess the hereditary succession in Bohemia. This terrified the Lutheran Bohemians, who had besides so many complaints to prefer, that their deputies, in 1618, obtaining no favourable answer to their representations in the royal chancery at Prague, they, in the heat of their passion, threw two of the royal counsellors, with a secretary, out of the window, as betrayers of their country; and no regard being paid to their complaints, they created the palgrave Frederic king, and took up arms in their own defence. Hence arose a dreadful war, which ended very unhappily both with respect to the new king and the protestant Bohemians; for in 1627 they were deprived of all their rights and privileges; and those who would not submit to the Romish church, were compelled to quit the country. From that time the church of Rome became the only prevailing religion in Bohemia; and though the Jews at Prague are indulged in the exercise of theirs, the few Lutherans were afterwards obliged to conceal themselves as much as possible.

The archbishop of Prague is legate of the see of Rome, a prince of the Roman empire, primate of the kingdom, and standing chancellor of the university of Prague, and has for his suffragans the bishops of Leutmeritz and Koniginratz. The archiepiscopal consistory has the supreme jurisdiction over the clergy, and from it lies an appeal, either to the king or the pope.

Learning is at a low ebb in this kingdom; nor do the Bohemians apply themselves much to the fine arts. They, however, make good cloth, fine potters work, good blades for swords and knives, fine paper and glass.

With respect to commerce, they export a considerable quantity of corn and malt into Saxony and Bavaria. Hops and the Spaw waters of Egra are also plentifully exported from this kingdom, and likewise paper, pottery, and beautiful glass; but their commerce is in general inconsiderable.

With regard to the government, Bohemia is at present an hereditary kingdom, but was formerly elective, though the states usually kept to the family of the deceased king. Ferdinand I. in 1547, declared the kingdom hereditary by a conclusion of the diet, and it fully became so in 1620, from which time the states have had nothing to do with respect to the right of succession.

We have already observed, in treating of Germany in general, that the king of Bohemia is arch-cup-bearer to the holy Roman empire, but he does not add that office to his other titles. He has for hereditary cup-bearer of the empire the counts of Althan, who therefore bear a cup in their arms. On the death of the emperor

Charles VI. great debates arose concerning the person who at the election of a new king of the Romans, should represent the electoral voice of Bohemia. Queen Maria Theresia had conferred the sovereignty on her consort the great duke of Tuscany; but by a majority of votes in the electoral college, it was determined that the voice of Bohemia should remain dormant for that time. But after the death of Charles VII. the envoys of election of the queen of Bohemia were admitted to the choice of a new king of the Romans.

The arms of Bohemia are a lion argent, with a double tail, in a field gules.

The supreme officers of the empire are the supreme burgrave, land-steward, land-marshal, land-chamberlain, land-judge, aulic feudal-judge, president of appeals, chamber president, and supreme land register. The hereditary officers are principally the four following, the supreme hereditary marshal, the sewer, the cup-bearer, and the steward.

The aulic chancery of Bohemia, which constantly follows the court, was united in 1749, with that of the Austrian at Vienna, and the government of Prague is abolished; there are, however, several courts of judicature held there. The circles and towns in Bohemia have also their peculiar judicatories, and the lords their hereditary and feudal ones.

According to the new regulation, with respect to the military state of the Austrian hereditary countries, the annual contribution of the kingdom of Bohemia amounts to five millions two hundred and seventy thousand four hundred eighty-eight florins, forty-four kruiters.

The kingdom of Bohemia is divided into twelve circles, and the territory of Egra, but does not contain many towns so considerable as to deserve a particular description; we shall therefore begin with the capital of the kingdom.

S E C T. II.

A Description of the City of Prague, with a concise Account of the Inhabitants of that Metropolis.

THIS city is seated almost in the middle of Bohemia, in the fiftieth degree five minutes north latitude, and the fourteenth degree forty minutes east longitude. It extends on both sides the Moldaw, which is here about eight hundred paces broad; but shallow, and not navigable. The stone bridge which joins the two parts of the city on the opposite banks of the river, was erected by Charles IV. in the year 1357, and exceeds in length those of Dresden and Ratisbon, it being one thousand seven hundred and seventy feet long: its breadth amounts to thirty-five feet; three carriages may pass upon it abreast, and it has a strong tower at each end. It is raised on sixteen piers, and adorned on the sides with twenty-eight statues of saints. The crucifix with the two female statues that stand under it, and that of St. John of Nepomuck, are of metal; but the others are of stone. This Nepomuck, king Wenzel caused to be thrown from the bridge into the river, and drowned in 1683; but in the year 1729, he was not only ranked among the saints, but adored with such veneration, that almost all the other saints are on his account forgotten in Bohemia.

The fortifications of the city are pretty strong. The houses are built entirely of stone, and for the most part consist of three stories. The streets are broader than those of Vienna; but it has not so many magnificent palaces. It is computed to contain ninety-two churches and chapels, with about forty cloisters. The town, considering its extent, is not sufficiently populous, it containing only about seventy thousand Christians, and between twelve and thirteen thousand Jews. Nor is its commerce very considerable; for exclusive of the arts and handicraft trades, its principal means of subsistence is drawn from the brewing of beer. It comprehends three towns, the Old, the New, and the Little Town.

In Old Prague the Jesuits have a magnificent college, which is one of the largest belonging to their order, except that of Goa. It is called *Collegium Clementinum*, from

from St. Clement's church which joins to it, and two hundred and ten priests of that order constantly reside there. They have also another college in the New City, and in the Little City, they have a college, and two seminaries. Their schools are very full, and the number of students in the twelve classes of the Clementine college amounts to no less than eighteen hundred. The library of the Clementine college is worth observing, being very light and lofty, and adorned with galleries. The mathematical cabinet built here has a moving armillary sphere, according to Tycho Brahe's system, and a large sextant made by that celebrated mathematician. In the tower of the Clementine college is an observatory, from which there is a fine prospect of the city. On the top of this tower is a statue of Atlas, supporting an armillary sphere.

In the church near the Trinhoff is the monument of Tycho Brahe, over which is his usual motto in large characters, ESSE POTIVS QUAM HABERI. That is, "To be rather than seem to be;" and underneath a long inscription mentioning his various discoveries. Under this, Tycho Brahe is represented in basso relievo dressed in armour, with a long sword by his side, a band and whiskers: he leans with his right hand on a celestial sphere, placed over his coat of arms, and on his left is his helmet.

The church of the cross near the Jesuit's college in the old city is an elegant piece of architecture, adorned with fine marble columns, and beautiful paintings. On the church, which stands in Charles's square, is a *scala santa*, built of Bohemian marble. The high altar is embellished with sculpture in wood, which is well executed; but the walls of the church are entirely covered with votive pieces, some of which are wretched daubings designed for pictures, others filthy rags, coats, &c. which give the church a very disgusting appearance.

The cathedral, which is dedicated to St. Vitus, and stands on the castle hill, is very rich in plate, altar furniture, and relics: among other valuable ornaments is a crucifix of Hungarian virgin gold, that weighs ten thousand ducats. Some have represented St. Wenceslaus's chapel in this structure, as if the walls were entirely covered with jasper, amethysts, and cornelian; every thing indeed is there very rich, but falls short of this exaggerated account. Indeed, a considerable part of the wall is covered with these gems, some of which are as big as a man's fist; but irregularly set without any order; and as for the embellishments of gold, and the like, their value is much more owing to the metal, than the skill of the artificer.

Upon a fountain within the area of the citadel is a brass statue of St. George, cast in the year 1373, and making allowance for the age in which it was produced, it may be reckoned a very good one. The prospect from the royal apartments is quite charming, and the hall where the emperor entertains the nobility well contrived, and very splendid.

Facing the Capuchin church is an edifice, built in the imitation of the *casa santa* at Loretto, the walls of which are like that, black and smoaky within; but on the basso relievos on the outside, there is a very great difference, these being only of plaister, and those of the holy house at Loretto of marble, and the workmanship is as far inferior to the latter as the materials. The treasure collected in this chapel is very extraordinary. Among other valuable offerings are the following: a pyx set with pearls of the size of an acorn, one of which in the middle is shaped like a heart, and is of the size of a middling walnut, another is enriched with six thousand six hundred sixty-six diamonds, representing the sun. The size of the diamonds gradually decreases, and they are curiously arranged, in order to form the solar rays, which terminate in a point, consisting of one single stone. It cost two hundred thousand guldens, and the artist who made it, and was employed ten years before it was completed, was rewarded with ten thousand.

In the middle of the horse-market, which is a large square, is an equestrian statue of king Wenceslaus, and on one side of the area, before count Czernini's palace, is a stone pillar in memory of Drahomira, a pagan dutchess of Bohemia, the mother of St. Wenceslaus,

whom the earth swallowed up on this spot, in the year 939.

A white tower in this city serves for a state prison, and it is said there was formerly in one of the rooms a curious machine, made in the shape of a woman, which when any delinquent was brought near it, would embrace him, and with its arms instantly break his back and ribs; but no such thing is now to be seen.

Prague has been frequently besieged, and obliged to surrender; particularly in the year 1631, it was taken by the Saxons, and in 1741, by the elector of Bavaria. In 1742, the Austrian forces invested the city, in which were about twenty thousand French, commanded by the marshals Broglie and Belleisle, who suffered greatly by famine; but defended themselves with great bravery, and at length found means to make their escape. In the year 1744, the Prussians made themselves masters of this capital, after cannonading it seven days; but quitted it the same year.

The inhabitants of Prague are poor, and their shops but meanly furnished. The people of quality, who cannot easily bear the expence of Vienna, chuse to reside here, where they have assemblies, music, and all other diversions, except those of a court; provisions are extremely cheap, and they have plenty of the most excellent fowl. The women of quality now dress pretty much in the French mode; but those of the Jews have a distinct habit. The wives of the wealthy citizens wear fur caps and long cloaks, some of them satin lined with taffety, and petticoats of the same; but short, on account of the dirtiness of the streets.

S E C T. III.

The other principal Towns in Bohemia.

IT has been already intimated, that war and persecution have rendered the kingdom of Bohemia extremely desart, in comparison with what it was formerly, and therefore, though there are many towns and villages, there are few worthy of notice. The country is, however, divided into twelve circles, some of the principal places in which are the following.

Pfaundorf is the first town in Bohemia on the side next Vienna. At Deutschbrod the baggage of travellers is searched by the Bohemian custom-house officers. In the road from hence to the pretty town of Jenkow, you have a delightful prospect of a fine level country on each side, which is interspersed with above fifty little villages and small towns. Dzaslow, which is six miles farther on this road, is also a very pretty town, and has a large square market-place.

Melnic, a small royal jointure town, is seated on an eminence in the circle of Bunzlau, near the conflux of the Elbe and Moldau; it has a collegiate church, and is defended by a castle.

Konigingratz, a royal jointure town in the circle of the same name, is seated on the Elbe, and is a bishop's see, suffragan to the archbishop of Prague. The town is pretty large, and has a college of Jesuits, and a commandery belonging to the knights of the Teutonic order. It has been several times besieged and taken.

Pardubice, a royal town in the circle of Chrudim, is fortified, and its citadel is a fine structure. The town is well built, and the inhabitants make excellent blades for swords and knives. This town has the privilege of holding fairs.

Crumau, or Crumlow, a well built fortified town, seated on the river Moldau. It has a beautiful citadel and college of Jesuits. This town, with the seigniorie annexed to it, bears the title of a dutchy.

Elnbogen, a royal borough, seated together with its citadel, on a high and steep rock, by which it is also environed. The river Eger, which rushes by the left side of this rock, here forms a curve resembling an elbow; and hence the town receives its name. The way which leads to it is very narrow, but it has sometimes been besieged and taken.

Five miles to the east of Elnbogen is Carlsbadt, or Charles's Bath, which is famous for its medicinal waters,

ters, of which there are two forts, that differ both in heat and strength, and are distinguished by the names of the Sproudel and the Muhl bath, the first of which are boiling hot, and the latter little more than luke-warm. They are both bathed in and drank, and on several occasions at one and the same time. They were first discovered in the year 1370, and take their name from the emperor Charles IV. They are recommended for many diseases, particularly the gravel and barrenness in women. Several eminent physicians have wrote upon them, and on the manner in which they ought to be used. The method of drinking them is very disagreeable; for let the weather be ever so hot, the patient is obliged to be shut up in a room heated with a stove, and to drink two or three large pots of water hotter than those of the king or queen's bath in Somersetshire, and to walk about while the sweat trickles down in drops. For this reason, people seldom stir out till three or four hours after they have drank the waters; and the rest of the day it is absolutely necessary to walk about, to prevent sleeping, which after dinner is dangerous: yet the walks are narrow, and afford no prospect but of barren rocks, except only one square place planted with rows of lime-trees, opposite to which is a great house, which has fine rooms, in which those who drink the waters play, dance, or walk from five to eight o'clock, the hour of supper. These baths are frequented by abundance of foreigners, and particularly the nobility and gentry of Austria, as well as those of Bohemia; but whoever would be well accommodated, must bring his own bed, wine, and cook with him.

The town itself is divided into two parts by the river Tappel, which runs through it; but it is a dirty place, chiefly inhabited by artificers in iron, whose works are very neat, and extremely cheap.

Carlstein is a celebrated citadel that stands on a mountain about fifteen miles distant from Prague. It is strong both by art and nature, and was built by Charles IV. to be the depository of the regalia of the kingdom. In it is a well two hundred and forty-four feet deep. It was besieged by the Hussites in the year 1422, from the twenty-eighth of May to the eleventh of November, but without success.

Leutomeritz is a considerable town on the Elbe, thirty-five miles to the north-west of Prague, and is a bishop's see suffragan to the archbishopric of Prague. It was garrisoned with French forces by the late emperor Charles VII. but was taken by the troops of the queen of Hungary in 1742.

The last town we shall mention in Bohemia is that of Egra, or Eger, the principal place in a territory of the same name. It is a beautiful and well fortified town, situated on the river Eger: it has a college of Jesuits, and three cloisters. This town retains its antient rights and privileges, and particularly that of coining money, which, however, passes only within its own district. From the judicial sentences of the town-council an appeal lies only to the king. Egra has been frequently besieged and taken: in the year 1742 the French made themselves masters of it, and kept it till the next year, when, after a long blockade, they were obliged to surrender. In the town are a number of ingenious artists, and its mineral waters are very famous.

Upon the roads in this country the traveller seldom fails of meeting with good provisions in the inns, as ducks, capons, pheasants, partridges, and hares; but the lodging is far from being answerable to the other entertainment, it being generally only some clean straw spread on the floor, with a bolster or pillow for the head. In the houses of the peasants there is a place walled in behind the stove, to which they ascend by a few narrow stone steps, as into a cock-loft, and in this warm apartment sleep away the cold winter nights very comfortably.

S E C T. IV.

Of the Marquisate of MORAVIA.

Its Situation, Extent, the Face of the Country, its Climate, Produce, and Rivers: the Manufactures and Religion of

the Inhabitants; with the principal Places in this Marquisate.

THE marquisate of Moravia is bounded on the north by Glatz and Silesia, on the east by Silesia and Hungary, on the south by Austria, and on the west by Bohemia; and receives its name from the river Morava, or March. It is a hundred and twenty-eight miles in length from east to west; and where broadest, about ninety-two from north to south. Towards Hungary, Silesia, and Bohemia, it is partly surrounded by mountains; and partly by woods. Above half of this country is mountainous and woody, and in the level tracts are many morasses, bogs, and lakes, where the water is unwholesome.

The air on the mountains is rough and so cold, that in many places the inhabitants use a stove for the greatest part of the whole summer. However, more corn grows here than is consumed by the inhabitants; here is also plenty of flax and hemp, nor are fruit-trees and garden-plants wanted. It likewise produces good saffron, and some white and red wine, particularly in those tracts that border on Austria and Hungary. Their pasture is good and feeds great numbers of cattle, and the extensive forests afford great plenty of venison, wolves, bears, and a species of leopards of the size of dogs; there are also some beavers. These forests likewise afford the inhabitants an opportunity of procuring a great deal of honey and wax by the breeding of bees.

In this country are quarries of marble amethysts, a kind of bastard diamonds, and other minerals; as also allum and mines of iron. This country likewise produces sulphur, saltpetre, and vitriol: here are wholesome mineral waters, and some acid springs.

The Oder rises in the circle of Olmutz, in this country. The river March, or Mora, or in Latin Morava, rises in the county of Glatz, and running from north to south, at length forms the limits between Hungary and Austria; but this river is not navigable. These and other smaller streams, as well as the lakes, yield various kinds of fish.

The sciences at present begin to flourish here. The principal commodities of the country are the cloth manufactory, iron-works, and glass-houses; the making of paper, gunpowder, &c. but the commerce of the inhabitants is very inconsiderable.

Christianity was settled here so early as in the eighth century; but in the fifteenth this country bore a considerable part in the commotions of the Hussites in Bohemia, and many embraced their opinions and called themselves Moravian Brethren; but in the sixteenth century most of them were obliged to fly. There are here at present not only some of them, but a few Lutherans and Calvinists, who make an external profession of conformity with the Romish church, though they privately hold separate assemblies, and, as opportunity offers, frequently fly to Protestant countries. Of late a new spirit of reformation appeared among the former, and a great number of converts, headed by a late count of Zinzendorf, have not only settled in England and several parts of Europe, but have removed for the sake of liberty to the British American plantations.

The whole marquisate is subject to the ecclesiastical jurisdiction of the bishop of Olmutz, who styles himself duke and prince of the holy Roman empire, and count of the royal Bohemian chapel, having formerly had a voice at the diets of the empire. He is at present immediately under the pope, and the episcopal consistory, which is the only ecclesiastical judicatory in all Moravia, enjoys the supreme jurisdiction over ecclesiastical persons.

Moravia contributes towards the maintenance of the military state of the Austrian hereditary countries, the annual sum of one million eight hundred and fifty-six thousand four hundred and ninety florins.

The whole marquisate is divided into six circles, each of which has its circle-captain, whose authority extends to the quartering, marching, and maintenance of the soldiers.

The principal towns in Moravia are,

S f

Olmutz,

Olmütz, the capital of the marquisate and of the circle of the same name, and the residence of the bishop, whose castle is a place of considerable strength, it being wholly surrounded by the river March. This town is populous and well built; it contains twenty-six churches, among which the cathedral church of St. Wenzel is worthy of notice, with five chapels, seven monasteries, and two nunneries, one college of Jesuits, an university, a riding-academy, several hospitals, and an orphan-house. The city has been frequently besieged, and in 1741 was blocked up for some months by the Prussians.

Kremsier, a well built walled town, seated on the river March, and belonging to the bishop of Olmütz. It has a collegiate church dedicated to St. Moritz, a college, several cloisters, and a mint. The large and beautiful palace in which the bishop usually resided was burnt down in the year 1752, together with the archives, the suburbs, and fifty-five burghers houses.

Brunn, or Brinn, is a royal borough in the circle of the same name. The town is not very large, but is well built, populous, and well fortified. It has the greatest

trade of any place in Moravia, and is the seat of the royal courts of justice and the diets. The bishop has a palace here, and within the town is also a college of Jesuits; six cloisters, among which is that of the Augustin hermits near St. Thomas's church, which is particularly famous for an image of the Virgin Mary, which they pretend was made by St. Luke. This place has sometimes been besieged and blocked up, but never yet taken.

Znain, or Znogma, a royal borough, situated in a pleasant spot near the river Teya; it is well built, and has a citadel, four cloisters, and a college of Jesuits. There are many vineyards in its neighbourhood that afford a palatable wine. It has been several times taken and retaken during the civil wars of Germany.

Iglau is a pretty large well built and populous town in the circle of the same name, seated on the river Iglau. It contains a college of Jesuits, with a Dominican and Franciscan monastery, and carries on a trade in beer and coarse woollen cloth. It has frequently been besieged and taken, and in the sixteenth century was the first of all the royal boroughs that embraced the opinions of Luther.

CHAP. XI.

Of the Dutchy of SILESIA and the County of GLATZ.

SECT. I.

Its Situation, Extent, Mountains, Climate, Fossils and Minerals, Vegetables, Animals, and Rivers.

SILESIA is bounded on the east by Poland, on which side the country is wholly level and open; to the southward it is separated from Hungary by a chain of mountains and a wild thicket, in some parts a German mile broad, and in others more or less: this thicket properly belongs neither to Silesia nor Hungary, though both countries have frequently attempted to make it their own; but it still remains a natural and impenetrable barrier both to Silesia and Hungary. Towards the west Silesia joins Moravia, Bohemia, Lusatia, and the county of Glatz. From the two first it is separated by a chain of mountains, but towards Lusatia it is level and open. To the northward it borders on Brandenburg, on which side it is likewise level and open.

It extends in length from the north-west to the south-east about two hundred and twenty-eight miles, and about a hundred where broadest; but it is much contracted at both ends.

Silesia is encompassed on the west and south by a chain of mountains, which, with respect to their height and extent, are some of the most remarkable in Europe, and is called by different names in the different countries by which it extends. In these mountains, and all over that part of Upper Silesia that lies towards Moravia and Hungary, the winter sets in earlier, is much more severe, and of longer continuance than in the plains. At the time when the country at the foot of these mountains is covered with ice and snow, the trees at Breslau are in full verdure.

The inhabitants of the mountains are not only confined to their houses by the snow, but like the Laplanders and people of Carniola, they use a kind of skates, by the help of which they pass over the snow with amazing swiftness.

In the mountains are found agate, jasper, and even amethysts of an uncommon hardness and beauty, and also crystals. They afford quarries of stone, and in some parts is pit-coal, while others afford turf for fuel. There are some mines of silver; vitriol is found in several places, and in others are mines of copper, lead, and iron.

The sandy parts of the country in the principality of Glogau, and beyond the Oder towards Poland, with the mountains tract, which is of considerable extent, pro-

duce little corn; but this deficiency is compensated by the fertility of the other and larger part of Silesia, which affords plenty of wheat, rye, barley, and oats, and also Turkey wheat, spelt, buck-wheat, millet, linseed, peas and beans. Several parts of the country produce excellent culinary vegetables, and afford plenty of fine fruit; even such spots as are unfit for tillage, either make good pasture grounds, or are covered with wood; so that there is scarce any part of Silesia that can be said to be entirely useless and barren. Here is abundance of flax, and some hemp; but not so much of the latter as is spun, considerable quantities being imported from Hungary and Poland. The country produces plenty of hops, and madder is cultivated with such success, as to form one of their most considerable exports: there is also great plenty of a yellow dye, and likewise plantations of tobacco; but the saffron of this country is not very good.

In the mountains, and in Upper Silesia, pitch, tar, and resin are made from the pine, fir, and beech, and the larch tree yields turpentine. From these resinous trees, the inhabitants among the mountains make a kind of lamp-black.

Their breeding of horned cattle extends no farther than is just necessary for the plough, and a sufficiency of milk, butter, and cheese; and their oxen are still fewer in number, on which account the markets are principally supplied from Hungary and Poland. The most famous of these ox markets are those of Brieg, Breslau, and Schweidnitz, where formerly at the annual fair, it was not uncommon to see ten, twelve, or fifteen thousand head of Hungarian and Polish cattle, and sometimes more. There are here bred many fine stout horses; but not enough to supply the country, great numbers being bought at Francfort fair, and brought likewise from Lithuania. The inhabitants of the hilly country keep goats, and estimate the profit of two good ones to be equal to that of a cow; a great deal of cheese being made of their milk. The breeding of sheep is also very profitable, on account of the excellency of their wool. These sheep are sheared twice a year; but the summer wool is reckoned preferable to that of winter, though somewhat lighter. As to venison and game, some parts enjoy a tolerable plenty, while in others they are scarce.

The wild beasts of this country that are only valued for their skins are lynxes, which frequent none but the mountainous parts, foxes, weazels, otters, and beavers, but in no great number.

G. Rollos Sculp.

The breeding of bees in this country is not so considerable as to answer the consumption of honey and wax, on which account great quantities of both are imported from Poland; but their culture of silk is in a fair way of being carried to its utmost extent.

With respect to fish, in the Oder are caught sturgeon and salmon, the former of which are sometimes of prodigious size, skate, lampreys, &c. The other rivers, and especially the lakes and ponds, abound with various kinds of fish, as pike, carp, trout, mullets, &c.

As to the rivers of Silesia, the Oder has its source in Moravia; but is not of any considerable size till it reaches Silesia, which it traverses nearly from end to end, and at Ratibor it becomes navigable. Its banks are generally low and sandy; so that it frequently overflows them to the great detriment of the adjacent country. Into it run all the lesser streams, as the Oster, the Else, the Neiss, the Ohlau, the Stober, &c. The Vistula and Elbe have their source in this duchy, the former issuing from three springs situated among the lofty mountains in the principality of Teschen, on the frontiers of Poland. The source of the Elbe, though generally placed in Bohemia, lies in the Giant's mountain, in the principality of Jauer.

S E C T. II.

The Number, Language, and Religion of the People. Their Learning, Manufactures, and Commerce.

THE number of people in Silesia exceeds a million and a half; these are chiefly composed of Germans, Poles, and Moravians. With respect to the language, German is spoken by most of the inhabitants, though in Upper Silesia, and beyond the Oder, the Slavonic is very common, and in some places bears a nearer affinity to the Polish, and in others to the Moravian.

The inhabitants are of different religious sects. His majesty king Frederic II. at the peace of Berlin in 1742, promised that the popish religion should be tolerated, though without detriment to the freedom of conscience of the protestant inhabitants, or to his own prerogative as sovereign. This promise has accordingly taken place, and all parties enjoy a perfect liberty of conscience. The greatest number of papists are in the diocese of Breslau. This diocese is divided into four archdeaconries, namely, those of Breslau, Glogau, Oppelen, and Lignitz, which, exclusive of the cathedral of Breslau, comprehend under them seven collegiate churches, with seventy-seven archpresbyteries, sixteen priories, five hundred seventy-six parishes, and eighty-six convents; that is, sixty-eight of monks, and eighteen of nuns; but several of these are exempt from the bishop's jurisdiction. All ecclesiastical benefices here, not excepting the see of Breslau, are in the king of Prussia's gift.

The reformation in Silesia began to be introduced by the principality of Lignitz, in 1522, under the auspices of Frederic II. duke of that principality, and soon extended from thence into the principality of Brieg. The city of Breslau, which had before sequestered some lands belonging to monasteries towards charitable uses, likewise embraced Lutheranism; and its example was followed by the city of Schweidnitz, and several other places, till by degrees the reformation became propagated all over Silesia.

In 1609, the emperor Rodolphus II. granted to the princes, states, and vassals who had embraced Lutheranism, both in Upper and Lower Silesia, the free exercise of their religion; confirmed them in the possession of their churches, schools, and consistories, and permitted them to build others: but, on that emperor's decease, violent measures were used to bring back the Lutherans to popery. The treaty of Prague in 1635, seemed to promise them quiet and safety; but these blessings were of short duration; however, it was stipulated by the peace of Westphalia in 1648, that the princes of Silesia, professing the Augsburg confession, should continue possessed of their former privileges, and the free exercise of their religion, in the same manner as before

the war. His imperial majesty by that peace permitted the counts, barons, gentlemen, and vassals of Upper Silesia professing the Augsburg confession, to perform divine worship in the neighbouring places, and the protestants of Schweidnitz, Jauer, and Glogau, were allowed to build three churches. The Lutherans, however, not only lost the above-mentioned duchies, and the city of Breslau, with their churches, excepting only the three they had been allowed to build; but their oppressions were soon renewed, and too many were prevailed on by persecution to embrace popery. This fell heaviest on the Lutherans in Upper Silesia, who had many German miles to go to the nearest Lutheran church, and in some places above eighty English miles. However, by the protection of Charles XII. the religious state of the Lutherans in Silesia was much amended; for that monarch, in a convention concluded between him and the emperor Joseph, in 1707, obtained for them, besides other religious liberties, licence to build six new churches, and the restitution of one hundred and eighteen more, which had been taken from them; by which means they became possessed of three hundred twenty-five churches, to which one was afterwards added under the emperor Charles VI. These benefits were conferred by an act of state at Breslau in 1709; but they cost the Lutherans four millions eighty-seven thousand florins, partly as a loan to the emperor, and partly as a free gift. At length, under the government of the king of Prussia, they were granted a perfect liberty of conscience, with permission to build new churches under the title of houses of prayer, which have increased to the number of two hundred and thirty. But when the benefices are in the hands of the popish clergy, the Lutherans pay surplice fees to the incumbents, though the ministerial functions are performed by ministers of their own sect. On the other hand, in Lignitz, the papists pay the parish dues to the Lutheran ministers, as the established incumbents.

The Calvinists had also formerly the free exercise of their religion, and were possessed of churches in different parts of the country; but the papists gradually ejected them. After the convention in 1707, in which no express mention was made of them, they petitioned for the restitution of their churches; but though they did not want mediators, this proved ineffectual. Frederic II. has, however, granted them the privilege of public worship at Breslau, and many other places.

The Hussites have also some congregations in Silesia, and some of these being Lutherans, and others Calvinists, each sect has its distinct pastor. The Hernhuthers, or Moravian brethren, obtained a grant in 1742, from king Frederic II. to settle in Silesia, with entire freedom of conscience, and public worship. Their ministers in spiritual and ecclesiastical affairs acknowledge no consistory, as being under the king's immediate protection, and in religious matters subject only to their bishop. At Breslau is likewise a Greek church, and the Jews are permitted their synagogues.

Silesia has ever been famous for producing men of learning, of whom some have eminently distinguished themselves. At present all kinds of learning are greatly encouraged, especially among the Lutherans.

The principal manufactures in Silesia are of flax, thread, twine, linen and damask. The printing of linen in water and oil colours, is in some places carried to great perfection; besides which, canvas and buckrams of several kinds are made of thread and worsted. The plain striped and flowered veils, with a mixture of red Turkish thread, are made in this country of such fineness, as to sell for four florins and upwards a German ell. Lace is also made here of tolerable fineness, and more paper is made in Silesia than can be used by the inhabitants. Strong woollen cloths are made in many places. Here are likewise manufactures of linsley woollen serge, druggets, plain and figured fustians, plush, callimancoes, and all other stuffs; as also cottons, gingham, stockings and hats. The dressing of leather is likewise well understood. There are many glass-houses, and in no country is glass more exquisitely polished and cut. In Silesia are also a great number of powder-mills, iron-mills, and manufactures of that metal.

The principal exports of this dutchy are thread, yarn, linen, veils, wool, woollen cloths and stuffs, paper, madder, and mill-stones. The Silesian merchants likewise deal largely in wax, honey, hides, leather, and furs, which are for the most part brought from Poland, Hungary, and Russia.

On the other hand, they import horses, oxen, Polish wheat, and rock-salt, with wines, chiefly from Hungary, Austria, the countries about the Rhine, and France; spices, drugs, several manufactures, and other commodities are also imported. Since Silesia has fallen under the dominion of Prussia, several excellent regulations have been made, by which commerce has been considerably improved.

SECT. III.

A concise View of the Manner in which the greatest Part of Silesia became subject to the King of Prussia. Its Arms and Government.

WITH respect to the history of Silesia, it seems only necessary to observe here, that the death of the emperor Charles VI. in 1740, produced great changes in that dutchy; Frederic II. king of Prussia, laying claim to the following districts: first, to the principality of Jagerndorf, which in 1524 was purchased with the approbation of Lewis king of Bohemia and Hungary by George margrave of Brandenburg, from the house of Schellenberg, and bequeathed by him to his son George Frederic, from whom, by agreement, it devolved to Joachim Frederic, elector of Brandenburg, who left it to his son John George, whom the emperor Ferdinand II. put under the ban of the empire, in 1623, by which he lost the principality of Jagerndorf, which the emperor conferred on the prince of Lichtenstein. Indeed the elector Frederic William, in 1686, renounced his claim to it, in consideration of his enjoying the circle of Schwibus; but this, in 1695, his son Frederic restored to the house of Austria, in lieu of the sum of two hundred and fifty thousand florins: but king Frederic II. maintained by several arguments, that these cessions were invalid. Secondly, to the principalities of Lignitz, Brieg, and Wolau, by virtue of a compact of inheritance entered into, in 1537, between Frederic, duke of Lignitz and Brieg, and Joachim II. elector of Brandenburg, by which the former was empowered to seize it by virtue of the privileges granted the kings of Bohemia in several distant periods, notwithstanding the emperor Ferdinand I. in 1546, had declared such compact of inheritance void.

These principalities had therefore been unjustly withheld from the electoral house of Brandenburg, ever since the failure of the dukes of Lignitz. The above claims were so effectually supported by the march of an army into Silesia, that Maria Theresa, queen of Hungary and Bohemia, for ever ceded to the king of Prussia and his heirs and successors, the countries of Upper and Lower Silesia, together with the district of Katscher, formerly belonging to Moravia, as also the county of Glatz, reserving however to herself some parts of Upper Silesia. On the other hand, the king of Prussia for himself and successors renounced all demands on the queen of Hungary, and took on himself the discharge of the Silesian debt due to the subjects of Great Britain, Holland, and the states of Brabant. The same year the limits between Prussian and Austrian Silesia were settled and distinguished by fixing up a hundred and thirty-eight pillars, with plates of lead affixed to them.

This peace was, however, interrupted by a new war, which broke out in 1744; but was terminated by the treaty of Dresden on the twenty-fifth of December, 1745, wherein those of Breslau and Berlin, with the convention of 1742, were renewed and ratified. The year 1756 produced the third Silesian war, in which the king of Prussia, assisted by Great Britain, opposed the whole power of the house of Austria, assisted by France and Russia; and, after giving amazing proofs of his courage and conduct in defeating the numerous armies

of his powerful enemies, brought them to conclude a peace in 1763.

The king of Prussia styles himself sovereign and supreme duke of Silesia; and by the treaty of Berlin the queen of Hungary and Bohemia has also retained to herself and heirs the title of sovereign dutchess of Silesia.

The arms of this dutchy are or, an eagle crowned, sable, with a crescent argent on its breast, the ends of which are sometimes in the form of an acorn, and sometimes resemble little crosses.

Silesia was never immediately connected with the government of the empire; for it never was an imperial fief, nor obtained a seat or vote in the diet; and as it has never been subject to the supreme tribunals of the empire, the imperial laws are there of no force. While Silesia was annexed to the crown of Bohemia, the commissioners of the sovereign used to lay before the diets of the princes and states demands of pecuniary supplies, which were taken into consideration, and the resolution of the diet made known to the commissioners, and to all the principalities and towns, by their respective deputies: upon which meetings were held in each principality to deliberate on the means of raising the quota each separate principality was to pay towards the sum agreed to at the general diet; and this, one year with another, amounted to at least two millions twenty thousand florins. The collectors of the princes and states remitted the proportions paid by each principality to the general subsidy-office at Breslau, which was dependent on those princes, and paid the money so received to the sovereign's treasury or war-office, or to the treasurer of the household.

This method of taxation, together with the subsidy-office, and the diets, were, however, abrogated by king Frederic II. and two war and domain treasuries are erected at Breslau and Glogau, for the management of the several branches of the public revenue. The excise is on the same footing with that in the more ancient dominions of Prussia, and is limited to the walled towns; but the contributions of the open towns, villages, and seats, are fixed, and continue at the same height both in peace and war. Every principality, and every circle into which it is divided, receives notice of its annual and monthly contingents payable to the contribution. The two war and domain-offices, each of which has its president, directors, counsellors, and other officers, superintend the contributions; cause them to be duly received and accounted for by the office of the receiver-general, and in the particular receivers offices of the principalities; take care that such regularity be observed, as that the contributory and subsidial assessments may be laid and revised in the same precise manner; and that the several sums notified for collection, and duly paid every month into the offices of the provincial receivers, be from thence remitted to the receiver-general's offices at Breslau and Glogau.

Lower Silesia annually pays one million one hundred eighty-one thousand and forty-four rixdollars, according to fixed and invariable regulations; but we have no exact account of the amount of the contributions in Upper Silesia. It is, however, generally supposed, that all Prussian Silesia, in conjunction with the county of Glatz, the produce of the domains, regalia, excise, contributions, salt-works, the duty on stamped paper, which is much easier now than formerly, and the rights of the sovereignty all included, bring in annually above four millions of rixdollars. As to that part of Silesia which belongs to the house of Austria, it was in 1743 obliged to raise a hundred and eighty-six thousand rixdollars.

With respect to the laws and courts of justice, it is proper to observe, that the king of Prussia, in his part of Silesia, has erected three supreme courts, which are those of Breslau, Glogau, and Brieg, each of which has a particular district. They take cognizance of all civil and criminal causes, hear appeals from the inferior courts, and from the judgments of the magistrates of particular towns.

The principal rules of proceeding in these courts, are contained in the *Codex Fredericianus*, the royal ordinances and rescripts, and Brachvogel's Collection of the imperial pragmatic sanctions; besides which there are certain particular

particular constitutions in every principality and lordship, and even in every town.

The princes, states, and the city of Breslau, have their own regencies and courts, both in civil and penal causes, from which an appeal lies to the above supreme courts. The deputies of the princes and states assemble twice a year at Breslau, and, together with the supreme court of that city, decide all contests that have arisen among the princes and states concerning a principality, state, or any tract of land belonging to them; but a party who thinks himself aggrieved may apply to the king in person. The princes when sued on account of the rights and properties of others, or in disputes between themselves and their vassals, must stand trial before the supreme court. As to the inferior lordships, and other country corporations, with the upper and lower courts, they are held without any molestation, except that in capital or penal cases, they require the royal confirmation.

The Lutheran churches and schools are under the inspection of the upper-consistories at Breslau, Glogau, and Brieg, with right of appeal to the tribunal at Berlin. The members of these consistories are the presidents and counsellors of the above supreme court, with an ecclesiastic to each; but the principality of Oels and the city of Breslau have their own distinct consistories: but church affairs among the papists are cognizable by the bishop's court at Breslau; from whence also appeals lie to the tribunal of Berlin.

Silesia is divided into Upper and Lower; and, according to Mr. Busching, contains, exclusive of the county of Glatz, a hundred and sixty-nine cities, and four hundred and seventy-six villages. We shall begin with Lower Silesia, the greatest part of which is subject to the king of Prussia, and contains thirteen principalities.

S E C T. IV.

Of the principality of Breslau, with a particular Description of its Capital.

THE principality of Breslau, or Breslaw, exclusive of the circle of Namslau, which, though belonging to it, lies separate, is bounded on the north by the principalities of Oels and Wolau, on the westward by those of Lignitz and Schweidnitz, on the southward by the principalities of Schweidnitz and Brieg, and on the eastward by Brieg and Oels.

This principality is every where flat and level, and the parts near the Oder and other rivers either sandy or swampy. It is, however, an excellent corn country, and not destitute of rich pastures, the Namslau circle alone excepted; but this abounds in timber and wood for fuel, which are so scarce in the other circles, that the country people use straw, with the stalks of thistles and burdock, as also those of sun-flowers and potatoes, and in many places willows are planted merely for burning.

In most parts they have good cattle and sheep, and particularly cows of a very extraordinary size. The neighbourhood of Breslau produces great quantities of madder, and the rivers are well supplied with fish. The roads, however, are very bad, and, where the soil is black, are scarce passable in wet weather, and for want of timber and quarries of stone cannot be repaired without great difficulty and expence. The city of Breslau, in order to facilitate its intercourse with other places, has caused ditches to be dug along the sides of the roads, and the roads themselves to be paved with stones; a work of several years labour. Some of these ditches are not less than a mile in length, and the keeping them in repair is an annual charge of some thousands of dollars.

The principality of Breslau is divided into four circles; of these the circle of Breslau contains nine cities and two market-towns; and if the villages are not very large the deficiency is made up by the great number of them, they being every where placed within cannon-shot of each other.

The city of Breslau, or Breslaw, the capital of this circle, and of the whole dutchy of Silesia, is situated on the Oder, which on the north side runs close by the walls, and in that part receives the Ohlau, after its

winding course through Old Breslau. The present old city was formerly encompassed by this last river, as with a moat, all without the Ohlau to the walls of the city being additions made by the emperor Charles IV. The several parts comprehended under the name of Breslau are collectively of great extent; for, including the suburbs, the whole circumference is not less than nine English miles. The fortifications of the city are of no great importance. It has several large and regular squares; the main streets are broad, and, besides many noble edifices, it contains a number of very elegant houses and other private buildings. The part called the Dominsel, though lying without the circuit of the town, is defended by low walls strengthened with bastions, and in it stands the cathedral of St. John, which in 1759, together with the deanery, was destroyed by fire. In the same part is also the bishop's library, which forms a particular building; the abbey of the Holy Cross; three or four small churches; the bishop's palace, which is a very spacious structure; the dwellings of the prebends, some of which have very beautiful gardens; and the electoral hospital for poor children of both sexes.

In the suburb called the Sandinsel, which lies before the Sand gate, is St. Mary's church, a very beautiful building; a splendid convent, with a large library, belonging to the regular Augustin canons; St. James's church, which belongs to an Augustin nunnery; and St. Ann's, belonging to the canons of St. Mary. Near the Sand gate is the monastery of St. Vincent, and adjoining to it the magnificent nunnery of St. Clare. Near these fine structures is the beautiful abbey of St. Matthias, with a parish church, and a valuable collection of books belonging to the prebends of the Red Star; and in the same street is St. Agnes's church and an Ursuline nunnery. The Jesuits college, with its splendid church, stands on the site of the castle, which was once the residence of the dukes of Breslau; but the emperor Leopold gave it to the Jesuits.

The other popish churches and convents in the city are, the Franciscan, dedicated to St. Anthony, to which is also annexed a regular built church; St. Hedwiga's, which belongs to a Capuchin convent that stands behind it; St. Dorothy's, which is in the possession of the Minorites; the parochial church of the Holy Corps, belonging to the Johannites commandery, which faces it; the parochial church of St. Adelbert; the beautiful chapel of St. Cesslaus; St. Joseph's, which belongs to another Dominican convent; with the nunnery of St. Catharine. To these are to be added, the mansion-house of the sisters of St. Elizabeth; St. Nickel's church before St. Nickel's gate; St. Maurice's without the Ohlau gate; the small hospital church of St. Lazarus; with the church and convent of the Good Men.

The churches belonging to the Lutherans are St. Elizabeth's, which is the principal, and St. Mary Magdalen's, both in the Old Town, and containing valuable libraries; St. Bernardine's in the New Town has also a good collection of books; St. Barbara's church is appointed to the use of the garrison. There are also three hospital churches, and that of St. Christopher's. The Lutheran service is likewise performed in a large hall belonging to the house of correction. Without the town the Lutherans are possessed of the church of St. Salvator, which serves for the soldiery who are quartered without the city, and another church dedicated to the eleven thousand virgins, without the Oder gate.

The Calvinists assemble in a building on the other side the Oder, which was once the general tax-office. The Greek Christians, most of whom are Armenians, have a church here, and the Jews their synagogues.

The popish university, which is under the care of the Jesuits, is a noble structure. The Lutherans at St. Elizabeth's, and St. Mary Magdalen's, have two flourishing academies, each under the direction of eleven professors, with a grammar-school at St. Bernardine's in the New Town. The exchange is a very elegant structure.

The city, besides a governor, and several courts of justice, has a court of exchequer, a war and domain-office, with those for salt, customs, excise, and trade; a college of physicians, a mint, &c. Frederic II. granted Breslau the third place in rank among his capital cities,

that is, to be next to Berlin and Königsberg. The magistracy and consistory are both composed of Lutherans. This city is at present the center of all the trade in Silesia, and its inhabitants carry on several manufactures. It became subject to the Prussian government in 1741, and in 1757 a small Prussian army, commanded by Augustus William duke of Brunswick Bevern, fortified themselves in this neighbourhood; and, being attacked on the twenty-second of November by a considerable body of the Austrian forces, made a most vigorous defence till the evening; but in the night quitted their camp, and crossing the Oder, the city surrendered to the Austrians. However, on the twentieth of December it was retaken by the king of Prussia, and the Austrian garrison, which amounted to near one thousand eight hundred men, made prisoners of war. In the last siege several of its churches were damaged, and St. Mary Magdalen's library demolished by the falling of a bomb. The greatest part likewise of the suburbs suffered extremely, and that part without the Sand gate was entirely burnt down.

S E C T. V.

Of the Principalities of Brieg, Schweidnitz, and Jauer; with the principal Places contained in each.

WE now come to the principality of Brieg, which is on all sides surrounded by those of Oels, Breslau, Schweidnitz, Münsterberg, Neiß, and Oppeln, except a detached piece which borders on Poland. This is one of the largest principalities in all Silesia, and also one of the most fertile in grain.

This principality is divided into six circles, which contain nine cities and two market towns. The principal place in this principality is,

Brieg, in Latin Brega, the capital of a circle of the same name, and of the whole principality, stands on the river Oder, and is not only well fortified, but is one of the largest, handsomest, and most considerable cities in all Silesia. It has four suburbs, and a very long, lofty, and strong wooden bridge. The castle, which was anciently the residence of the dukes of Brieg, was burnt down during the siege of the city in 1741. On the south side of Brieg stands the abbey of St. Hedwiga, which is in the possession of the papists; besides which here is also a Jesuits college and a Franciscan convent. To the Lutherans belong the parochial church of St. Nicholas, and they have also an academy founded by duke George II. with the church of the Holy Trinity, in which the Polish congregation assemble. In 1643 this city held out a siege against the Swedes, but in 1741 the Prussians made themselves masters of it in four days.

The principality of Schweidnitz borders to the east on the principalities of Brieg and Breslau, to the northward on those of Lignitz and Jauer, to the westward also on Jauer, and to the southward on Bohemia and the county of Münsterberg. It is one of the largest and most populous principalities in all Silesia, and, in conjunction with the principality of Jauer, is supposed to form one-eighth of the duchy.

In this principality are several very high mountains: it, however, affords a sufficiency of grain, timber, and fruit; and abounds in game of all kinds; as also in cattle and pit-coal. Besides these advantages, it has excellent flax and wool; and the inhabitants are remarkable for their industrious improvement of these advantages, by carrying on a variety of manufactures. This is chiefly done in the hilly parts of the principality, where its greatest trade is carried on. It has no large rivers, the principal of them being the Werstitz, Polsnitz, and Bober.

This principality is under the war and domain treasuries at Breslau, and is divided into five circles, the principal towns in which are,

Schweidnitz, the capital of the circle of the same name, and of the whole principality, is a strong fortress situated on the little river Weistritz, in one of the most delightful spots in all Silesia. Its strength formerly consisted in a triple wall; but in 1748, Frederic II. caused it to be fortified with regular works of very great

strength. The parish church is in the hands of the Jesuits, who got footing in this town in 1629, and are likewise possessed of a college and seminary adjoining to it. There are here a Dominican, Minorite and Capuchin monastery, with an Ursuline nunnery, all of which have their respective churches. St. Michael's church without the lower gate is a commendam of the Red Star prebends of St. Matthias at Breslau. Without the town is a Lutheran church, the head minister of which is inspector of the churches within the circles of Schweidnitz, Reichenbach, and Strigan, and the principality of Münsterberg. The greatest part of this city was burnt down in the year 1716; but has been since rebuilt with much more beauty than before, and all entirely of stone; in particular the new town-house is a most elegant structure. However, in 1757, it was taken by the Austrians, after a siege of sixteen days, during which it was in a great measure destroyed by the bombs, bullets, and fires occasioned by them; and in 1758, the Prussians recovered it, after a siege of the same continuance.

Reichenbach, the capital of a circle of the same name, is situated on the little river Peil. In this town is a commandery of the order of St. John, to which belongs the patronage of its parochial church, which is popish; and there is here also a Lutheran oratory. Without the Frankenstein gate is a priory dedicated to St. Barbara, and without the Schweidnitz gate, an hospital that has a small church. In 1632, this city was pillaged by the Saxons; in 1638 by the imperialists, and in 1634, it suffered still greater calamities from the Croats. In 1642, it was sacked by the Swedes, and in 1643, its imperial garrison demolished upwards of one hundred and forty houses for fuel. In this town are some considerable manufactures of fustian, linen, and canvas.

The principality of Jauer is bounded on the east by the principalities of Lignitz and Schweidnitz; to the southward, by Bohemia; to the westward by Bohemia and Upper Lusatia; and to the northward by the principalities of Glogau and Sagan.

The whole principality is in general mountainous, and is separated from Bohemia to the south and west, by a chain of mountains. The Schnee, or Riesenkoppe, is the highest of all the Riesen or Giant's chain, as well as of all Silesia. It raises its head far above any of the neighbouring mountains, and for the greatest part of the year is covered with snow. Those who have climbed it, compute its ascent from the foot to the highest summit, at three German miles, and the reverend Mr. Schilling, late rector of Hirschberg, is said to have discovered, by means of mathematical instruments, that its perpendicular height is no less than twenty-two thousand five hundred Rheinland feet; but this account is certainly a mistake; for was it of such a height, it would be perpetually covered with snow, and the cold would be much more intense than it really is. Its loftiest part is a steep stony rock of considerable circumference, upon which is built a chapel, wherein mass is celebrated five times a year.

This principality does not produce corn sufficient for the great number of its inhabitants; but its mountains contain various ores, with numerous mines of copper and iron; they are likewise covered with wood. This principality yields also pit coal and mill-stone.

The principal river which traverses the whole length of the principality from south to north, is the Bober. There are also several little rivers, particularly the Jauersche water, which passes by the town of Jauer, with a gentle current; but is sometimes so swelled by the snows and rain, as to do considerable damage.

This principality has twelve towns, besides some villages in Silesia, they being four miles in length, and contain many artificers, particularly weavers. The whole principality is divided into four circles. The principal towns, in which are the following.

Jauer, the capital of the circle of the same name, as well as of the principality, lies on the Jauersche water. The houses in the market-place have a range of piazzas along the front, to shelter passengers from the rain; but these are so ill contrived, as to disguise the buildings, and render the fore part of the ground-floor

of little use. The parish church is popish, besides which here is another small church belonging to the same religion, with a Franciscan convent, that has likewise a church, and without the Goldberg gate, the Calvinists have a church and a grammar school. In 1640, this town was taken by the Imperialists sword in hand, and plundered.

Hirschberg, the capital of the circle of the same name, is situated on the Bober, which here receives a small river called the Zaken. This is one of the handsomest, most populous, and opulent towns in all Silesia; it having large and well built suburbs, in which are beautiful gardens and bleaching grounds, where every year many thousand pieces of linen, veils, and other works of the loom are whitened. The papists have here a parochial church, to which belongs an arch-priest, who is inspector over six arch-presbyteries, and a residence of Jesuits. Without the town the Lutherans have a large and handsome church, and a school, for the grant of both which they paid thirty thousand ducats as a gift to the emperor, and also advanced him a loan of one hundred thousand florins. This is next to Breslau, the principal place of trade in all Silesia, it having a very extensive commerce for its linens and veils.

The last place we shall mention in this principality is that of Schmiedeberg, or Smith's-hill, an open free mine town of considerable trade, seated among hills, that owes its origin to the vast quantity of iron ore found in its neighbourhood. Among the inhabitants are many lock and gun-smiths, with other artificers in iron. Here is also a damask manufacture, which makes linen damask, with half and whole silk damasks. The town likewise deals largely in linen. The parochial church is in the possession of the Romans, and there is also one belonging to the Lutherans. Formerly few of the inhabitants were free from wens, which was imputed to the vitriolic and ferruginous quality of the water in the mine trenches; as since the disuse of that water for drinking and dressing of victuals, they are become much less frequent.

S E C T. VI.

Of the Principalities of Lignitz, Wolau, Glogau, Neiss, Sagan, Trachenberg, and Carolath.

THE principality of Lignitz is bounded by that of Jauer to the westward, by the two principalities of Jauer and Schweidnitz to the south; by those of Breslau and Wolau to the east, and by the principalities of Wolau and Glogau to the westward.

The only considerable mountains in this principality are the Spitzberge and Gratzberge. The Oder waters it for about nine miles, running along the borders of the principality of Wolau, where it is joined by the Cratzbach, the largest river in all the country; but is subject to inundations. This principality is very fertile, and contains some large woods. There is here a good breed of strong horses, and the country about the villages near the city of Lignitz produces madder.

This principality is divided into four circles, and contains five towns, the principal of which are,

Lignitz, the capital of a circle of the same name, and of the whole principality, is seated on the Catzbach, in the fifty-first degree twenty-one minutes north latitude, and the sixteenth degree twenty minutes east longitude. It is walled round, and near the gate of Glogau is the old palace of the princes, which, though within the town, is encompassed with a distinct moat and high wall. Here the states of the provinces assemble in a very stately stone edifice. The Lutherans have two churches here, one called St. Peter's and St. Paul's, or the Upper church, is situated in the Lower Town near Breslau gate. The papists are still in possession of the collegiate church of St. John, which in 1698, was taken from the Lutherans, and being given to the Jesuits, was entirely rebuilt: they have also a magnificent college. Besides these, there is a Benedictine nunnery of the Holy Cross, with its church; the parochial church of St. Nepomuck, and a Franciscan church and con-

vent. Here is also an hospital, and a spacious academy founded by the emperor Joseph, for the instruction of young gentlemen of both religions, in military exercises: Lignitz is one of the most ancient towns in all Silesia, and carries on a good trade in cloths and madder. It has very frequently been destroyed by fire, and in 1741, the Prussians took it without opposition.

Goldberg, the principal town in a circle of the same name, is situated in a delightful country near the river Catzbach, and is, next to Lignitz, the best town in the principality. It is supposed to have been founded in the twelfth century, and is seated on a hill, which within the town is not every where level. The parish church here belongs to the Lutherans. In the sixteenth century it had a celebrated academy kept in a building which had been formerly a Franciscan convent, and in 1704, it was restored to that order; so that the Lutherans have only a common grammar school. There is here also a commandery of the order of St. John. The Catzbach is a great convenience to the town, yet its overflowing its banks has frequently done it considerable damage. This town has also sometimes suffered greatly by fire.

Luben, the capital of a circle of the same name, is situated in a plain, which though somewhat stony, is not unfruitful. The town is small; but its suburbs are large. Of the ancient palace of the princes, little more is now to be seen than the walls. Near this palace is a small popish chapel. The parish church and school are in the possession of the Lutherans.

The principality of Wolau is bounded on the south by the principalities of Breslau and Lignitz; on the westward, by those of Lignitz and Glogau; on the northward, it is also bounded by the latter, and on the eastward by Poland, and the principalities of Trachenberg, Oels, and Breslau.

The soil of this duchy is for the most part either dry, marshy, or over-run with woods and bushes; but there are several tracts which yield good corn.

The Oder traverses the whole principality from south to north, and on the borders of Lignitz, is joined by the Catzbach, where it likewise receives the little rivers of Caltenbach, Juferitz, and several other streams which water this principality.

This district contains six circles, and the same number of towns, the principal of which is,

Wolau, the capital of a circle of the same name, and of the whole principality. It is on all sides surrounded with marshes, which in wet weather form a natural defence. It has two suburbs, named Breslau and Steinau; and in it is a palace, with a Popish church, and a Carmelite convent; but the town church and school are in the possession of the Lutherans. In the year 1640, it was taken by the Swedes, and in 1642, surprised by the Imperialists; but soon retaken by the Swedes, and in 1644, was recovered by the Imperialists.

The principality of Glogau is surrounded by Poland, and the principalities of Wolau, Lignitz, Jauer, Sagan, and Crossen. It produces a great deal of corn and wine, has a sufficiency of wood, and its wool is wrought into different manufactories; it likewise abounds in iron. The Oder waters most of the circles in this principality.

It is divided into six circles, in which are sixteen boroughs and four market-towns.

Great Glogau is the capital of a circle, and of the whole principality, and is called Great to distinguish it from Glogau in Upper Silesia. It has a handsome castle, is well fortified on the side of Poland, and has a governor and commandant, who are nominated by the king of Prussia; it is the seat of several courts of justice, and also of the war and domain office, the excise office, the military treasury, the subsidy office, and the domain office. It is situated on the Oder, fifty miles to the east of Breslau, and in it is a palace, a popish parish church, a college of Jesuits, a monastery of Dominicans, another of Franciscans, and a nunnery of Clarists, with a Lutheran church and school. It has been frequently almost consumed by fire, and has often been besieged and taken; but in 1741, the Prussians having carried it by assault, strengthened its fortifications.

The

The principality of Neifs, by some improperly called the principality of Grotkau, is environed by those of Munsterberg, Brieg, Oppeln, and Jagerndorf, as also by Moravia and the county of Glatz. The southern part of this principality is very mountainous; as through it runs the Moravian mountains; but the northern part is both more level and more fertile. Within the circles of Neifs and Grotkau are bred good horses, the latter also yields tobacco, and in the former is made a great number of iron mills. Its largest river is the Neifs, which runs out of the principality of Munsterberg, and after continuing its course for some miles from west to east, winds away northwards. Most of the brooks and rivulets of this country discharge themselves into it. In this district also rises the Ohlau; the source of the Oppa is likewise among the mountains of this country.

The whole principality of Neifs contains under it eleven cities, and as it is within the bishopric of Breslau, that bishop usually styles himself prince of Neifs, and duke of Grotkau; and, by virtue of this principality, takes place of all the other princes in Silesia. As part of this principality is subject to the king of Bohemia, the bishop is under two sovereigns.

Neifs, in Latin Nissa, the capital of the circle of the same name, and of the whole principality, is a place of great strength, situated on the river Neifs, on the other side of which is a hill where king Frederic II. at the siege of this city in 1741, raised his first battery; and in 1743 a Prussian fort was erected by order of that prince, who laid the first stone. The king appoints a governor and commandant; but the bishop is possessed of the palace, and has a treasury, a court of justice, a domain and constitutional-office. Here is also a collegiate church, which is likewise the parochial church, dedicated to St. James and St. Nicholas; the abbey of St. Peter and St. Paul, dedicated to the Holy Cross; a Jesuits college, two Franciscan convents, a Dominican monastery in the new suburb called Frederickstadt, a Capuchin convent, and a nunnery of the order of *St. Maria Magdalena de paenitentia*.

The principality of Oels is surrounded by Poland and the principalities of Brieg, Breslau, Wolau, and Trachenberg: its soil is sandy, and not very fertile; and it contains eight cities and one town. It is divided into four circles, the principal place in which is,

Oels, in Latin Olsena, the capital of the same name and of the whole principality, is situated in a marshy soil on the river Oels. It contains a palace of the prince, with two Lutheran parochial churches, a free-school, endowed with salaries for a master of languages, a fencing and writing-master, and a popish church. In 1634 it was burnt by the Imperialists, and in 1730 the greatest part of it was again demolished by fire.

The principal city of Sagan is bounded on the east by that of Glogau, on the south and west by Lusatia and the duchy of Crossen, and to the northward by that duchy. It contains large woods and chaces; and, as it abounds in iron ore, has a great number of iron mills. The Queisz runs through the whole length of the principality, traversing it from south to north, and in its course receives the Bober, the Tscherna, and the Briesnitz. It is divided into three circles, and contains three cities and one market-town.

Sagan, the capital of a circle, and of the whole principality, is seated on the Bober in a pleasant country, and has a palace of the dukes, with an abbey and a church of regular Augustins; a Jesuits college, and a Lutheran church and school, for which the Lutherans made the emperor a donation of ten thousand florins, and lent him fifty thousand. It has been several times destroyed by fire.

The principality of Munsterberg is environed by the principalities of Schweidnitz, Brieg, Neifs, and the county of Glatz. It has a good soil, and, besides flax, hemp, and wood, produces hops and all sorts of grain. Here are likewise a large breed of horned cattle and sheep. To the west and south it is very mountainous, the Bohemian chain ending and the Moravian chain beginning there.

In this principality are three boroughs and one market-town; and it is divided into two circles, the principal

town of which is that of Munsterberg, the capital of the whole principality, which is seated on the river Ohlau, and has an old castle of the dukes, with a parochial popish church, and another called St. Peter and St. Paul's belonging as a commendam to the Red Star prebendaries of St. Matthias at Breslau. To these are added, a Lutheran oratory, with another of Bohemian Calvinists. The most considerable employment of the inhabitants is the culture of hops.

The principality of Trachenberg, or Drachenberg, is bounded on the west by the principality of Wolau, to the southward by that of Oels, to the eastward by the free seignior of Militsch and Sulau, and on the northward by Poland. Its soil, though somewhat sandy, produces plenty of all kinds of grain; besides which the inhabitants breed good cattle, and the country abounds in timber.

The most considerable place in this district is Trachenberg, the capital of the principality, which is situated on the Bartsch, and has a palace of the prince surrounded by a branch of that river, with a popish church, and a Lutheran oratory.

The principality of Corolath is on every side surrounded by three circles in the principality of Glogau, and contains two or three towns and a few villages; but as they have nothing worthy of notice, we shall not trouble our readers with any description of them.

There are also in Lower Silesia several lordships; but as most of them are very small, and none of them contain any thing worthy of notice, we shall not trouble our readers with a repetition of their names.

SECT. VII.

Of Upper Silesia, containing the Principalities of Oppeln, Ratibor, the Circle of Leobschutz, and the Principality of Teschen.

THE principality of Oppeln, in Upper Silesia, which we shall now describe, is bounded on the west by the principalities of Neifs and Brieg; to the northward on the principalities of Breslau, Oels, Brieg, and Poland; to the eastward on Poland and the lordship of Beuthen; and to the southward on the principalities of Ratibor, Jagerndorf, and Troppau, with part of Moravia; and is the largest of all the principalities in Silesia.

The soil is in many places sandy, and it has also several large heaths and forests; but the country is not quite so bad as it is represented. The people find their account in tillage, the culture of wood, and the breeding of sheep; but fish and game are very scarce in the cities, which is probably owing to the great quantities of the former consumed in the popish days of abstinence, and the latter is engrossed by the lords of the country.

The Oder, which comes from the principality of Ratibor, runs through a considerable part of this country, where it receives many smaller streams. There are also several lakes.

This principality consists of twelve circles, in which the greatest part of the inhabitants are Poles.

The principal place in this principality is Oppeln, the capital, which is seated on the Oder, over which it has a bridge. The old palace, which was separated from the town by a branch of the Oder, was destroyed by fire in 1737. In this town is a bishop's court, a collegiate abbey dedicated to the Holy Cross, a college of Jesuits, and a Dominican and Franciscan convent. This town has suffered greatly by fire, and in 1741 was taken by the Prussians.

The principality of Ratibor terminates to the northward on the principality of Oppeln; to the westward on those of Troppau and Jagerndorf; to the southward on the lordships of Oderberg, Loszlau, and Plesz, which also forms its eastern boundary. Its soil is better than that in the principality of Oppeln, it producing a sufficient quantity of wheat, rye, barley, and fruit; besides which it has good pasture grounds. The Oder is the only river in the whole country: but it is watered in all parts with brooks, ponds, and lakes.

It contains only three cities, and the inhabitants are universally Polish.

Ratibor, the capital of the principality, is seated on the Oder, which here becomes navigable, and has a bridge over it. The palace, with the church of St. John, stands on the opposite side of the river. Here is also a parish church, a canonry of the Holy Cross, a convent of nuns who are called the Sisters of the Holy Ghost, a Dominican and a Franciscan convent. It has been several times destroyed by fire, and in 1745 the Prussians took it by storm from the Hungarians, who lost a great number of men.

Adjoining to the last mentioned principality is the circle of Leobschutz, which contains the principality of Jagerndorf and that of Troppau, which intersect each other. The principality of Jagerndorf, in Latin Principatus Carnoviensis, has a fertile soil, and many mineral springs. The larch-trees, which are very common in this country, yield a great deal of turpentine. In this principality are five towns. The principality of Troppau, in Latin Principatus Oppaviensis, is both a good corn and pasture country; it abounds in fruit, and contains ten small cities, with one town.

The capital of the principality of Jagerndorf has the same name, and is a small town situated on the river Oppa, but defended by a castle and other fortifications. The city of Troppau, or Troppaw, is also small, but is an antient town, with a fortress built after the antient manner. It stands on a pleasant plain, has plenty of all necessaries, and is noted for its good beer; but has no great trade. It is well built, and surrounded with a strong wall, with the river Oppa on one side, and the Mohre on the other. Besides its beautiful parish church, which is richly adorned on the inside, there are three cloisters, and three commanderies of Malta. The town-house is a large structure, and the houses in general are of free-stone and pretty lofty.

The principality of Teschen joins to the principality of Troppau, and is for the most part hilly, though on the north it is marshy and has several lakes; but it has many fertile spots, and abounds in wood. The Vistula has its source in this country, and the Olsa, or Elsa, also rises in the Carpathian mountains, which begin here; and, after traversing the greatest part of the principality, falls into the Oder.

In the whole principality are five towns, part of the inhabitants of which speak German, and the other Polish. The mountains are inhabited by Walachians, and the people of this country are famous for making excellent fire-arms.

Teschen, the capital of this principality, is seated in a very fertile country on the river Elsa. It is walled, and contains a large church, with two monasteries and a college of Jesuits. In the suburbs is a Lutheran church, in which divine service is performed both in the German and Polish languages. To this church is also annexed a school.

Besides these principalities in Upper Silesia, there is also that of Bilitz, and a considerable number of free lordships, which contain nothing worthy of notice; we shall therefore proceed to the county of Glatz.

S E C T. VIII.

Of the County of GLATZ.

Its Situation, the Face of the Country, and Produce. Of the Inhabitants, their Religion, and Places most worthy of Notice.

THE county of Glatz is seated between Bohemia, Silesia, and Moravia, being on all sides environed by mountains, which render it of very difficult access; the entrance to it being a long, rugged, rocky, and troublesome road.

This county is thirty-eight miles in length, and about twenty-three miles in breadth. It is every where mountainous, and most delightfully variegated with hills and dales, meadows and woods, fields and streams, interspersed with towns and villages. In a good year it

produces more wheat than is sufficient for home consumption, and in bad seasons is supplied at a moderate rate from the adjacent countries. What fruits and culinary herbs it wants are imported from Silesia, Bohemia, and Moravia. It also yields rich pastures, and graziers turn to good account. It has great plenty of wood, as well as game of all kinds; and its fish, particularly its trout, are very large and well tasted. Here are likewise quarries of mill-stones, and stone fit for building, which are exported to other countries; and it affords good marble, with jasper, topazes, and cornelians. In this county are also coal pits and a copper mine; but the silver mine works of Wilhelmsthal, or Neustadt, and Merzberg, are at present discontinued.

This county has also mineral springs and warm baths. Here rises the river Neiss, which, after watering this country, passes into the principality of Munsterberg, in Silesia; and at the distance of about two miles from its source, rises the Morel, on the borders of Moravia, and is the chief river in that duchy. Here likewise issues the Erlitz, which divides this county from Bohemia.

There are in the whole county nine towns, with upwards of one hundred villages that are generally large and populous. The usual language spoken here is the German. The inhabitants live mostly by tillage, grazing, spinning thread, and the linen trade.

In the sixteenth century the opinions of John Hufs prevailed considerably; and, from the year 1560 to 1623, Lutheranism maintained its ground against the most violent opposition; but, after the last mentioned year, all the Lutheran pastors and school-masters, to the number of above a hundred and twenty, were driven out of the country, and the rest of the Lutheran inhabitants, by compulsion and blandishments, were prevailed on to embrace popery, though numbers preferred exile to apostasy. Thus popery became the public religion of the whole country; but since its being ceded to the king of Prussia, the Lutherans are again permitted the free exercise of their religion.

This county makes but one circle, and is divided into six districts; in which the places most worthy of notice are,

Glatz, called by the Bohemians Kladzko, by the Poles Klodzko, and in Latin Glacium, is the capital of the county, and is situated on the declivity of a hill by the river Neiss, in the fiftieth degree thirty-six minutes north latitude, and the sixteenth degree twenty-one minutes east longitude. Most of the houses command a fine and extensive prospect of the country, and on the top of the hill is built the old castle, which was formerly divided into three parts, called the Lower, Middle, and Upper palace. The buildings of the first lie lower towards the city; in it is a spacious area, surrounded with buildings, and in them are vaults secured from fire, in which things of value and consequence may be safely lodged, and water is conveyed through pipes from the water tower near the Lower mills, quite up into this Lower palace. In it is also a popish church. From this Lower palace you ascend to the Upper, which stands much higher on the top of the rock, and has three courts, with a very deep well hewn quite through the rock, that yields plenty of excellent water.

Since Glatz has belonged to Prussia, the old citadel has been greatly improved and strengthened, particularly by the addition of very commodious barracks, capable of quartering a numerous garrison; and as it stands within sight of the whole county, at the firing of a gun, or the lighting up of a beacon, the approach of an enemy may be made known to every part in a quarter of an hour's time.

The new citadel, which is a Prussian work, stands directly fronting the old one, with the river Neiss running between them, and by means of speaking trumpets advices may be mutually communicated. This new citadel is very advantageously situated, and is a strong and regular building, that is also provided with a good well, which at a great expence is cut through the rock. Between these two citadels is also a sluice, by which the intermediate country may be laid under water.

The town itself is now strongly fortified, and in beauty, cleanliness, and order, has been greatly improved under the Prussian government. It has several suburbs, and has a parish church, with a college and seminary belonging to the Jesuits. A new church was built here in 1742, for the use of the garrison and other Lutherans. In the horse-market without the town, is a Minorite convent with a church, a Franciscan church and convent, and an alms-house in which is a chapel. Here are likewise two large mills belonging to the king, with magazines of corn and meal.

Glatz enjoys a good trade, but has been frequently pillaged and burnt; but its severest siege was that in 1622, when it held out against the united forces of the emperor Ferdinand II. and his allies. In 1742, the Prussians took it by capitulation.

In the district of Landec, is a little open town of the same name, situated on the Biela, the inhabitants of which live chiefly by tillage, graziery, and the sale of their beer and brandy. It has suffered greatly by war, and has been frequently sacked and burnt; but it is most remarkable for the warm baths that lie near it. The village of Upper Thalheim joins the town, and from thence a long wooden bridge leads to a small elegant

seat and an eminence planted with lime trees, on which is a church, and from thence to the New Bath. On proceeding two or three hundred paces to the left, you arrive at St. George's Bath, which stands somewhat higher than the other, and issues from a hard rocky soil, on an eminence east of the Biela, and about a hundred paces from a wood; the water there gushes through the fissures of the rock, which were formerly seventy in number; and in several of these fissures, the stream is equal in thickness to a man's arm. Nothing can be more pellucid than this water, though it is impregnated with a strong sulphureous smell, and its degree of warmth somewhat exceeds that of milk as it comes from the cow. The largest spring, which is in the middle, is nearly boiling hot; but others are only tepid, and others again quite cold; so that the water collected from all these several springs, must naturally be no more than luke-warm. The New, or, as it is called, our Lady's Bath, which has been already mentioned, is tepid, clear, and in taste and smell perfectly like the capital spring. On a hill about two thousand paces distant, is what is called the White Well, the water of which, besides, its being transparent, has a most grateful taste, and is extremely cold, though it is never known to freeze.

CH A P. XII.

Of S A X O N Y.

S E C T. I.

Of Saxony in general, and particularly of Upper Saxony; its Limits, Extent, Produce, and Rivers.

THE limits of Saxony are differently described. It formerly extended over both the circles of Upper and Lower Saxony; but for some time the name has been confined to the electoral dominions of Saxony. In the extensive sense, as including the circles of Upper and Lower Saxony, it is bounded on the north by the Baltic Sea, Denmark, and the German Ocean; on the east by Poland and Silesia; on the south by Bohemia, Franconia, and Hesse-Cassel; and on the west by Westphalia, extending between the fiftieth and fifty-fifth degree north latitude, and between the eighth and eighteenth degree east longitude from London.

The circle of Upper Saxony, which lies to the east, includes in it not only the dutchy of Saxony, but the principality of Anhalt, the landgravate of Thuringia, the margravate of Misnia, Lusatia, the marquise and electorate of Brandenburg, and the dutchy of Pomerania, which are divided into many lesser districts.

The twenty-two states which compose this circle, taken in their proper order, are the elector of Saxony, the elector of Brandenburg, Saxe-Weimar, Saxe-Eisenach, Saxe-Coburg, Saxe-Gotha, Saxe-Altenburg, Saxe-Querfurt, the Hither and Farther Pomerania, Camin, Anhalt, Quedlinburg, Gernrodo, Walkenried, and Schwartzburg-Sondershausen, Schwartzburg-Rupoldstadt, Mansfeld, Stolberg, Barby, the counts of Reuffen, and the counts of Schonberg.

In this circle the elector of Saxony has always been the sole summoning prince and director; but ever since the electoral house of Saxony embraced the Romish religion, in order to qualify the princes of that house to wear the crown of Poland, it appeared dangerous to the electoral house of Brandenburg, that the direction of this circle, which is of the protestant religion, should remain on the former footing.

Saxony, in general, is one of the most fertile countries in all Germany; it in many places yields a rich increase of all kinds of grain and fruit; the inhabitants likewise cultivate hops, flax, hemp, tobacco, anise, wild-saffron, and woad. The minerals of this country are

of great importance, and the searching after, working, and exportation of them, employ a very great number of people. The porcelain earth near Aue is excellent. The terra figillata and fullers earth found in several places are extremely good. There is also a variety of fine coloured earth; besides which, Saxony yields various sorts of beautiful marble and good free-stone, serpentine stone, crystals, topazes, hyacinths, rubies, garnets, amethysts, sapphires, and opals; different species of agates, chalcedonies, cornelians, and jasper. Vitriol and allum are likewise prepared here, and Saxony also yields an earth of great use in the preparation of borax. Near Grosrich has been dug a transparent and opaque amber of different colours. Coal is dug here, and Saxony prepares a very beautiful sulphur: it also produces cinnabar and quicksilver, with antimony, bismuth, and arsenic. The mines of silver are extremely valuable, as are those of copper, tin, lead, and iron.

In many parts of Saxony is a good breed of horses, horned cattle, and sheep. Wild boars and venison are also extremely plentiful; but these must be hunted by none but the great.

The Elbe is the principal river of this country, and greatly promotes its trade. This river flows out of Bohemia, and, having traversed the whole circle of Misnia and a part of the electoral circle, enters the principality of Anhalt, and at last runs into the dutchy of Magdeburg.

The Black Elster, which flows out of Lusatia, passes through the circle of Misnia and the electoral circles, and discharges itself into the Elbe.

The Mulde, divides itself into two branches; but these uniting in the circle of Leipzig, falls in one stream into the Elbe, in the principality of Anhalt.

The Saale, rising in the principality of Culmbach, passes through a part of the dutchy of Magdeburg and the principality of Anhalt, and falls into the Elbe.

The other rivers are the Unstrut, which rises in the Eichsfeld, the White Elster, and the Pleisse.

These rivers, as well as the lakes and rivulets, yield a variety of fish; and in the White Elster are found pearl muscles that have beautiful pearls, some of them as large as a cherry-stone.

British Miles 69 to a Degree.
German Miles 15 to a Degree.

S E C T. II.

Of the Electorate of Saxony: the Disposition, Manners, and Religion of the People; with a concise Account of their Learning, Arts, and Manufactures.

THE Saxons, says the Baron de Polnitz, have capacities equal to any nation in the world, and are naturally magnanimous and averse to slavery. The men are well made, robust, agile, laborious, good soldiers, and artful courtiers: they are addicted to pleasure, more especially to gaming and the bottle: they love pomp and expence, are ceremonious, and affect, more than any other Germans, to imitate the French, especially in their fondness for new fashions and new acquaintance.

The women are extremely fair, and some of them have the finest faces in the world. They are generally well shaped, tall and slender, dance well, have a most genteel air, which they set off by a rich dress, and are extremely fond of ornaments; but seem somewhat affected, and talk with too much action. They are good-natured, gay and lively, passionately fond of dancing and merriment; and when they love, says our author, it is with all the heroic sentiments and constancy of a Cleopatra or a Clelia. Though they are fond of gallantry, they are averse to idleness; and, as they are very ingenious, amuse themselves with all sorts of work belonging to the needle, the shuttle, and the distaff.

According to the marquis d'Argens, the Saxons appear to be the most polite and most ingenious of all the Germans; at least they have the most happy way of expressing themselves; and all the Germans agree, that their language is spoke in Saxony with the greatest purity. The universities of this country abound with illustrious scholars, whose merit is allowed throughout Europe, and almost every town in Saxony is famous for politeness and the cultivation of the arts and sciences. Cranach, the famous Saxon painter, says our author, was not inferior to the great masters of Italy; and Handel, the prince of musicians, was born at Dresden. In short, the numerous and well-regulated institutions for the promoting of learning in the different parts of Saxony, facilitate the task of education, and promote the reception of the sciences.

The people have, however, been much oppressed, both by the ravages of foreign troops, and the oppressions of the late princes who filled the throne of Poland. Hence Mr. Hanway, on his passing through this electorate before the late war, observes, that the richness of the soil did not seem to diminish the poverty of the inhabitants. Hunting, says he, is the favourite diversion of the Saxon court; but by this diversion the industrious inhabitants are more distressed than the brutes. Above thirty thousand head of deer, says he, are said to range in the open lands and forests; and though they break into the corn-fields of the farmer, he dare not kill one, under the penalty of being condemned to the galleys. These, with the wild boars, are so great a nuisance, that the Saxons would gladly compound to support a body of eight thousand soldiers extraordinary, on condition of having these animals reduced to half their present number. In every town of any note fifty of the inhabitants keep watch, five every night, by rotation, with bells to frighten the deer, and defend their corn from these devouring enemies.

Among the other calamities, under which this country labours, the jealousy arising from religion, says Mr. Hanway, is none of the least. The established Lutheran clergy oppress the Calvinists, who are obliged to have not only their marriages and burials, but even their christenings performed by Lutherans; while both think themselves highly injured by the countenance given at court to the Roman catholics, imagining it a gross absurdity for a Protestant people to be governed by a Romish prince: for, according to the established constitution of Saxony, the Roman catholics can no more have a church in Dresden than their elector, without being of the Romish church, can be king of Poland. A chapel, however, is connived at, by which is understood a pri-

vate, or at least a plain and modest place of worship; but what is called the Romish chapel at Dresden, is a pompous structure, so richly adorned with statues and architecture, that art and expence seem to contend for the superiority.

The peasants of this country carry provisions a great distance to market in wheel-barrows, which are well adapted for that purpose both in height and other dimensions. The wheel is bound with iron, and is both larger and lighter than those used in England.

The useful and fine manufactures are very numerous in the electorate. Great quantities of yarn are spun, thread bleached, coarse and fine linen wove, together with ticking; and there are a variety of cotton, woollen, and silk manufactures; tapestries are wove, fine lace, edgings, ribbons, and paper are made. The porcelain of Meissen is famous throughout all Europe. Fine glasses and mirrors are made here, and out of the serpent-stone they form a variety of things. Iron is wrought into black and white plates in the greatest quantity; steel and brass are also made and worked here. Saxony has likewise its manufactures of gold and silver. A fine blue colour is made of cobalt with a mixture of arsenic. A great trade is carried on in wood and timber at Grimma, from whence a vast quantity of boards, chests, boxes, &c. are exported down the Elbe to Hamburg.

Salt is the only necessary commodity wanting in Saxony, and with this it is chiefly supplied from Halle, a city belonging to the king of Prussia. Possibly this inconvenience might be removed, if proper care was taken of the salt-springs, of which there are several that, under the management of skilful persons, would doubtless yield a sufficient quantity, both as good and as cheap as that imported from Halle.

S E C T. III.

The Titles and Arms of the Elector of Saxony; the Taxes laid on the People; and the Divisions of that Electorate.

THE court of Saxony has always been distinguished by its splendor, in which it seems little inferior to any court in Europe; but the reader will form a better idea of the pomp and grandeur of this prince, when we come to treat of his palaces, the curiosities deposited in them, and their splendid furniture. We shall here therefore content ourselves with giving the titles and arms of that prince, and the taxes raised for the support of the government.

The elector of Saxony styles himself duke of Saxony, Juliers, Cleve, and Berg, as also of Engern and Westphalia; arch-marshal and elector of the holy Roman empire; landgrave in Thuringia; margrave of Misnia, and likewise of Upper and Lower Lusatia; burgrave of Magdeburg; princely count of Kenneberg; count of the Mark, Ravensberg, Barby, and Hanau; and lord of Ravenstein.

The arms of Saxony are a garland of rue, or according to Zollman, an ornamental filateé for the head and hair, placed obliquely from right to left over eight, or, according to others, over ten fesses sable and or, ranged alternately above each other. On account of Thuringia, a lion marked with four transverse strokes argent and gules, drawn alternately, open jaws, an exerted tongue gules, and gripes projected or, and on the head a crown of the same, in a field azure. On account of Misnia, a lion sable, with an exerted tongue gules, gripes projected of the same, and a double inverted tail in a field or. On account of Juliers, a lion armed sable and argent, with a tongue exerted gules in a field or. On account of Cleves, in a field gules, an escutcheon argent, in the center of which are eight scepters conjoined or. On account of the Berg, a lion gules, crowned azure, in a field argent. On account of Engern and Westphalia, an eagle crowned or, in a field azure, with three hornets horns gules, in a field argent. On account of the palatine of Saxony, an eagle displayed or, and crowned with the same, in a field azure, as also an eagle uncrowned or, in a field sable. On account of Lower Lusatia, an

ox gules and courant, with a belly argent, in a field of the same. On account of Upper Lusatia, part of a wall or, trowelled sable, and built battlement fashion, in a field azure. On account of the mark of Landberg, two erect fesses in a field or. On account of the seigniory of Plesslein, a lion divided or and argent, in a field azure. For the county of Orlamunde, a lion sable crowned gules, and cloathed with rose-leaves of the same, in a field or. On account of the burgravate of Magdeburg, an escutcheon divided longitudinally downwards, in whose fore-field gules appears a semi-argent eagle crowned or, and in the hinder-field argent, four bars gules. For the county of Brene, three semi-circles gules, or the horns horns cantoned argent, in a field of the same. On account of the burgravate of Altenburg, a rose gules with seeds or, and painted vert, in a field argent. For the county of Eisenberg, three fesses azure, in a field argent. For the county of Ravensberg, three chevrons gules, placed above each other, and from below to the top fixed or conjoined to each other, in a field argent. For the county of the Mark, a fesse consisting of three chequers gules and argent, in a field or. On account of the Regalia, an escutcheon modelled or. For the county of Hanau, three chevrons gules, in a field or. For the princely county of Henneberg, a hen placed on a mount verte, and in the position to take wing, in a field or. For the county of Barby, two barbles crowned or, placed back to back, and beset on the sides with four small roses, in a field azure. On account of Munzenberg, a field divided cross-wise, in its upper part or, and in its lower argent. On account of Lichtenberg, a lion sable, in a field argent: and on account of the office of arch-marshal of the holy Roman empire, an escutcheon divided cross-wise, whose upper part is sable, and its under argent, the two electoral swords gules lying cross-wise over each other.

The customary taxes of Saxony are partly ordinary and partly extraordinary. The ordinary taxes are those which are granted every six years by the country: to this head belongs the land-tax; and the taxes upon liquors which arise from the imports upon white and brown beer, that is, two rixdollars for each vessel of the former, and one and a half for each of the latter; but the nobility and possessors of noble estates, and also the ecclesiastics, are, for themselves and families, freed from any imposts upon the liquor they consume at their tables. And also the flesh-penny, or flesh-tax, from which the nobility and clergy are also exempted.

The extraordinary taxes are usually the penny-tax, which rises and falls in proportion to the damage done by fires and storms; the ember-tax, and the excise, which is two-fold. The land-excise amounts to three-pence in the dollar out of the price of certain goods sold. The general consumption excise has been introduced into such towns and villages as are inhabited by handicraft tradesmen. Besides this last there are the poll and estate-taxes, stamped duties levied upon paper, cards, shoes, &c. also on the marriage of a new sovereign; and on other occasions it is customary to make a donation in money.

The mines also bring in a considerable revenue to the sovereign, which is paid in kind, or certain proportions of silver, tin, lead, copper, iron, and several sorts of minerals. Mr. Hanway observes, that the electors revenues amount to near one million five hundred seventy-five thousand pounds sterling; and adds, that the expences of the court are so great, that six thousand five hundred ducats are annually allowed for sweet-meats, &c. which is near twice as much as the king of Prussia allows for his table. Yet Saxony is said to owe forty millions of dollars; but his late majesty was so fond of curiosities, and particularly paintings, that our author was told, he gave half a million of dollars, intended for part of a payment due to the king of Prussia, for the duke of Modena's pictures.

As to the military force of this country, it is sufficient to observe, that there are usually maintained about twenty thousand regular troops, besides well regulated militia.

The whole electorate of Saxony is divided into circles, which according to their order of rank, are the

electoral circle or dutchy of Saxony, the circle of Thuringia, that of Misnia, that of Leipzig, that of Erzeberg, that of Vogtland, and the circle of Neustadt, with the two districts of Merseburg, and Naumburg-zeitz.

SECT. IV.

Of the Electoral Circle, or the Dutchy of Saxony, and the Circle of Thuringia.

THE electoral circle borders on those of Misnia, Leipzig, Thuringia, the principality of Anhalt, the mark of Brandenburg, and on Lusatia. Its greatest length as well as its greatest breadth, is estimated at about forty-seven miles. The country is not remarkable for its fruitfulness, a great part of it being sandy. The Elbe runs through a part of it, and between Gorf-dorf and Elster receives the Black Elster. Some tracts of this country are watered by the Mulde.

This circle contains in it twenty-four towns, three boroughs, four hundred and twenty villages, one hundred sixty-four noblemen's estates, and eleven prefectures, in which the most considerable town is the following.

Wittenberg, in Latin Witteberga, or Leucorea, is a fortified town in the prefecture of the same name, situated near the Elbe, and famous for the manufacture of coarse cloth, the wool of this country being remarkably good. Cloths are sent hither from all parts to be dyed, and the blues and greens, commonly called Saxon, are best dyed here. In this place is an university, in which are about seven hundred students; and here is the Sokoloff church, a building of about three hundred years standing, where Luther first preached the doctrines of the reformation; and in this church that great reformer was also interred, but has no other monument besides a brass plate with an inscription, except his original portrait at length, painted on wood, and well preserved since the year 1540.

The people here have a strong tincture of Romish superstition; among other instances of which the credulous say the devil visited Luther in the library which now belongs to the university, but that the reformer was so unpolite as to throw his ink-stand at him.

This town is not large, but fortified; the old citadel was formerly the electoral residence. In a large round tower, which stands by the university church, are kept the common archives of the electoral family. In the parish church belonging to the town, is held the general superintendency: there is here also a Latin school, which has six teachers. In 1547, this town was taken by the emperor Charles V. In 1640 it suffered greatly by fire, and in 1756 was taken by the Prussians, who broke down a bastion of the fortifications.

We come now to the circle of Thuringia, which forms the north part of the landgravate of that name. The country, which is well watered, yields good pasturage, and abundance of corn, particularly wheat, which is excellent, as also fine woods, and produces woad, saffor, and anise. It has a considerable breed of horses, horned cattle and sheep.

In some parts of the country swarms of field mice commit great ravages among the corn; for they not only devour a great quantity in autumn, but lay up large winter stores in their holes; so that the government, in order to extirpate these noxious animals, gives for every full grown mouse six pfennings, and three for a young one.

The forest of Thuringia, which is pretty extensive, affords no other grain but a few oats, so that the inhabitants are obliged to buy corn from their neighbours; however, they have great plenty of wood, which is sold at a very low rate.

In Thuringia are forty-seven towns, fourteen boroughs, six hundred seventy-four villages, three hundred noble estates, and thirteen prefectures, belonging to the electoral house of Saxony, the principal places of which are the following.

Weissenfels, in Latin Leucopetra, is a well built town, seated on the river Saale. On a white rock
above

above the town is a fine citadel called Augustusburg, which was the ordinary residence of the dukes of Saxe-Weissenfels; as also an arsenal, which was stripped by the Prussians in 1756; a town church, another church near what was formerly called the cloister of St. Clara; an hospital containing a small church; an academy erected out of the above-mentioned nunnery, and, from duke Augustus its founder, named Augusteum; a Latin school, and manufactures of silk and velvet. At the royal hunting house, which lies before Nickels gate, resides the provincial huntsmaster of the circle of Thuringia. In 1757, a considerable number of the troops belonging to this circle had posted themselves in the town; but were driven from thence by the Prussians; when, in order to facilitate their flight, they burnt down the large and spacious wooden bridge built over the Saale.

Langensalza, the capital of all the electoral Saxon Thuringia, is seated in the Salza, in a spot very fruitful in corn, and contains an ancient citadel, about nine hundred houses, two parish churches, one superintendency, whose spiritual jurisdiction is divided into the Upper and Lower circle; a Latin school, and some manufactures of stuffs. It carries on a good trade in corn, half silks, serges, and other commodities.

S E C T. V.

Of the Margravate of Meissen or Misnia, containing a Description of Meissen and Dresden, with the several Palaces, and most remarkable Curiosities, and an Account of the Fort of Konigstein, and its extraordinary Tun.

THE margravate of Misnia, or Meissen, is bounded on the north by the dutchy of Saxony; on the east by Lusatia; on the south by Bohemia; and on the west by Thuringia; and is about a hundred miles in length, and eighty in breadth. It is divided into fourteen prefectures, and contains forty boroughs, four market towns, one thousand three hundred ninety-three villages, and twenty sovereign palaces, the principal places in which are the following.

Meissen, in Latin Misena, is situated on the Elbe, where the rivulets of Triebisch and Meisne pour themselves into it; and from the last it takes its name. It stands partly on eminences, and partly in a valley. The bishopric, which was first founded in the year 948, belongs to the Lutheran church, and the chapter consists of a provost, a dean, a senior, a chanter, and five canons. In the cathedral are the monuments of several bishops, and on the high altar stand the statues of three margraves of Meissen, represented in the character of the Eastern magi bringing gifts to the infant Jesus. Of the old citadel, which stands on a mountain, the fore part, which belonged to the burgraves, and the hind part, which belonged to the bishops, are now become ruinous, and the center only remains, in which is carried on the celebrated manufacture of the excellent Misnian porcelain. This, however, is a large building, capable of some defence. Mr. Hanway tells us, that he had an opportunity of being convinced of the secrecy with which this manufactory is conducted; for there is no admittance into the works without an order from the governor of Dresden; nor are the workmen ever seen without the gates; they being all confined as prisoners, and subject to be arrested if they go without the gates: for this reason a chapel and every thing necessary is provided within. The workmen amount to about seven hundred, most of whom have not above ten German crowns a month, and the highest wages are forty, so that the annual expence is said not to exceed eighty thousand crowns. This manufacture being entirely on the king's account, he sells annually to the value of one hundred and fifty thousand, and sometimes two hundred thousand crowns, or thirty-five thousand pounds.

The churches in and near the town, besides the cathedral already mentioned, and in which is the burying vault of the princes, is a parish church, the cloister, or Franciscan church, the church of St. Afra, near the provincial school, and three burying churches belong-

ing to the head church of St. Afra, which is near the provincial school, and has many others united with it, both in the town and country, and together with the provincial school, is immediately under the upper consistory of Dresden, and the school called the Afraneum, which was formerly the Benedictine cloister of St. Afra; the number of scholars taught and maintained gratis, amount to one hundred and eighteen. There is also a town school. The bridge, which extends over the Elbe, is supported by stone piers; but the upper part is of wood, and it is observed, as a master-piece of art, that the middle arch, which is seventy-five paces wide, is kept together by a single wooden peg. The country in the neighbourhood of this town, produces a good sort of wine.

The country between Meissen and Dresden is extremely beautiful, consisting of a delightful mixture of corn-fields, gardens, meadow-lands, and pasture. The banks of the Elbe are adorned with a great number of vineyards, and the industry of the people have made them form the steepest hills into a number of terrasses covered with vines. Near Meissen the valley grows narrow, and some of the houses scattered along the banks of the Elbe are built on rocks, which rise perpendicular from the river, and form a very agreeable and romantic scene.

Dresden, the metropolis of this electorate, and one of the finest cities in Germany, is agreeably situated on the river Elbe, in the fifty-first degree twelve minutes north latitude, and in the thirteenth degree forty minutes east longitude from London, seventy miles north-west of Prague, and ninety south of Berlin, in the midst of a plain surrounded by lofty hills about two leagues distant, the nearest of which are converted into vineyards. As the city stands on both sides the Elbe, it is united by a stone-bridge six hundred and eighty-five common paces in length, and about seventeen in breadth, containing eighteen arches; but Mr. Hanway observes, that the passage over it being horizontal, takes off from that grand effect which a curve produces in these structures. There are several round projections with seats in them on each side of the bridge, and a fine iron balustrade all along. On the fifth pilaster on the right hand in going from the new city, the arms of Poland and Saxony are neatly cut in stone, supported by two statues representing Poland and Saxony, and on the opposite side is a brazen crucifix of curious workmanship. For the more convenient intercourse between the towns, a new bridge has been built consisting of nineteen arches, and over every pier are four pedestals with a stone urn upon each.

In this city are several squares and lofty stone buildings six or seven stories high, which make an elegant appearance, but are inferior in beauty to those of Berlin; besides, many of the streets are narrow. Near the entrance of the new city is an equestrian statue of king Augustus, erected on a lofty pedestal, and is said to be made by a common smith, and on that account is worthy of being admired, though it has many capital defects, particularly in the horse's head.

The place which affords the greatest entertainment to a curious traveller is what is called the green room, or the museum. This collection was begun by the elector Augustus, and placed in a green room of the royal palace, which name it still retains, though there are now several apartments painted green, and filled with these curiosities. The fee for seeing this museum is generally discharged with five or six guildens, or about fourteen shillings given the attendant who opens the doors; but the greatest part of it goes to the superintendant, or keeper of the museum. At the entrance, the shoes of all who are admitted are carefully wiped, in order to keep the place as free from dirt or dust as possible. All the apartments are floored with marble of different colours, of the produce of Saxony.

In the first apartment is to be seen a great number of small brass models of most of the famous statues and monuments that are extant, both antient and modern. Among these are an equestrian statue of Augustus II. king of Poland, of Frederic William the Great, after the famous statue in Berlin, of Lewis XIV. and the models of the most celebrated statues in Italy.

The second room is filled with curious clocks and clock-work, adorned with gold and silver. Among these is the representation of the Virgin Mary and Joseph, with the infant Jesus in the manger, and the shepherds with the Eastern magi performing their adorations to the Messiah, while the heavens seem to open with a surprising effulgence. Here is also a ship which sails round a table, while some of the sailors in it weigh anchor, and the rest are in continual action; and at the same time it performs a piece of music. The Japan work on the wall of this apartment is an exact imitation of inlaid work of jasper and other precious stones.

In the third room is a numerous collection of drinking-vessels and other curiosities in ivory, particularly a ship with all its sails, masts, and rigging.

In the fourth apartment the eye is dazzled with a multitude of gold and silver utensils, most of which are large goblets and other drinking-vessels. The pannels of this room are of looking-glass.

The fifth is a spacious room, in which are a great variety of precious stones, and curious vessels made of them. Here is a large table of jasper cut in relieve of onyx, chalcedony, and other gems, representing a young prince on horseback, preceded by the Virtues, pointing out to him the way to true glory; while the Vices, with looks full of rage and confusion, are flying from him. This is an antient piece which cost eighty thousand dollars. Here is a statue of Charles II. king of England; a large goblet set round with the most curious and costly antiques; the angel Michael vanquishing the devil admirably performed in wood, and cost in England, where it was made, two thousand five hundred pounds sterling. Here are likewise several figures consisting of gems and pearls naturally adapted to constitute the different parts, and so curiously arranged, that they appear to have been designed by nature for the places they occupy. Among these, what more particularly strikes the eye is the story of the prophet Jonah; the whale, the ship, the prophet, and the sea-shore being made of pearls properly arranged, and the rocks in the sea represented by very large gems. Another curious piece represents two persons carrying in a bason before them a number of small pearls: the bason and pearls are the work of nature, with very little assistance from art. Two other persons are carrying on a pole a large bunch of grapes, imitated to the greatest perfection with oriental emeralds.

The sixth apartment is surrounded with closets, in which are placed the electors of Saxony as big as the life in their proper habits. In the middle of this room is a clock in the form of a woman, which moves the head every minute from one side to the other.

The first object shewn in the seventh apartment is a tea-equipage, with a table, &c. all of gold enamelled, and set with diamonds, and cost forty-six thousand dollars. On a table an ell broad, and an ell and a quarter long, is represented the celebration of the Great Mogul's birth-day. The monarch is exhibited sitting on a throne, the grandees of his empire lie prostrate before him with their respective gifts, and the portico is crowded with his guards, elephants, and every thing belonging to the splendor of an eastern court. Dinglinger, jeweller to the court, and fifteen other ingenious artists under him, were ten years and eight months employed on this piece; for which he was paid eighty-five thousand dollars. The pillar in the middle of the room is adorned with beautiful basso-relievos of Arabian agate, and on it is an oriental onyx of an oval figure near a quarter of a Dresden ell in its longest diameter. In the golden fleece belonging to the order of knighthood is a diamond for which the king of Poland paid two hundred thousand dollars; it weighs a hundred and ninety-four grains and a half, and is placed between two diamonds, each of which is equal in size to a large nutmeg.

In the last apartment are, among other things, a clock of gold set with gems, and a jasper table with veins of crystal and amethysts. This jasper comes from Frieberg, only four miles from Dresden, and it is but a few years since the real value of the Saxon jasper was known, for the peasants formerly used this sort of stone, together with others, to inclose their fields; yet it is very beautiful, but extremely difficult to polish. The number of

curiosities in the above apartments is exceeding great; but some idea may be formed of this collection by the few that have been mentioned, and it is observable that the judicious arrangement of the several pieces adds a surprising beauty to the whole.

The palace is furnished in a most superb manner; the drawing-rooms are particularly worth seeing, on account of twelve pictures by Lewis Silvester, representing the rape of Proserpine, the metamorphosis of Acteon, with other fables from Ovid; and a piece representing the late elector taking leave of his father, at his setting out on his travels. The latter recommends his son to Pallas and Mercury. Behind the prince stands his governor; by his side is Prudence with a telescope in her hand, and several genii hold up maps of the countries which the prince was going to visit. The ceiling of the audience-room was also painted by the same hand. The looking-glasses in some of the apartments are between eight and nine feet high, and six and seven broad. The assembly-room for the royal family is hung with rich tapestry, representing the achievements of Alexander the Great.

Among the surprising quantity of plate kept in the plate-cabinet are four stands, each weighing four hundred and seventy-one marks, and twelve others that weigh nearly as much; two silver vases, each above five feet high, scarce to be fathomed by two men, weighing six hundred marks each; two pieces of the same fashion little inferior in weight; and eight cisterns with the vessels standing in them, each weighing eight hundred marks. The mark is eight ounces.

The common assembly-room is adorned with tapestry representing the battle of Hochstet. In the several apartments are many curious clocks, beautiful tables, rich cabinets, and other furniture; among which a foreigner should not omit seeing the confidants-table, a curious piece of mechanism, on which the elector dines privately with his confidants; for this table, with all its appurtenances, rises from the lower apartments into the upper, without one servant being seen.

There is another museum in the palace which contains a vast variety of curiosities. In the first chamber is a collection of prints, from the commencement of the art of engraving to the present time.

The second is the mineral-gallery, in which is the earth of the different countries in the world, and ores of every denomination.

The third contains petrifications, particularly of wood, animals, &c.

In the fourth chamber, which is a very large one, are different kinds of wood and vegetables; in particular there is a cabinet with three hundred and fifty squares as big as the palm of a large hand, run in flat as drawers, of so many different kinds of wood. In this apartment are also the pictures of a man and his wife, who lived near Tameswar; the man was a hundred and eighty-five years of age, and his wife a hundred and seventy-two.

In the fifth chamber is a small cabinet of skeletons, and other anatomical curiosities. The sixth contains the skins of a variety of animals stuffed. The seventh has the skins of fishes stuffed. The eighth has a great quantity of different kinds of shells. In the ninth is a cabinet of about six feet high, and four broad, every drawer of which has some natural curiosity in amber. In the tenth is a grotto with springs of water. In the eleventh are many curiosities in coral. The twelfth contains the skeletons of lions, bears, &c. of a prodigious size, and the stuffed skins of some extraordinary beasts, particularly of a horse, whose mane is said to be three ells and a half long, and his tail twelve ells and a half.

In another apartment at some distance is a model of Solomon's temple cut in cedar, as described in the Old Testament, with all its furniture.

The gallery of pictures is one of the finest in the world; part of the collection consists of a hundred capital pieces, which are said to be all originals, and to have cost half a million of crowns. Among these are the capital works of Raphael, Corregio, Rubens, and all the great masters. The whole collection consists of above two thousand pieces, and are valued at between two and three million of crowns.

The elector's gardens, though agreeable, are too level, and void of those natural beauties that are capable of being afforded by an equality of ground. A small palace is situated in them, which is approached by a grand avenue of a considerable length. A field for tournaments is in the front, and behind is a fine piece of water. The gardens which are on the sides, are adorned with a profusion of marble statues, many of them larger than the life. These shew the genius of Augustus I. the late king's father, who being entirely devoted to his amours, left them to after-ages, as monuments of his lasciviousness. The orangery, which is in another part of the city, has four hundred orange-trees of a very large size, and many exotics.

The Chinese palace, thus called from the taste of the building and the furniture, is situated on the Elbe, and commands a view of the bridge and the Romish chapel. The ornaments of the architecture, and the relieve of the frontispiece, are in the Chinese taste; but after all, it is far from being an elegant structure. It has fourteen rooms, in which are a great number of leopards, wolves, bears, monkeys, and other animals, as large as the life, made of porcelain, with elephants and rhinoceroses of the size of a great dog, and a prodigious variety of birds and fowl, with a curious collection of flowers, all of porcelain made at Meissen. The apostles near three feet high, are in white porcelain. There is also a representation of the crucifixion four or five feet high, with many other curious pieces; but what is more surprising, there are forty-eight China vases that appear to be of no use, and to be extraordinary only on account of their great size, and yet the elector's father was so charmed with them, that he purchased them of the late king of Prussia at the price of a whole regiment of dragoons.

The Turkish gardens and palace are situated in Plau-street. The first floor of the palace is adorned with many pieces of painting, representing the ceremonies used in the Turkish seraglio, with the baths, audiences, &c. in which all the great officers of state are dressed in their proper habits. In the second story are the pictures of several celebrated beauties that have made no little noise at the court of Dresden, all in Turkish dresses. The tapestry hangings and other furniture of this palace, are either the manufacture of Turkey or Persia, and several tables are set off with oriental curiosities; as knives made in Tartary, a Persian enamelled tea-equipage, and a large bowl of *lapis nephriticus*, which is called the *welcome*; and this bowl full of wine is to be drank off by the ladies on their arrival here; as a large bowl made of a Maldivia nut, is said to have been presented to the gentlemen by the cham of Tartary on such occasions. Here are also shewn silver cymbals, to which the Turkish women generally dance, and several other curiosities of the same kind.

The menagery is in old Dresden, and contains lions, tygers, leopards, lynxes, and several other animals; and at the elector's palace at Neustadt-ostra, near Dresden, there are kept a number of tame stags, which draw in a carriage, and when Mr. Keyser was there, one of them was used for the saddle. These generally set out with great spirit, but soon flag.

The palace of count Bruhl has been built at several times, and the apartments are elegant and richly furnished. They are adorned with lustres of porcelain in beautiful figures; the tables have a variety of tea equipages, and the figures of men and women, birds and beasts of porcelain. The drawing-room is pannelled with looking-glass, and his cabinet furnished with enamels and crayons. The house and gardens belonging to it are situated on the Elbe, near the bridge, and command a pleasant prospect. His library, which is in the garden, is two hundred twenty feet long, and well furnished with books: but what is most striking is the gallery of pictures, which, though it does not contain a fourth part so many as the royal gallery, is incomparably more magnificent. It is one hundred fifty-six ells long, and the paintings are shewn to great advantage, by being ranged only on one side, and fronted by lofty windows, that afford sufficient light to shew the minutest beauties of this excellent collection. The pannels between the

windows are of looking-glass, against which are placed statues and busts that have a grand effect.

The other remarkable buildings at Dresden are the opera-house; the assembly-house, and the royal stables, the outside of which is very grand; the arsenal, which was stripped by the Prussians in 1756, under which is the electoral cellar; the palaces of the electoral prince, and the other princes of that family; the electoral chancery office, the mint office, the foundery, the court dispensary, the royal foundation for Roman catholic boys and girls, the academy for painting, the palace of prince Lubomirski, the hotel de Saxe, and other magnificent palaces and buildings.

The places of religious worship are the church of the Holy Cross, which is the principal; St. Mary's, St. Sophia's, the garrison church, and the Roman catholic chapel, which is a curious piece of architecture. In the suburbs are the churches of St. John, St. Anne, St. James, St. Bartholomew, and the Lazar church.

About the year 1730, the number of houses in Dresden, including the suburbs, were computed to amount only to two thousand five hundred, and that of the inhabitants to little more than forty thousand, including the garrison; but in 1755, there were reckoned here about eighty or ninety thousand men.

In the city and its neighbourhood, many ingenious manufactures are carried on. The trade of Dresden is, however, very inconsiderable; the most important article is the silver brought in ingots every fifteen days from the mines near Friedburg, to the amount of about twenty thousand dollars, or three thousand five hundred pounds sterling. This silver is immediately coined into florins of sixteen grosch, which with respect to the current money of bats, driers, &c. is worth seven per cent advance, and is therefore, says Mr. Hanway, so speedily conveyed into the neighbouring territories to be coined again, that it is next to impossible to obtain, in the ordinary commerce of the people, change in this money for a single Louis d'or.

About four miles from Dresden, on the other side of the Elbe, is the royal palace of Pillnitz, which stands in a pleasant country, and is adorned with a great number of portraits of the most celebrated beauties of Saxony.

Five miles from Dresden is fort Konigstein, which stands on a rock, cut so steep, that it appears quite perpendicular, and in many places has projections in the manner of bastions, from whence the sides of the rock may be raked and defended. The ascent towards it is the least difficult, for which reason it is secured on that part by good works, and a triple row of cannon ranged one above another. Wood and other necessaries are drawn up by the help of cranes. The garrison consists of one hundred and fifty men; but on the first alarm from the governor, the neighbouring villages are obliged to furnish some hundreds more. This fort is always stocked with provisions sufficient to last many years. On the top is a large green area, a wood, and several gardens, in which are thirty-eight different kinds of forest and fruit trees, with pastures and land fit for agriculture. The fortress is provided with fine cisterns, or small ponds, as reservoirs for snow and rain water, in which are several kinds of fish for the governor's use; but the water drank by the garrison, is drawn up by a wheel from a well nine hundred Dresden ells deep.

One of the greatest curiosities to be seen at this fort is the tun which general Kyaw caused to be made here. Its length is seventeen Dresden ells, and its diameter at the bung twelve ells. It consists of one hundred fifty-seven staves, eight inches thick, and fifty-four boards for the heads. It holds three thousand seven hundred and nine hogheads, and upon one head of the cask is a Latin inscription to the following purpose:

"Welcome, traveller, and admire this monument,
 "dedicated to festivity, in order to exhilarate the mind
 "with a chearful glass, in the year 1725, by Frederic
 "Augustus king of Poland, and elector of Saxony,
 "the father of his country, the Titus of his age, the
 "delight of mankind. Therefore drink to the health
 "of the sovereign, the country, the electoral family,
 "and baron Kyaw, governor of Konigstein; and if
 "thou

“thou art able, according to the dignity of this cask, the most capacious of all casks, drink to the prosperity of the whole universe: and so farewell.”

The top of the cask is railed in, and affords room for fifteen or twenty people to regale themselves. There are also several kinds of welcome cups, which are offered to strangers.

This fortress is a place of confinement for state prisoners. It has an arsenal, and in a room called the hero's apartment, besides the old Saxon warriors, which the painter has drawn according to his own fancy, are the portraits of all the generals employed by the elector.

SECT. VI.

Of the Circle of Leipzig, with the District of Wurzen, and the principal places in each.

THE circle of Leipzig, including the district of Wurzen, is bounded by the Misnian and Ertzgebirg circles, by a part of the duchy of Altenburg, the bishoprics of Merseburg and Naumburg-Zeitz, and by the Thuringian and electoral circles. It contains thirty-two towns, nine hundred forty-seven villages, and consists of fourteen prefectures.

The principal city of this circle is Leipzig, which signifies the place of lime-trees, and is one of the finest and most celebrated towns in all Germany. It is situated in a pleasant and fertile plain on the Bleisse, in the fifty-first degree twenty-two minutes latitude, and in the twelfth degree thirty-four minutes east longitude, forty-six miles to the north-west of Dresden. It has several other rivulets in its neighbourhood, as the Barde, the Elster, and the Luppe. It is indeed said to be only eight thousand nine hundred fifty-four paces in circumference; but it has large and well built suburbs, with fine gardens. Between these suburbs and the town is a fine walk of lime-trees, which was laid out in the year 1702, and encompasses the city. Mulberry-trees are also planted in the town ditches; but the fortifications seem rather calculated for the use of the inhabitants to walk on than for defence. The walls have four magnificent stone gates, and the citizens maintain two hundred soldiers. The houses are very lofty, and have elegant fronts. The streets are clean, commodious, and agreeable; they are lighted in the night with seven hundred lamps, and the inhabitants amount to about forty thousand within the walls.

Leipzig has been distinguished during several ages for the liberty of conscience granted to all people. Hence the inhabitants have been industrious in the cultivation of knowledge and moral improvement. Here is an university which is still very considerable, with six churches for the Lutherans, theirs being the established religion, one for the Calvinists, and a chapel in the castle for those of the Romish church. The university library consists of about twelve thousand volumes, six thousand of which are folios. This library is open for the use of the public, from ten to twelve, on Wednesdays and Saturdays; and on the same days, but in the afternoon, free access is allowed to the magistrates library, which consists of about twenty-five thousand volumes, and contains cabinets of urns, antiques, and medals, with many curiosities of art and nature. The exchange is an elegant structure, and the ceiling of the great hall is well painted. The Appel gardens are planted with a great number of yew trees, and adorned with canals, water-works, and statues. In a structure erected in this garden is carried on a manufactory of gold and silver tissue, velvet, &c. The Bosen gardens are very large, but want that symmetry and beauty which appear in the Appel gardens; however, here is a fine orangery, and in a pavilion adorned with some paintings are to be seen a numerous collection of curiosities in the animal and vegetable kingdoms. In an inclosure within the garden are kept some white stags, of a different species from the common deer. The asparagus of Leipzig is large and delicious, the gardens here being reckoned the best in Germany.

All sorts of manufactures are carried on in this city, gold silver, silk, wool, and linen yarn being worked

here into all kinds of stuffs, velvets, stockings, cloths, and linens. There are also houses for the dying of silk, the printing of cottons, the making of tapestry, and the preparation of Prussian blue. The orphan-house is appropriated to the culture of silk. The people here are much famed for their painted cloths in imitation of tapestry.

Leipzig has three fairs, viz. on New-year's-day, Easter, and Michaelmas; but that of Easter is most considerable. To these fairs resort the Poles, Hungarians, Bohemians, Prussians, and indeed people from all parts of Germany; and likewise the English, French, Italians, and even Russians, who all bring the produce of their respective countries, which are bought up there and dispersed, by means of the rivers, to the most distant parts of the empire.

In the years 1631 and 1632 this city was taken by the Imperialists; in 1642 it was taken by the Swedes, and in 1745 and 1756 was garrisoned by the Prussians, to whom it was obliged to pay very considerable sums of money by way of contribution.

The neighbouring country being very pleasant and well cultivated, its fertility draws hither multitudes of larks, which are so very fat, and have so delicate a flavour, that the Leipzig larks are famous all over Germany; and what must appear very extraordinary is, that the excise on these birds produces six hundred thousand dollars, or about nine hundred pounds a year to the city, at a grosch or two-pence sterling for every sixty of those birds. The revenue accruing to the sovereign from the city of Leipzig is computed at four hundred thousand rixdollars, or seventy thousand pounds sterling a year.

The next town we shall mention is Grimma, which has an old ruinous citadel, and is divided into the Upper and Lower town, in each of which is a church with another for interments, and the hospital church of St. George, which lies before the bridge-gate. The prince's, or provincial school, has also a church of its own; besides which there is a town school. The inhabitants procure subsistence chiefly by their wood, cloth, and thread; the dealers in the latter frequent the fairs of Leipzig, their thread being exported far and near. This town was the first in all Saxony that imitated the English flannel.

Rochlitz is seated on the Mulde, in the prefecture of the same name with the town, and contains about four hundred houses. To the west it has a citadel, which stands on a high grey rock. It has three churches, and a good Latin school. In this town cloths, stuffs, and linen are made; and in a mountain near the town are some excellent stone quarries, the red stone in which is exported to a great distance. Marble, jasper, chalcedony, and other beautiful stones are also found here.

The district of Wurzen, though united to the circle of Leipzig, has its own regency, and several towns, the principal of which is Wurzen, which is seated on the river Mulde. The town is but small, but the suburbs, which are much larger, contain in them the old citadel, a cathedral church, that of St. Wenzeslaus, an hospital, and a Latin school. The beer of this town is reckoned equal to any in Saxony, and is exported in great quantities. Here are also many houses for the dying of cloth, several bleaching grounds for linen, and many of the inhabitants get their living by knitting.

SECT. VII.

Of the Circles of Ertzgebirg, Voigtland, Neustadt, Merseburg, and the Bishopric of Naumburg; with their principal Towns.

THE circle of Ertzgebirg is bounded by the circles of Leipzig and Misnia, as also by Bohemia, the Voigtland and Neustadt circles, and has its name from the mountains, which are rich in ore. On the searching and working of this ore and other minerals, and on some manufactures, the inhabitants depend for their subsistence, which they cannot here receive from agriculture. This circle, including the seigniories of the count of Schonburg, contains fifty-four towns, ten mine and market-towns,

towns, and seven hundred and sixty-one villages; and is divided into fifteen prefectures, the principal places in which are,

Freyberg, or Fridberg, the capital of the prefecture of the same name, and the principal mine-town belonging to the elector of Saxony, is seated on the Mulde, into which the river of Lufitz falls, after it has run through the town. Freyberg consists of about two thousand houses, and the number of its inhabitants, in 1725, was computed to amount to sixty thousand. It is surrounded with a double wall, each of which is defended by towers and out-works; but the inner wall has the greatest number. Round it also runs a lined ditch. The tract about the town is pretty mountainous, and yet is esteemed fertile. It has an upper mine-office, which has the direction of all the mines in the country. The citadel lies at a small distance from one of the gates, and is encompassed with a ditch remarkably deep, and has a church of its own. The other churches are the cathedral, near which is the electoral burying-chapel, St. Peter's church, St. Nicholas's, St. James, St. John's, and St. Bartholomew's. Each of the two last has an hospital belonging to it; here is also an academy, which has eight teachers, and in it is kept the public library. Freyberg has also a cannon and bell-foundry, and the inhabitants are employed in making fine Lyons lace and lace of Tombac; and near the town is a sulphur and vitriol-house. Its excellent beer is exported to a great distance. In 1318 it obtained the privilege, that all the carriers that go to Bohemia should be obliged to expose their wares to public sale for three whole days to the inhabitants of this town. The silver mine works in this neighbourhood are of great importance, and the most profitable in all Misnia. There are likewise mines of copper, tin, and lead; all which are said to bring in the elector a clear annual profit of a hundred and thirty thousand pounds sterling. In 1632 it was taken by the emperor, when the elector gave eighty thousand rixdollars to save unruffled the family monuments in St. Peter's church, the German princes being antiently buried in their robes, jewels, &c.

Zoblitz is a small town, where the inhabitants principally subsist by working the serpent-stone, which is found here, into pitchers, mortars, bowls, tea and coffee-cups, writing implements, boxes, pipes, caskets, candle-sticks, snuffers, tobacco-boxes, and also by trading in lace, yarn, and linen. The serpent-stone is dug just above the town; and farther to the east is found a red species, which is esteemed the finest, and is therefore considered by the sovereign as his property; together with a yellow, green, brown, grey, and black sort. In the electoral red quarry are found granates, and also asbestos of various colours.

Zwickau, one of the largest towns in this country, is situated on the river Mulde, and has a citadel separated from the town by a ditch. It has a church in the upper part of the town, another in the lower part, and a third in the lower suburbs. It has a good Latin school, in which is a library that contains above twenty thousand volumes; there is here also a superintendency, whose spiritual jurisdiction is divided into three circles, in which are fifteen boroughs and nine towns, with sixty-six churches in the country. This town has a manufacture of cloth, and a great number of cards are made here for the manufacturers who work in wool, cotton, &c. The trade carried on here consists in these articles, and also in leather, deals, iron, coals, marble, and corn.

The circle of Voigtland is bounded by that of Ertzgebirg, Bohemia, and the principality of Culmbach, and contains fifteen towns and three hundred and twenty-three villages, the principal place in which is,

Plauen, the capital of a prefecture of the same name, and of the electoral Saxon share in Voigtland; it is seated on the river Elster, and contains an old citadel, with one parish church, and another for interments; as also a Latin school and a superintendency, which has a spiritual jurisdiction over ten towns and thirty-nine churches. Here is a manufacture of cotton and cloth.

The circle of Neustadt is bounded by a part of the circle of Ertzgebirg, and the principalities of Altenburg and Saalfeld. It consists of three prefectures, in

which are seven boroughs, two market-towns, and two hundred and twenty-two villages; but the places in this circle are too inconsiderable to deserve notice.

The dutchy of Merseburg is environed by the circles of Leipzig, Thuringia, the county of Mansfeld, and the dutchy of Magdeburg.

The country is fertile, and produces a considerable quantity of corn, millet, and flax. It was formerly a bishopric subject to Magdeburg; but was secularized by the treaty of Passaw in favour of the house of Saxony. One of the dukes, who was administrator of it, having introduced Lutheranism here about the year 1562, it has been since granted as a portion to one of the younger sons, to whom it gives the title of duke, who, with the revenues of other districts added to this noble bishopric, is enabled to keep a very genteel court.

The chapter consists of Lutheran protestants of antient genuine nobility, these are sixteen canons major, among whom are six prelates and four minor canons.

The dutchy has its own regency, together with a peculiar chamber, college, and consistory.

It is divided into five prefectures, in which are one borough, seven towns, and two hundred and twelve villages.

The principal place of this dutchy is Merseburg, where the duke resides. It stands in a fine situation, amidst meadows and gardens, on the banks of the Sala, or Saal, ten miles to the south-east of Halle, and seventeen to the north-west of Leipzig. It is thought to derive its name from Mars, who was worshipped here by the pagan Saxons: within the liberties of the chapter stands the episcopal palace, together with the cathedral, a Gothic structure, in which is to be seen the magnificent tomb of the emperor Rodolphus of Swabia, who died after losing his hand in a battle fought with Henry IV. his competitor, and the burying-vault of the duke of Saxe-Merseburg. Near the cathedral is a library of very antient manuscripts. The town is well built, though not in the modern taste, and its walls and seven towers are of stone. Among the other buildings are the palace, an academy, the chancery, the chapter-house, the abodes of the canons, and the parish-church. It has two suburbs, in each of which is a church, and in one of them is an orphan-house, and a water-engine, by means of which water is conveyed from the Saale into the palace, the town, and suburbs.

The last district we shall mention in the electorate of Saxony is the secularized bishopric of Naumburg, which lies partly on the Saale and partly on the Elster. The former part is entirely surrounded by the circle of Thuringia, and the latter by Thuringia, the circle of Leipzig, and the principality of Altenburg.

The protestant chapter of Naumburg consists of twelve capitulars, six major prebends, and four minor; and the collegiate foundation of Zeitz, which is also protestant, has seven canons. This bishopric has its own regency, together with a peculiar college and consistory; the latter of which is filled up by the counsellors of the regency, in whom is likewise vested the choice of the superintendency of the foundation.

This bishopric contains three prefectures, in which are five towns, and about a hundred and forty villages: but the only places worthy of notice are,

Naumburg, the capital of the district. This city lies in a fertile tract near the Saale. It is under the jurisdiction of its council, and contains a small citadel, with three churches and a school. In the liberty is the cathedral, and the cathedral school. Its yearly fair, which begins on the twenty-ninth of July, enjoys considerable privileges.

Zeitz is a town seated on the Elster, and contains a citadel, which, from its founder duke Moritz, or Maurice, is named Moritzburg. It contains four churches, with a school, and is the seat of the regency and consistory. In this town is likewise a manufacture of cloth.

We here conclude our account of the electorate of Saxony, which composes only one of the twenty-two states into which Upper Saxony is divided, and shall now proceed with the rest.

S E C T. VIII.

Of the Mark or Marquisate of BRANDENBURG.

Its Situation, Produce, Rivers, and Canals. The Religion of the Inhabitants, and their Learning, Arts, and Manufactures.

THE mark of Brandenburg is bounded on the north by Mecklenburg and Pomerania; on the east by Poland; on the south by Silesia, Lusatia, the electorate of Saxony, the principality of Anhalt, and the duchy of Magdeburg; and on the west by the duchies of Magdeburg and Lunenburg.

This country is not every where fertile, some tracts being very sandy; notwithstanding which these lands, when properly cultivated, yield rye, small barley, and oats in abundance, and the corn is thinner shelled than that which grows in a fatter soil. The inhabitants also turn their sandy grounds to advantage by laying it out in vineyards and gardens, or planting it with pine-trees, which thrive well in these parts; but some of the circles are very fruitful, producing wheat, spelt, and large barley in plenty.

This country, under the government of king Frederic William and his son Frederic II. has acquired a very different form from that in which it antiently appeared. Agriculture is universally improved, large tracts of waste land have been cultivated, superfluous woods grubbed up, deep and large morasses rendered dry and fruitful, and a prodigious number of villages erected. In some of the circles millet, buck-wheat, and flax are cultivated; in others great quantities of tobacco, and in others again herbs used for dying. The woods furnish the inhabitants not only with fuel fit for domestic uses, but with great quantities of timber for house and ship-building, a great deal of which is exported to Hamburg, Holland, France, and other places. The woods are also of great advantage for carrying on their glass and iron-works; the making of charcoal, tar, and pot-ashes. Hence great care is taken to preserve those woods in a good condition, for the benefit of posterity.

The inhabitants also employ themselves in breeding of cattle, and particularly sheep, on account of the great advantage they receive from their wool, which enables them to carry on some profitable woollen manufactories; and therefore for the improvement of their breed of sheep, king Frederic II. has caused rams to be imported from Spain and England. The culture of silk is likewise carried on with good success, and is continually increasing; for notwithstanding the climate is in winter much colder than ours, silk-worms thrive, and produce a great deal of silk.

The principal minerals in the Mark are a fine porcelain earth, and all manner of colour-earths, together with allum, salt-petre, amber, and iron stone.

Of the rivers in this country are the Elbe, and the Oder, which may be esteemed the capital rivers of Germany. Besides these there are lesser streams, and many useful canals for the advantage of navigation. One of these canals, named Plauen, shortens the water-passage between Berlin and Magdeburgh about one half; it is eight thousand six hundred fifty-five perches in length, and at the bottom is twenty-two, at the surface of the water twenty-six, and in some places between forty and fifty feet broad, with bridges laid over it, at nine different places. There are also several inland lakes, some of which, in the middle Mark, have a communication by means of canals and sluices. The Elbe and the Oder abound less in fish than the Havel, the Spree, and several smaller streams.

The greatest part of the inhabitants are of the Lutheran church; the preachers belonging to which are ranged under sixty-nine spiritual inspections and their head, partly stiled inspectors, and partly also provosts. The royal and electoral house also now profess themselves of this church. The refugee Bohemians who are settled here are Roman catholics, but the French refugees are Calvinists; however, every inhabitant enjoys an unrestrained liberty of conscience.

The sciences are in high esteem, and greatly cultivated; for their improvement there are Latin schools, several seminaries, the university of Francfort on the Oder, and the academy of sciences at Berlin. The sovereign himself is the patron of learned and ingenious men; and he himself is a philosopher and a poet.

Numerous manufactures are carried on here, the greatest part of which were introduced by the French refugees. The inhabitants make cloths, and several sorts of woollen stuffs, as camblets, calimancoes, flannels, silk stuffs, velvets and tapestries, gold and silver lace, and leather. They prepare all manner of purified earths for colours, allum, salt-petre, gun-powder; and several sorts of wares are made of wrought and cast iron, steel, and brass. They likewise make large and excellent mirrors, and a very fine sort of porcelain. At Berlin are also excellent painters, statuaries, and engravers. Admirable things are also performed in the jewelling, goldsmiths, and enamelling way; fine mathematical instruments are also made; and the Berlin coaches are every where famous. By means of these arts and manufactures, a saving of large sums is made, and the money kept in the country; while the goods exported bring in return a prodigious quantity of gold and silver.

S E C T. IX.

The Royal and Electoral Titles, and Arms; the various Offices by which the Government is administered; the Revenues, and Power of the Elector; and the Number of his Forces.

THE royal and electoral titles run thus: viz. Frederic king of Prussia, margrave of Brandenburg, of the holy Roman empire arch-chamberlain and elector, sovereign and supreme duke of Silesia, sovereign prince of Orange, Neufchatel and Valengin; of the county of Glatz, Guelders, Magdeburg, Cleve, Juliers, the Berg, Stettin, Pomerania, the Cassubi and Wends, Mecklenburg and Crossen, duke; burgrave of Nuremberg, prince of Halberstadt, Minden, Camin, Wenden, Schwerin, Ratzeburg, East-Friesland and Mors; count of Hohenzollern, Rappin, the Mark, Ravensberg, Hohenstein, Tecklenburg, Lingen, Buren, and Leerdam; lord of Ravenstein, the countries of Rostock, Stargard, Lauenburg, Butow, Arlay, and Breda, &c.

The arms on account of Prussia are a crowned eagle sable, with trefoil-stalks or, on the wings, and the letters F. R. on the breast, in a field argent. On account of the mark of Brandenburg an eagle gules, weaponed or, with trefoil-stalks of the same on the wings, in a field argent. On account of the arch-chamberlain's office, a scepter placed palewise in a field azure. On account of the duchy of Geneva, a chess-table divided into five fields or, and four azure. On account of Orange, a belt or, with a blue hunting-horn. On account of Neufchatel, a pale gules beset with three chevrons argent, in a field or. On account of Magdeburg, a shield divided gules and argent. On account of Cleve, eight sceptres or, in a field purple; or according to others, united in a small shield argent, in which is seen a round ring. On account of Juliers, a lion sable in a field or. On account of the Berg, a lion gules crowned azure, in a field argent. On account of Stettin, a griffin gules, crowned or, and weaponed in a field azure. On account of Pomerania, a griffin gules, weaponed or, in a field argent. On account of Cassuben, a griffin sable, turned to the sinister side and weaponed or, in a field of the same. On account of Wenden, a griffin transversely marked gules and verte, in a field argent. On account of Mecklenburg, a buffalo's head sable, having horns argent and crowned gules, with a ring argent passed through the nose. On account of Crossen, in a field or, an eagle sable, with wings, tail and weapons displayed, and having on his breast a crescent argent, over which is seen a small cross of the same. On account of Jagerndorf, an eagle sable with a hunting-horn argent, placed on the breast, in a field of the same. On account of the burgravate of Nuremberg, a lion sable, with open jaws prepared for battle, a tongue exerted gules, weaponed and crowned, in a field or. On

account

account of Halberstadt, a shield divided argent and gules. On account of Minden, two keys argent, placed in form of a St. Andrew's cross, in a field gules. On account of Camin, an anchor cross argent, in a field gules. On account of Schwerin, a shield divided, in whose upper part is a griffin or, in a field azure, the under part vert, with an inclosure argent. On account of Ratzeburg, a cross waving and argent, in a field gules. On account of East Friesland, a crowned harpy or, with wings displayed, in a field sable, and four stars or, in the four corners of the field. On account of Mors, a fesse sable, in a field or. On account of Hohenzollern, a shield quarterly argent and sable. On account of Ruppın, an eagle argent, in a field gules. On account of the Mark, a fesse chequered gules and argent, in a field or. On account of Ravensberg, three chevrons gules and argent, placed over each other. For Hohenstein, a shield chequered gules and argent. For Tecklenburg, three hearts gules, in a field of the same. On account of Lingen, an anchor or, in a field azure. On account of Schwerin, an arm ornamented argent, projecting out of a cloud, and holding in its hand a ring, in a field gules. For Clettenberg, a hart sable, in a field argent. For Regenstein, a hart's attire gules, in a field argent. For Buren, a fesse argent pinnaced alternately on both sides, in a field gules. On account of Leerdam, two fesses gules, alternately pinnaced on each side, in a field argent. On account of the marquise of Ter Veer, a fesse argent in a field sable. For Rostock, a buffalo's head gules and crowned, a tongue exerted gules, and horns argent, in a field or. On account of Stargard, a shield divided gules and or; and on account of Breda, three small St. Andrew's crosses argent.

With respect to the orders of knighthood, we have already given an account of them in treating of Prussia.

With respect to the several offices by which the government is administered, they consist of the following, which are kept at Berlin.

I. The privy state-council, which assembles once a week. In this council all the privy ministers of state and war, as well as those who are in the provinces, have a seat and voice when they come to Berlin. In it are proposed matters of grace, important justiciary affairs are decided, and the vacant investitures conferred, those of the Silesian princes excepted, who are invested by the king himself from the throne.

II. The cabinet ministry, which take care of foreign state affairs, and consist of the privy ministers of state, war, and the cabinet, who are divided into two departments, of which one attends only to German state-affairs, or the concerns of the empire.

III. The general supreme directory of the finances, war, and domains, throughout the whole of the royal and electoral countries; under which are all the war and domain chambers. The king himself is president, and the heads of the six departments into which it is divided have certain privy finance counsellors under them; they are ministers of state and war, and act as vice-presidents, and directing ministers at the general supreme directory of the finances, war, and domains. Under four of these departments are divided the several parts of the king of Prussia's German dominions; the fifth takes cognizance of affairs relating to commerce, arts, and manufactures; and the sixth of the magazines, provisions, marching, quartering, salt-petre, and other affairs relating to the service.

IV. The spiritual department, which takes care of the church, the university, schools, and affairs relating to the poor, and has at its head a minister of state and war.

V. The general post-office, which provides every thing relating to the post throughout the whole of the royal and electoral countries, Silesia excepted.

VI. The supreme court, or tribunal of appeals, the highest justiciary college in all the royal and electoral countries, and to which appeals lie from the several regencies or governments.

VII. The chamber court, which decides all processes throughout the electoral Mark, and consists of two senates, the chief president of which, and likewise of the tribunal, is the great chancellor for the time being.

VIII. The war and domain chamber of the electoral Mark, which has the management of the farming out of the royal prefectures and mills, the care of the finances and domains, and in general of every thing that relates to the royal revenues arising from the electoral Mark of Brandenburg.

IX. The supreme war and domain chamber of accounts, which inspects the accounts of the several cash officers in the royal and electoral countries.

X. The supreme Lutheran consistory, which is employed in filling up the places of preachers and school-masters, and in examining candidates. This consistory is likewise consulted on the filling up of the theological chairs at the royal universities.

XI. The directory of the Calvinist church, which takes cognizance of the concerns of the several Calvinist churches in the royal countries.

XII. The war consistory.

XIII. The pupil college of the electoral Mark, which being appointed for the tutelage of minors, audits their accounts, and provides for the secure lodgment of their capitals.

XIV. The supreme mine-office.

XV. The general provision-office.

XVI. The general salt-chest and salt-factory.

XVII. The supreme medicinal college.

The French have an upper and under judicatory of their own, as also their own revision, tribunal, supreme consistory, and supreme directory, which is styled the *Conseil François*.

The sources of the royal revenues arising from the marquise of Brandenburg are the royal domain, with the forests, posts, mines, mints, duties on salt, stamped paper and cards, excise, imposts upon beer, and grinding, the bushel-tax, tolls, protection-money paid by the Jews, the contribution or tax on hides, land, and houses, &c. These several revenues are collected into different chests, and the sum total of the yearly revenues arising from the mark alone are estimated at about two millions and a half of crowns.

The power of the royal Prussian and electoral house of Brandenburg has risen under king Frederic II. to a height that has attracted the attention and astonishment of all Europe. This power is not so much founded on its extent of territory, which is much less than that belonging to some other European states, but on its excellent internal constitution, as well as on the great insight of its governor into the connection of the different parts of the body politic, and likewise on his own wise and indefatigable attention to the government of his people.

All the countries and states of this royal and electoral house do not exceed three thousand square German miles, and contain in them nearly five hundred towns. From the year 1750 to 1756 there were, one year with another, one hundred and sixty-six thousand five hundred and sixty-seven persons baptized, and about a hundred and twenty-five thousand three hundred and forty-eight deaths; whence, in order to find out the number of inhabitants, we need only to multiply the last of these sums by thirty-eight, which brings the number to four million seven hundred and sixty-three thousand two hundred and twenty-four. The whole of the royal revenues are rated at near twenty millions of dollars. The contributions of the subjects are invariably fixed, and at no time, not even in the most difficult conjunctures of war, are afterwards raised or renewed.

According to a complete list of the royal Prussian army in 1753, it consisted at that time of one hundred and forty-six thousand two hundred and fifty-seven men, which in time of peace requires the sum of ten million nine hundred and thirty-two thousand nine hundred and sixty dollars for their yearly maintenance, exclusive of the charges of mounting and remounting, levying and quartering, which may arise to about one-fourth more: so that the sum total of the money required for their maintenance one year amounts to nearly fourteen millions of dollars.

The discipline of these troops, as well as their expertness at their exercise, is not to be equalled. For their subsistence the several royal and electoral countries are divided

divided into cantons or smaller circles, out of which each regiment, and even each company, has a separate one to itself, out of which its recruits are to be drawn; for which reason the several regiments are always quartered in or near those cantons out of which they draw their recruits. In times of peace these troops have every year nine or ten months furlow granted them, in order to enable them to carry on their business as burghers or peasants.

The above-mentioned army has consisted of ten thousand three hundred and forty cuirassiers, eleven thousand nine hundred and thirty-eight dragoons, ten thousand one hundred and sixteen hussars, and one hundred and thirteen thousand eight hundred and fifty-six foot; among which were four thousand four hundred and twenty-three superior officers, and ten thousand and forty inferior ones. A regiment of cuirassiers consists of five squadrons, a regiment of dragoons of ten, and a regiment of hussars of the like number. A squadron of the two first contains one hundred and sixty-six men, and a squadron of the last one hundred and fourteen complete. A regiment of foot usually consists of two battalions, each of which is composed of six companies, that is one of grenadiers, and five of musketeers. However, two of the Prussian regiments consist of three battalions; these are the regiment of guards and that of Anhalt Dessau. A field battalion consists of eight hundred and sixty-four men, and a garrison battalion of seven hundred and twenty.

The Prussian soldiers are in general remarkable for the shortness of their coats, which seems at first view to proceed from a ridiculous frugality, yet is calculated for very wise ends. Their cloaths sit extremely close to their bodies, and are strengthened at the elbows with leather in the form of a heart, which prevents the necessity of patching an old garment. A Prussian soldier is never seen in rags; but all of them, with respect to neatness and the cleanliness of their persons, appear as gentlemen. The king's guards, and some other regiments, have new cloaths every year, but the rest of the army in general have new regimentals only twice in three years. The last king obliged the soldiers to wear white spatter-dashes both in winter and summer; but his present majesty, observing the inconvenience with which it was attended, gave his men black for the winter. In the same season their breeches are of woollen cloth, but in summer they are of white dimity, or linen, which are very light and clean. They all wear their hair queued, which is by this means easily kept in order; and they are always powdered when on duty. This not only serves to preserve the natural hair or wig, but gives the soldier a respect for his own person, and the rank in which he considers himself in some measure compensates for the smallness of his pay.

The Mark of Brandenburg is in general divided into the Electoral and New Marks. The Electoral Mark comprises in it the Old Mark, the Prignitz, the Middle Mark, and the Ucker Mark. These marks, or provinces, are again divided into circles, and over each is placed a land council. We shall begin with the Middle Mark, on account of its lying next the countries last described, and its containing the capital city, the seat of government.

SECT. X.

Of the Middle Mark of Brandenburg; with a particular Description of the Cities of Berlin, Brandenburg, and Potsdam; the Palace of Sans Souci, and other Places worthy of Notice.

THE Middle Mark is bounded by the Prignitz, the dutchy of Magdeburg, the Saxon Electoral circle, Lower Lusatia, the New Mark, the Ucker Mark, and the dutchy of Mecklenburg. This country has been greatly improved by the last and present king of Prussia, who have caused many marshy and unserviceable tracts to be drained and rendered fertile.

In several parts of this Mark the inhabitants apply themselves to the cultivation of vines; in others millet

and buck-wheat are produced in great quantities; woad, clary, and saw-wort are here cultivated, and in many places it succeeds well in the culture of silk. In some parts are considerable heaths and woods. This district has the advantage of having several fine canals dug for the benefit of commerce.

The Middle Mark is divided into eight circles, the principal places in which are,

Berlin, the capital of all the king of Prussia's dominions, and one of the largest, finest, and most populous cities in all Germany, consisting properly of five towns united under one town-council. In Berlin are several fine palaces, with other magnificent and superb buildings. The streets are for the most part broad, regular, straight, and some of them very long and elegant. There are also several large and beautiful squares, together with pleasant walks. There are twenty-five churches, fourteen of which are Lutheran, eleven Calvinist, and one Roman catholic; an academy of sciences, another of arts and painting, a college of anatomy and surgery, five seminaries, and two public libraries. In 1755 it was computed to contain five thousand eight hundred and twenty-six houses, and one hundred and twenty-six thousand six hundred and sixty-one persons, among which were six thousand five hundred and forty-one French, one thousand two hundred and fifty-three Bohemians, two thousand five hundred and ninety-five Jews, and twenty-six thousand three hundred and twenty-five soldiers who had wives and children.

This city is seated on the Spree, which passes through it in two principal branches, and is in the fifty-second degree twenty-eight minutes north latitude, and the thirteenth degree forty-four minutes east longitude, a hundred and fifty miles to the north-west of Prague, and is encompassed with agreeable gardens and vineyards. The entrance into Berlin is airy and elegant. In going towards the palace, on the new bridge, which is of stone, over the Spree, is an equestrian statue of Frederic William the Great, which is esteemed a piece of exquisite workmanship, and was erected by Frederic I. king of Prussia. Both the man and horse are of one entire piece cast at the same time, and cost forty thousand crowns. The elector is represented in a Roman habit, somewhat above the common size, on a pedestal of white marble, adorned with basso relievo, representing four slaves bound in chains to the corners of the base.

The king's palace is a magnificent structure of free-stone, begun by Frederic I. in 1699, and consists of four stories, with fine ceilings, large apartments, and superb furniture, in particular the quantity of silver every where seen is amazing, for the tables, stands, lustres, chandeliers, looking-glass frames, couches, &c. are said to be all of that metal. Mr. Hanway observes, that the apartments in the palace are adorned with silver in every shape; but these ornaments are so massy, that the fashion does not exceed seven per cent. so that four millions of dollars might with great ease be realized, if the exigencies of the state required it. Here are the pictures of Charles V. and his empress, the frames of which are of silver, each weighing six centners, or six hundred and sixty pounds; and there is a superb crown lustre of seventeen centners. There are also pieces of three, four, and five centners, and a grand music-gallery finely ornamented, all of silver; besides, one end of a large apartment, for about twenty feet high and as many broad, is richly furnished with gilt plate: yet all this is merely for shew, the court having other services of plate for use. This account of the treasures in this palace was written just before the late war, and it is not improbable that might induce his Prussian majesty to melt down some of it into specie.

The king's particular apartments are elegant; but have nothing extraordinary, the prevailing taste is white stucco and gilding. Several of the private apartments have tables, with pens, ink, and loose papers, which indicate the dispatch of business, more than the regularity and elegance one naturally expects to find in a royal palace. The hall has several good paintings, and the grand saloon is adorned with four pieces of tapestry, representing our Saviour driving out the money-changers, his washing the disciples feet, the miraculous draught of fishes, and

and his last supper. The throne in the audience-chamber is of velvet, embroidered with gold in a grand taste; but not loaded with ornaments. There is nothing extraordinary in the old quarter of the palace, except a bed of crimson velvet, which has above two hundred cyphers with electoral crowns, all set with pearls, and the chairs in this room are in the same taste. It is usual for persons of the royal blood to lie in this bed on the first night of their marriage.

The library is far from having a beautiful appearance; but all gentlemen have the liberty of reading there, from ten in the morning till two in the afternoon.

The king's stables are a spacious building, divided into two courts, and nine pavilions, at an equal distance from each other. The architecture on the outside is Gothic; but the inside is more magnificent, and very lofty and lightsome. The mangers are of stone, and the pillars of the stands of iron, adorned with his majesty's cypher gilt. Over the mangers are several large pictures of the finest horses bred in the king's studs. The back side of these stables projects towards the river, a slope being formed instead of a stair-case, by which they descend. Here are noble apartments for the master of the horse and the inferior officers, with large rooms over the stables, in which are deposited a great deal of rich furniture and harness; among which are the accoutrements of the horse on which Frederic I. rode at his public entry; all the ornaments of the bridles, the breast-leather, and crupper, as well as the bits and stirrups, being of gold, adorned with brilliants. These stables are said to have room for four hundred horses.

The arsenal is one of the noblest structures of the kind in Europe, and consists of four grand buildings, that form a spacious square, with four fronts almost exactly alike, and a handsome portico at the entrance of each. The lower story is of rustic architecture, with arched windows. Over the principal gate, which is in the middle, is the model of the king's grand-father in brass gilt, enclosed in an oval frame; the four cardinal virtues, of a gigantic size, are placed on pedestals on each side of the portico, and seem to look towards the picture, and over it is his majesty's cypher, supported by two men, and above it a large pediment covered with a beautiful basso relievo representing Mars, resting on a trophy, and looking at a couple of slaves chained at his feet. The first story is of the Corinthian order, and a balustrade runs round the top, with noble decorations of trophies and statues.

The inside of the arsenal is not less magnificent, the rooms of the upper story being full of arms ranged in great order; the lower rooms are stored with brass guns, and the walls and pillars that support the roof covered with cuirasses and helmets.

Behind the arsenal stands the house of the general of the ordnance, in which is contained the foundery, where a number of men are continually employed. There are several other arsenals in this city, where they keep field pieces, iron cannon, and every thing belonging to the train of artillery.

The opera house is an elegant modern edifice, the front of which is adorned with a noble portico, supported by six Corinthian columns, and in the architrave is wrote FREDRICUS REX APOLLINI ET MUSIS; above which is a pediment adorned with basso relievo and statues. The scenes are splendid, and in an elegant taste. It has three galleries, and is said to contain two thousand persons. The columns that support the roof are calculated to throw the whole into a grand saloon, and the orchestra consists of about fifty musicians. The opera is entirely supported at the king's expence, and rendered in some degree subservient to the ends of government. The extreme delight the king takes in music, and his great knowledge in that science, have carried this entertainment to a very high degree of perfection. In the upper galleries on each side of the stage are seated six trumpeters, who salute the queen consort when she enters the house or retires; but the king himself, who is superior to the rules of ceremony, will not allow this flattery to his own person.

In the suburbs the houses are generally of timber; but so well plaistered, that they seem to be of stone, and the

streets are broad, straight, and lightsome. Here was the residence of the queen mother, who was sister to king George I. of England. This palace is named *Mon Bijou*, or *My Jewel*; it is a small elegant structure, beautifully furnished, and has very fine gardens that lie open to the river.

About five miles from the city of Berlin, is the palace of Charlottenburg, which was founded by the king's grandfather, and his present majesty has finished it according to his own taste, which is extremely elegant. There is a range of about ten apartments well disposed, adorned with white stucco and gilding. The ball-room is worthy of the king who is said to have designed it: it has ten windows on each side, and besides the stucco and gilding, which are here richer than in the other rooms, it is adorned with busts, statues and large pier glasses. The gardens are laid out with taste, and the statues well disposed.

We shall now give some account of Brandenburg, a city from which the whole electorate takes its name; it is seated on the Havel, which not only divides the Old and New Town from each other, but separates the fort from them both, and likewise environs the New Town with a particular trench, on which a sluice has been erected. The Old Town contains about four hundred inhabitants, and the New Town about twice that number. They are both under one magistracy, and each contains two churches. The fort resembles a suburb, and in it is the cathedral church; the houses of the greatest part of the members of the chapter; and a riding school, in which young noblemen are instructed. The bishopric is secularized; but the chapter is still kept up, and consists of seven persons, who are the provost, the dean, the senior, the sub-senior, and three other canons. In 1755 king Frederic II. conferred upon it a peculiar distinction, and consisting of a chapter cross of gold enamelled with violet, terminating in eight points. There is here a small colony of French Calvinists, with a manufacture of cloth, fustian and canvas; and in this town a pretty good trade is carried on by means of the Havel.

Potsdam, which lies four miles to the south-west of Berlin, is agreeably situated on a branch of the Spree; it is of considerable extent, and the buildings neat and regular. The elector Frederic-William made this his seat, and in 1662 built the castle, which was afterwards enlarged by king Frederic I. and adorned with a fine portal. King Frederic William began to erect some costly additions to the town, for which purpose he caused several morasses to be filled up and built upon, with a canal fifty paces wide and two thousand in length, to be carried on from the Havel, through the center of the town, to a branch of the same river. This canal is planted on both sides with trees, and environed with well-built houses. King Frederic II. has raised the castle one story, enlarged it with two wings, and adorned it with magnificent apartments. The old houses in the neighbourhood of the castle are pulled down, and, instead of them, new, regular, and grand buildings have been raised for the owners at the king's expence. The apartments are remarkable for their elegance, particularly his majesty's writing-chamber and study: the last is partitioned off by balustrades of silver. The frames of the looking-glasses and the embellishments of the tables are of the same metal. The officers dine every day in a large apartment at the king's expence. His majesty here avoids the empty ceremonies of a court. The allowance of his table is but thirty crowns a day, fish and wine excepted, in which he is at no great expence. The king entertains at his table twelve persons: those of his ministers most in favour are first invited, with those of foreign princes, who happen to be at Potsdam, and his officers, even to an ensign, fill up the vacant places. The throne in the audience-chamber is richly embroidered with the arms of the house of Brandenburg, supported by two Herculeses. In one of the apartments are two curious figures in copper of a Chinese man sitting, and a woman of the same country holding an umbrella over his head. These figures, which are richly gilt, stand in an oval niche, lined with marble, and form a very convenient stove.

Before the castle is a large square adorned with Roman columns, in which the soldiers that lie here in garrison are daily exercised. The garden adjoining to the castle is beautifully adorned with water-works, gilding, and statues, which are large and elegant, particularly a Neptune and Amphitrite seated in a sea-car, in a large basin, opposite the east front of the palace. The stables are contiguous, and furnished with good English hunters.

In the market-place is a pyramidal obelisk of four sides, composed of variegated Silesian marble, seventy feet high, fixed on a pedestal of white Italian marble, at each corner of which is a small statue of the same; and on the center of each side stands a marble bust of the kings, from Frederic I. to Frederic II.

The town church, which is at a small distance from the castle, is a fine structure. The garrison church is large, and has a marble pulpit, under which is the monument of king Frederic William: it has a lofty and beautiful tower, in which is placed a fine set of chimes. The French church is a neat building, adorned with a cupola, and the church of the Holy Ghost has also a lofty tower. The council-house is a new building that has an elegant cupola. In a large orphan-house, founded in 1724, are maintained, clothed, and educated above two thousand soldiers children of both sexes; and belonging to it is one Lutheran and one Calvinist preacher. In this town is a foundery for arms, and a velvet and silk manufactory.

Near the town are a great number of vineyards, for the planting of which the elector Frederic William caused layers to be brought out of the best wine countries. In the park, which is adorned with vistas in the form of a star, stands a royal hunting-house, called the Star.

At a small distance from Potsdam is Sans Souci, or Without Care, a royal palace devoted to retirement. King Frederic II. soon after his accession to the throne, caused this palace to be erected on a desolate eminence, in a fine and grand taste, both within and without. This eminence is cut into six terraces, to each of which is an ascent of twelve steps, and against the walls upon each terrace are planted the best vine stocks, which are kept under glass-cases. On the upper part of this hill, which affords a view of the town, and its adjacent territories, stands the palace, which is but small, and only one story high; yet, on account of its regularity, elegance, and ornaments of sculpture and painting, is much admired: among these is to be seen the statues, from the cabinet of antiques, formerly in the possession of cardinal Polignac. In the center of the palace is a round hall lined with marble, adorned with magnificent columns and excellent paintings; but is particularly admired for the beauty of its floor, the marble of which is disposed in the form of flowers, after the Florentine manner, and strikes the eye very agreeably. On its top is a cupola, which supplies it with sufficient light. One of the apartments in this palace is wainscotted with cedar, ornamented with foliage of gold; and in this apartment is kept a small library. Behind the palace is a covered semi-circular passage, adorned on each side with columns. The palace is encompassed on three sides with gardens, which have several fine statues, particularly of a Venus drawing a net, and Diana with game; the pedestals of which are adorned with reliefs. These gardens, which do not extend above half an English mile in length, are terminated on the east end by an Egyptian pyramid embellished with hieroglyphics. They have, however, no gravel, and their sandy walks, in our author's opinion, rob them of half the beauty they might otherwise have.

Frankfort on the Oder is finely situated on that river, in the fifty-second degree twenty minutes north latitude, and in the fourteenth degree fifty-three minutes east longitude from London. The Oder, over which there is a large bridge of timber, divides it into two parts. The streets are wide, the houses well built, and the market-place spacious. There is here a cathedral and two churches, one of which belongs to the Calvinists; and an university, the professors in which are partly Calvinists and partly Lutherans. There is here also an academy for

martial exercises, a Lutheran free-school, and another for the Calvinists called Frederic's school. This city was formerly one of the Hanse-towns, and had a very considerable trade, which is at present much decayed. The inhabitants deal chiefly in linen cloths and fells, which they send to distant parts of Germany by the Oder, and the canal between that river and the Elbe. However, it has annually three great fairs. This city has suffered various revolutions: it was put under the ban of the empire by the emperor Charles IV. and, to pacify him, the inhabitants were forced to pay him twelve thousand marks of silver. In 1631 the Swedes took it by storm, when they had the cruelty to put all the inhabitants to the sword, to revenge the massacre of two thousand Swedes, whom count Tilly, the emperor's general, had inhumanly put to death in the city of Brandenburg; but the place was restored to the elector by the peace of Westphalia.

SECT. XI.

Of the New Mark, the Ucker Mark, the Old Mark, and the Prignitz; with the most remarkable Places in each.

WE shall now proceed to the New Mark, which lies to the east of the country last described, and is a long tract of land, which to the west is separated from the Middle and Ucker Mark by the river Oder; to the north it terminates on Pomerania; and to the eastward on Pomerania, Poland, Silesia, and Lower Lusatia; being in its greatest length about a hundred and sixty-nine miles, and in its greatest breadth forty-seven.

The soil is for the most part sandy; but the circles of Konigsberg, Soldin, Friedeberg, and Arnswalde have good corn-lands. Near the rivers are luxuriant pastures; but the grass in many of them is coarse and rushy. It abounds in wood, but has a sufficiency of fruit, garden-plants, game, and fish. Some of the circles produce wine, and likewise yield great quantities of iron.

The New Mark contains thirty-eight towns, and, as the burials amount one year with another to about five thousand seven hundred, the number of the inhabitants may be estimated at two hundred and sixteen thousand. The Lutheran churches are divided into twelve inspections, and those of the Calvinists consist of five congregations. The New Mark has a regency of its own, which consists of a president, and four counsellors, two of whom are nobles, two commoners, one prothonotary, and four clerks. It has also its own particular consistory and criminal court of justice; as likewise a board of war, and a chamber of domains. Revisals and appeals indeed lie from it to the exchequer at Berlin; but it has been agreed, that it should determine in cases relating to the New Mark only by way of commission, and not as a superior court.

The New Mark consists of the town of Kustrin, of seven original circles, and of four incorporated circles.

Kustrin, the capital of the New Mark, is situated in the fifty-second degree thirty-five minutes latitude, fifteen miles to the east of Berlin. Its proper name is Koztryn, that is a Rush Basket, which is the name of a large lake that abounds with rushes, between this city and Sonnenburg, and from which it received this denomination. It is seated on the river Oder, which, a little above this city, receives it into the Warte. The adjacent country is marshy, on which account the approach to it on the side of the Middle Mark is by means of a causeway, that extends above three miles in length, and has no less than thirty-six large and small bridges: the approach also to one of the suburbs is over a causeway of seven bridges. Its situation therefore is very strong, and it is defended by good fortifications. Though the city is small, its suburbs are very extensive. Before the year 1758, there were in the town and fort about two hundred houses, an old mansion house, and a church, in which the Calvinists used to perform divine service; together with a Lutheran parish church, the garrison church, three arsenals, one salt house, and three magazines. There were also a church and two hospitals in the suburbs; but in the above year, the Russians setting the town on fire by means

means of bombs and red-hot bullets, it was reduced to a heap of ruins. The fortifications, however, held out against all their attempts, and on the approach of the king of Prussia, the Russians precipitately raised the siege.

The other towns in the circles just mentioned are inconsiderable, and we shall not trouble our readers with describing a number of places, none of which have any thing remarkable.

We shall now proceed to the Ucker Mark, which to the north and east is bounded by Pomerania, and the New Mark, being for the most part separated from the former by the Welse and the Rando, and from the latter by the river Oder; to the south and west it is bounded by the Middle Mark, and the duchy of Mecklenburg. Its greatest extent is about sixty-one miles in length, and fifty-two in breadth. This province was anciently called Uckerland, or simply the Ucker, which name is doubtless received from the lake and river Ucker. This lake, which is the largest in all the electoral Mark, extends about nine miles in length, and the river of the same name issues from it at Prenzlö.

The greatest part of this province is very fertile; for the inhabitants have so improved the soil, as to be able almost every year to export several thousand lasts of all kinds of grain, with which it particularly supplies Berlin. The parts adjoining to the rivers have good meadow grounds; but in other places the graziers is so inconsiderable, that a great number of horses and black cattle are bought up by the inhabitants in Pomerania and Poland. The country, however, abounds in sheep, which turn to good account. It also produces fruit, hops, and honey, with plenty of tobacco; but in some places the inhabitants are in great want of fuel, with which they are partly supplied from the neighbouring districts; but other parts abound in fine woods of oak, beech, and pine.

The principal court of judicature in the Ucker Mark, to which appeals lie from the towns and courts of the nobility, is held at Prenzlö. This court consists of a president and four assessors, two of whom are noblemen, and two commoners. The three first are constantly chosen out of the ancient families of the Ucker Mark, and of the two latter, one is always first burgomaster of Prenzlö.

The Ucker Mark is divided into two circles, in which are nineteen cities, besides castles and market-towns, and the villages are computed at three hundred seventy-five.

The principal place in this Mark is Prenzlö, the capital of the country, which is seated in a very fruitful plain, on the lake and river Ucker, and is large, well built, with straight broad streets, and is divided into the Old and New Town. The revenues arising to the corporation from the city mills, its several farms, and large woods, are considerable. There is a numerous French colony settled here, whose judge is invested with power over all the French colonies in the Ucker Mark. This city formerly contained three convents, two of which have been given to noblemen, and the third converted into an alms-house. It has at present six churches, that is, three parochial churches, in the Old City, one in the New City, a church of German Calvinists, and one of French protestants. Here is also a good Latin school, and the city carries on a very considerable trade in cattle, corn, and tobacco; for the last of which it is particularly famous, as it is also for its manufacture of cloth.

The next town we shall mention is Templin, which is situated on the lake Dolgen, and contains an ecclesiastical inspection. In 1735, it was totally consumed by fire, but has been re-built to very great advantage: its streets being now broad and straight, and its houses uniform. It has a spacious market-place, which forms a regular square, and it is one of the most beautiful towns in all the Mark. It carries on a large trade in timber, which is greatly promoted by means of a canal newly made, to form a communication with several bodies of water, particularly with the lake of Fahr, which is about seven English miles in length.

The Old Mark is bounded towards the east by the Elbe, which separates it from Prignitz, and the duchy of Magdeburg; on the south, and part of the west, by the latter; and on the other part by the duchy of Lunenburg, extending nine German miles from east to west, and eleven from north to south.

This country has in many parts a fat clay soil; but in some places is sandy or stony; yet in general it may be styled a fertile country; indeed considerable morasses and waste grounds have been rendered fruitful, by forming of ditches and canals, by which means their pasturage and breed of cattle have been considerably improved. This Mark is computed to have at present fourteen small towns, five hundred sixty-four villages, and ten manors.

The supreme tribunal of the Old Mark is seated at Stendal, and the provincial captain is president of that court. The principal towns in this district are,

Stendal, the capital of this mark, which is seated on the Uchte, in a plain surrounded on all sides by mountains. It is divided into four parishes, which have four principal churches, among which is the cathedral of St. Nicholas. The town-school is in a building that was once a Franciscan monastery. The cloister of St. Catharine was formerly supplied with Benedictine nuns, and that of St. Anne with nuns of the order of St. Francis. After the reformation these cloisters were preserved, but came over to the Protestant religion, and over each of them was set a Domina. This place was formerly one of the Hanse towns, and carried on a great manufacture of woollen cloth. The French refugees who have settled here, have since the loss of that trade, introduced several manufactures, and have a tribunal of their own.

Saltzwedel, is a town seated on the Jeeze, in a low and marshy soil, and consists of the Old and New Town, each of which has its separate limits, gates, churches, schools, and magistracy. In the Old Town is the church of St. Mary, in which was formerly a provostship; but it is at present the superintendency of the spiritual inspection of Saltzwedel. Two churches, both of which belonged to cloisters that formerly stood here, are in a good condition. The principal subsistence of the inhabitants consists in the brewing of beer, the making of linen cloth of various sorts, and the manufactures of serge, frieze, and stockings, and a brisk trade is carried on here.

The last division we have to mention in the marquise of Brandenburg is the Prignitz, which terminates on the Elbe and Havel, the duchy of Mecklenburg and the Middle Mark, and is ten German miles and a half in length, and seven and a half in breadth, and contains seven circles, in which are eleven towns, and two hundred forty-six villages. The principal places in this district are,

Perlberg, the capital of the province, is situated on the Stepenitz, which here divides itself into two branches, one of which passes by the town; but the other dividing itself again runs in two streams through the center of the town. Perlberg contains about three hundred and seventy dwelling houses. At the principal church resides the inspector of the spiritual inspection of Perlberg. Near the hospital of the Holy Ghost is a small church, with a peculiar preacher and catechist. The inhabitants draw their principal subsistence from agriculture and the arts.

The Havelberg is seated on the Havel, by which it is surrounded, and rendered an island, to which there is no other passage than by three draw-bridges. A long bridge leads to the cathedral, and the hills situated beyond the Havel. Here was an ancient bishopric founded in the year 946, and the last of the bishops was the elector Joachim Frederic, no bishop being ever elected to succeed in his place; but the chapter still continues, and on the members of it king Frederic II. conferred, in the year 1755, a peculiar distinction and chapter cross of gold enamelled with purple, terminating in eight points. On the right side of it is seen the Prussian eagle, and on the four corners the letters F. R.; but on the other side is a representation of the virgin Mary, the patroness of the chapter, with the infant Jesus. This cross is worn pendant at a white watered ribbon terminated with purple.

purple. To this foundation belong three manors. A great quantity of brandy is distilled in this town, and many stockings knit. Here are also many fishermen, and boats for the Elbe are built at this place.

SECT. XII.

Of the Dutchy of POMERANIA.

Its Situation, Produce, Rivers, and Lakes. The Number of the Inhabitants, their Religion and Government; with the Division of the Country.

POMERANIA is bounded on the east by Polish Prussia; on the south by Poland, the New Mark and Ucker Mark; on the west by the Dutchy of Mecklenburg; and on the north by the Baltic. Its length along that sea is about two hundred eighty-five miles, and its breadth from thirty-eight to sixty-one. It was formerly of a much greater extent, reaching eastward as far as the Vistula, and southward including part of the New and Ucker Mark; while to the west it took in a part of the present dutchy of Mecklenburg.

The country is level, and of the few hills in it, that of Chollenberg is the principal. The soil is, indeed, in some parts sandy, but in most places it is pretty close and good; so that the inhabitants not only raise a sufficient quantity of wheat, rye, barley, and oats, but export a great deal. They likewise cultivate buckwheat, vetches, turnips, peas and beans, to great advantage, and in some parts millet, flax, and hemp. It also produces a sufficient quantity of fruit, and foreign esculent plants would likewise thrive here. In several parts of the country are fine heaths and forests, and among the latter, several are covered with oaks. The wood of these forests is not only used for fuel and the building of houses and vessels, but also serves for making tar and charcoal.

Those parts of the country that are improper for tillage, are made use of for grazing, which is here very considerable. The geese of this country are famous for their largeness, and in general the dried Pomeranian geese, hams, sausages, and salmon, are esteemed the best in all Germany.

In Hither Pomerania are some mineral and salt springs. The largest river in Pomerania is the Oder, which the Pomeranians call the Ader. This river forms three lakes below Stettin, after which it discharges itself into the Frischen Haff.

The other rivers of note are the Reckenitz, which is the boundary of Pomerania towards Mecklenburg. The Peene, which comes from the dutchy of Mecklenburg, and at last, after forming two lakes, falls into the Baltic. The Ucker has its source in the Ucker Mark, and, being joined by the Rando, pursues its course into the Frischen-haff. The Ihna rises in the borders of the New Mark, and dividing into two branches, which are again united near Stargard, becomes navigable, and at last discharges itself into the lake of Dam. The Rega, likewise rises in the New Mark, and after becoming navigable, and receiving the Mulso, enters the Baltic. The Persante issues out of the lake of Pakuvet, becomes navigable at Belgard, and being joined by the Raduye, forms a pretty good harbour: it is remarkable that an island in the midst of this river affords rich salt springs. The Wipper rises out of the Gewipp, receives the Grabo, and then becoming navigable, discharges itself into the Baltic. The Lebe rises near Lauenburg, and near Lebe forms the lake of that name, which is about three German miles in length, and discharges itself thro' a narrow outlet into the Baltic.

Besides the above lakes there are many others, especially in Hither Pomerania, several of which are pretty large. These lakes, as well as the rivers, abound in fish, and particularly great quantities of salmon, which are dried and exported to distant parts.

The situation of this country on the Baltic is very advantageous for navigation, though the coast of Pomerania, especially about the Oder, is very dangerous. Amber is found on the coasts of Hither Pomerania, but not in such quantities as on those of Prussia.

With respect to the number of the inhabitants, a judgment may be formed by that of the burials, which, taken one year with another, have amounted to about twelve thousand; whence the number of the living may be computed at about four hundred and sixty thousand. The greatest part of the inhabitants are of the Lutheran religion, tho' in some parts there are Calvinists, and in others Papists. The Lutheran churches are under the inspection of provosts, who are subordinate to the general superintendants.

The whole dutchy of Pomerania consist of sixty-eight towns, which are divided into immediate and mediate. The former of these are immediately under the supreme tribunals of the country, choose their own magistrates, and the governing burgomasters of the three capital towns of every province sit in the diets of the country. On the other hand, the mediate cities are either under the king's agents or noblemen, take the oath of fidelity and allegiance to their lords and patrons, attend their courts, and have the processes of their townsmen on an appeal moved from their magistracy to the courts held by those agents, or the noblemen. Their magistrates are likewise appointed by their lords, and confirmed by the regency.

Mr. Busching observes, that the electoral-house of Brandenburg had the nearest claim to Pomerania, when the family of the dukes became extinct, in 1637; but, at the treaty of Westphalia, all the Hither Pomerania, with the principality of Rugen and Farther Pomerania, Stettin, Garz, Dam, Golnau, the island of Wollin, the Oder, and the Frischen-hoff, were assigned to Sweden; all the elector of Brandenburg had was the remainder of Hither Pomerania, with the diocese of Cammin, which was changed into a temporal principality. Sweden likewise obtained the reversion of the Brandenburg part of Pomerania, on the failure of the male line of that house. But the crown of Sweden by the northern war, and the peace of Stockholm in 1720, lost the greatest part of Hither Pomerania, ceding for ever to Frederic William king of Prussia the city of Stettin, with the whole country between the Oder and the Peene; as also the islands of Wollin and Usedom.

The crown of Sweden appoints a governor general, who resides at Stralsund, over Swedish Pomerania; and in that city is kept the regency, war-office, and court of appeals; but the highest court of appeals in Swedish Anterior Pomerania is held at Wismar.

The Prussian regency has its seat at Old Stettin, where are likewise kept the war and domain-offices, with the civil and criminal court of justice for both the Pomeranias. The whole revenue of both the Swedish Pomeranias amounted in the year 1753 only to one hundred and twenty-four thousand rixdollars, though Prussian Pomerania annually brings in the sum of eight hundred thousand.

With respect to the division of Pomerania into Anterior and Ulterior, or Hither and Farther Pomerania, it has not always been the same; but at present the country situated between the Reckenitz and the Oder is usually filed Anterior; as the country between the Oder and Polish Prussia bears the name of Pomerania Ulterior, and consequently the Oder must be considered as the boundary between them. We shall begin with Pomerania Ulterior, on account of its being situated to the east, and its being subject to the prince part of whose dominions we have last described.

SECT. XIII.

Of Pomerania Ulterior, and that Part of Pomerania Anterior which is subject to the King of Prussia; with a concise Account of the principal Towns contained in each; and of the Islands Usedom and Wollin.

THE Farther Pomerania, including the principality of Cammin, belongs entirely to Prussia, and contains a considerable number of towns, the principal of which are the following:

Stargard, also called New Stargard, the capital of all Farther Pomerania, is seated on the Ihna, by means of which it has a free communication with the Baltic, in

in the midst of a country that produces plenty of corn; is an immediate town, large and well built. The church of St. Mary is thought to have the highest roof in all Germany; besides this, there are several other churches belonging to the Lutherans, and the German and French Calvinists. There is here a college founded in 1631, and a free-school kept in a suppressed convent; and it has several good manufactures. This town was taken by the Russians in the year 1758.

Cammin, a sea-port town, seated on the eastern mouth of the river Oder, opposite to the isle of Wollin, in the fifty-fourth degree ten minutes latitude, and the fifteenth degree two minutes east longitude. This place was always in mean circumstances, till it became subject to the Prussian government, when it rose to such prosperity as to make a very good figure, and to have handsome suburbs. This is chiefly owing to its navigation, fishery, and agriculture. The bishopric of Cammin was, by the treaty of Westphalia, changed into a temporal principality, and given to the electoral house of Brandenburg; it was at the same time agreed, that on the decease of the canons then living, the electoral family should be at liberty to abolish the chapter; but this chapter still subsists, and is kept at the town. Near the cathedral stands a school, besides which Cammin contains a provostship and a foundation for ladies.

The principality of Cammin derives its origin from the suppressed bishopric of that city; for at the peace of Westphalia the bishopric was converted into a temporal principality of the empire, and this intitled the electoral house of Brandenburg to a seat and vote for this principality both in the circular and imperial diets. The most remarkable places in this principality are,

Colberg, an immediate and well fortified town, seated on the Persante, which, at a small distance, falls into the Baltic, and forms the convenient harbour of Munde. This town is the metropolis of the principality; it is pretty large, and, from its woollen and linen manufactures, its trade with Poland, and its numerous shipping, is in a flourishing condition. It has a collegiate church, to which belongs a provost, a dean, a chanter, and rector; with a religious foundation for young ladies in the building that was formerly the ducal palace: it has also three other churches, and a Latin school. In the neighbourhood are caught a great number of salmon and young lampreys, and in a meadow surrounded by the Persante are some salt springs: little salt, however, is made on account of the scarcity of fuel, which the inhabitants convey hither by means of the Persante, at a very great expence. In 1758 this town was bombarded by the Russians, but without effect.

The last town we shall mention in Farther Pomerania is Coslin, which is seated ten miles to the east of Colberg, on the river Nisebec. In the times of popery here was an image of the Virgin Mary, which drew hither many pilgrims. In 1504 Coslin was entirely destroyed by fire, and in 1718 the greatest part of it was again consumed; but since this calamity it has been rebuilt to advantage, particularly the large square market-place, which is very handsome, the houses being all two stories, and of an equal height. In the center stands a stone statue of Frederic-William, erected in 1724, according to the inscription, in grateful remembrance of the royal munificence displayed in rebuilding the town.

The principal places in Anterior Pomerania subject to the king of Prussia are the following:

Stettin, Stetin, or Old Stettin, is seated on an eminence near the river Oder, which is here divided into four branches, and stands in the fifty-third degree thirty-six minutes latitude, and in the fourteenth degree ninety-six minutes east longitude. This city is large, handsome, well fortified, and the capital of the Prussian Anterior Pomerania; as also the residence of the regency, both for the Anterior and Ulterior Pomerania. It has a college of physicians, with a board of health, a chamber of commerce instituted in 1755, a royal seminary, and a general superintendency of the Hither and Farther Pomerania. It has a castle, in which the above colleges meet, and an arsenal; together with the church of St. Otten, which was formerly collegiate; the cathedral of St. Mary, to which belong very considerable estates; five parish churches, a French Calvinist meeting, and a mass-house.

It has also a dock for the building of ships, with a court of admiralty, and has not only various manufactures, but the inhabitants carry on a very great foreign trade. It exports salt and fresh fish, naval stores, as planks, masts, and other wood, for building and fuel; pipe-staves, clapboards, canvas, dimity, flannel, linen yarn, and cloth; starch, arsenic, glass, antimony, lapis caliminaris, madder, pot-ash, soap, tobacco, honey, wax, rosin, corn, and many other articles to England, Holland, France, Spain, Denmark, Norway, Sweden, Prussia, Dantzic, Mecklenburg, Lubec, and Hamburg. It is, in short, the centre for exchanging the commodities of Poland and Germany with those of the Baltic.

Anclam is seated in a fertile country on the river Peene, having on the one side of it marshes and meadows, with a dyke of stone above a mile in length, and on the other deep moats and walls. This town contains two parish churches, enjoys a good trade both by land and water, and has prospered greatly under the Prussian government. In 1757 and 1758, it fell several times into the hands of the Swedes: for the other side of the river being within the Swedish territories, the centinels of that nation are posted very near it. It is the capital of a circle to which it gives name, that is near three German miles in length, and contains seventeen villages. To it belongs Anclam ferry, on the Frischen Haff, where is a fort, to which all the ships that pass by pay a toll.

The island of Usedom, which commands the navigation of the Peene, the Ucker, and the Oder, is bounded on the north by the Baltic; on the east by the streight called the Swin, which separates it from the island of Wollin; on the south by the Frischen Haff; and on the west by the Achter water, which is famous for its plenty of fish. This island is about five German miles in length; but in some parts is very narrow, and where widest is only between three or four miles broad. It is seated in the fifty-fourth degree north latitude; and contains the following places. Usedom, a small immediate town, that has an old castle. Penemunder-Schanze, situated on the north point of the island, which it entirely commands. The Swin-Schanze, on the south east part of the island, which was destroyed by the Swedes in the year 1757; but a new town has since been built. The island also contains several villages.

The island of Wollin, is bounded by the Baltic Sea on the north; by a streight called Wollin-Water, or Diveno to the east; by the Frischen-Haff to the south; and by the passage of the Swin on the west. This island is frequently in danger of being overflowed, and the sea winds are continually throwing up against it drifts of sand. It is about twenty English miles in circumference, and produces excellent cattle, with plenty of game and fish. On this island stands Wollin, an immediate town, situated on the waters to which it gives name, and has a bridge over it leading to Anterior Pomerania. There are also ten or twelve villages on the island.

S E C T. XIV.

Of the island of Rugen, and the rest of that part of Anterior Pomerania subject to Sweden, with the principal Places contained in each.

THE island of Rugen is seated in the Baltic, about two miles and a half from the continent, and was antiently celebrated for the courage of the Rugii its antient inhabitants, from whom it takes its name. It formerly extended as far to the east as Ruden, which is now at three leagues distance; it being parted from it by a violent tempest in the beginning of the fourteenth century, when the sea drowned a great part of the island. It is, however, still thirty miles long, and nearly the same broad; but so full of creeks and peninsulas, that scarce any part of it is above three miles from the sea; and one creek on the east, runs almost through to the west side: but the peninsulas are so guarded by rocks, as to be no longer in danger from inundations.

The soil here is so fruitful in corn, that this island is called the granary of Stralsund, some thousand lasts being annually shipped from hence for that city. There are likewise bred abundance of cattle in the island, which likewise yields prodigious plenty of fish; but is supplied with fuel from Pomerania, though some places afford turf.

Rugen contains twenty-seven parishes, which are divided into four provostships. The principal town in the island is Burgen, which is situated in the middle of it, and is the seat of the provincial court of justice, a prefecture, and a provostship: it is likewise the residence of a governor, and the place where the nobles hold their assemblies. In it is a protestant convent for young ladies, consisting of a prioress and eleven sisters. This convent has likewise two curators belonging to it, who are nobles, one of whom is always the governor. This town has frequently suffered by fire, particularly in the years 1715, and 1726.

Near this island there are several others, particularly Ruden, which is situated amidst shoals and sand banks, and has a castle. The island of Unmanz, which lies to the west of Rugen, and the island of Hiddensee or Hiddenso, which also lies to the west of Rugen, and is about ten miles in length, though in most places it is not above two miles broad. The soil is sandy, and affords little corn.

We shall now return to the continent of Swedish Pomerania, the principal place in which is,

Stralsund, the capital, which is a free city, that lies on a strait of the sea opposite to the island of Rugen, in the fifty-fourth degree twenty-six minutes latitude, and the thirteenth degree twenty-two minutes east longitude. It derives its name from the narrow Sund or Strait that lies between it and the little island of Danholm, and is very strong, it having very good fortifications. On the land-side are bulwarks and fish-ponds two musket-shot in breadth, besides large ditches and marshes, only passable by four causeways, from four gates all fortified. It has an excellent haven, where ships come up into the very heart of the town; so that it has had a considerable trade both by sea and land. Here are great quantities of honey, wax, tar, pitch, rosin, hides, tallow, linen, and a good sort of canvas, which is made here. The streets are broad, and the houses pretty uniform. This city is the residence of the king's governor general of the regency, and is the place where the states of Swedish Pomerania hold their meetings. It has also its own consistory and a seminary. Among its citizens, who form a numerous body, are many substantial merchants. In 1714 Charles XII. king of Sweden, ennobled its magistracy, and in 1720 king Frederic I. extended this honour even to the members of the council. It was formerly one of the principal Hanse-towns; but it has suffered greatly by the ravages of war. In 1628, it held out a siege against the Imperialists under general Wallenstein; but in 1678, was so furiously bombarded by Frederic William elector of Brandenburg, that it surrendered on the third day of the siege, after the destruction of about eighteen hundred houses; and in 1715 was taken by a combined army of Russians, Danes, and Brandenburgers.

SECT. XV.

Of the Principality of ANHALT.

Its Situation, Extent, Climate, Produce, and Rivers: the Religion of the Inhabitants; the States of the Country: with a concise Account of the Princes of Anhalt, their Titles, and Arms.

THIS principality is bounded on the north-east by the mark of Brandenburg; on the east by the electorate of Saxony; on the south by Misnia; on the south-west by the county of Mansfeld; and on the north-west and north by the duchy of Brunswick, the principality of Halberstadt, and the duchy of Magdeburg. It is remarkable that at Haderholz, near Heidelberg, the territories of Brunswick, Anhalt, and Stolberg meet in such a manner, that the three sovereigns may sit at the same table, and each be in his own dominions. This principality is sixty-six miles in length, and in breadth about eighteen, though in some places more.

On the forest of Hartz the air is fresh and healthy, but rather too cold. The harvest is later than in other places, but the plains enjoy a milder air, though in some places they are not so healthy as in the high lands. The soil is various: for in the districts of Cothen and Bernburg the earth is compact and fat, and particularly fertile in wheat and barley; while the light and sandy countries of

Deßau and Zerbst are adapted to rye; but they have some tracts of a firmer texture. Tobacco is also planted in the country of Deßau; the land every where produces not only plenty of culinary and other herbs, but also fruits; though on the Hartz the latter never arrive to their proper ripeness. Here are likewise hop-grounds and vineyards; but the former answer better than the latter. In Cothen and Bernburg fuel is scarce; but Zerbst and Deßau are plentifully provided with it, particularly the Hartz, where are fine woods of oak, beech, poplars, elms, limes, &c. and in general it is a fine sporting country. The mines in the Hartz yield silver, copper, lead, iron, sulphur, vitriol, coals, allum, salt-petre, and other minerals.

The graziery in this principality also varies according to the difference of the soil, and the rivers yield excellent fish.

The rivers of Anhalt are the Elbe, which traverses the center of this principality; the Milde, or Mulde, which runs into the Elbe; the Saale, into which the Wipper discharges itself; the Seike, which falls into the Bude, while the last discharges itself into the Saale and some others. The lake of Gaterleben, which was nine miles in length, and in some places about four broad, has been drained, and converted into corn land and pastures.

Christianity was introduced into this country in the ninth century, and the Reformation began to take place in the diocese of Gernrode in the year 1521, and spread itself with a swift progress over the whole country. The possessions belonging to the monasteries were employed in augmenting the revenues of the alms-houses and churches, in the founding of schools, and the establishment of stipends and exhibitions. The whole country professed Lutheranism till the year 1596, when the Calvinist religion was introduced, and the several churches, both in the towns and villages, in the patronage of the sovereign, were filled with Calvinist ministers. The parishioners, however, were allowed to enjoy their own opinion, and both the nobles and their vassals were permitted the free exercise of the Lutheran worship. By virtue of a compact made in 1679, the Lutherans are allowed to erect new churches. The Zerbst line, with the greatest part of its subjects, professes Lutheranism; but the three other lines are of the church of Calvin, which is the established religion in their respective territories.

In the whole principality are nineteen towns, and two boroughs. For the instruction of youth in literature, the towns are endowed with Latin schools, and there is an university at Zerbst which belongs in common to all the princes of Anhalt.

The states of the country are composed of the nobility, who are very numerous, and likewise of the towns: out of the former are chosen a sub-director and three provincial counsellors, who, with the four senior burgomasters of the four residentiary towns, form the lesser committee. The great committee consists of twenty persons, that is twelve noblemen and eight burgomasters, two out of every residentiary town. Besides these there is a commissioner of the revenue, who is assisted by a secretary and syndic. The diets are assembled in the name of the four several princes of the house of Anhalt, who also direct the proceedings. They generally meet in the residentiary town, where the senior of the princely house resides, though upon occasion another place may be chosen.

The four reigning princes of Anhalt are all descended from the same family, who consider Joachim Ernest II. as the founder of the present house of Anhalt, who dying in 1586 left seven sons, of whom the third and fourth died without heirs, and Augustus IV. lived in retirement at Plotzkau, without requiring any part of his father's lands; but the four other brothers divided their father's territories into four parts, prince John George I. obtaining Deßau, prince Christian I. Bernburg, prince Rodolphus Zerbst, and prince Lewis Cothen. The son of the last of these princes dying in 1665 without heirs, his share of the country was by the other three lines conferred upon Leberecht and Immanuel, sons to the above-mentioned prince of Plotzkau, who, on their side, ceded Plotzkau to Bernburg. The right of primogeniture takes place in all these four lines.

The titles of these sovereigns are, princes of Anhalt; dukes of Saxony, Engern, and Westphalia; counts of Ascania;

Afcania; lords of Bernburg and Zerbſt. The Deſſau line likewise inſerts in its titles the lordſhip of Gropzigk, and the Zerbſt line thoſe of Zever and Kniphaufen.

The arms for Anhalt conſiſt of nine fields: in the dexter chief point is argent, a bear, with a collar, ſable and or, and a crown or, placed paſſant, on four turrets gules, on a wall with a gate, ſignifying the antient bearings. In the ſecond are five pales ſable, for the lordſhip of Barenſtadt. In the third chequée argent and ſable. In the fourth chequée or and gules, denoting the county of Walderſee. The fifth argent an eagle counter-changed, the claws and bill or, winged with a ſemi-circle of the ſame in a field argent; as likewiſe five pales and a wreath of rue, in a field or, and in this field the Saxon and Brandenburg arms are mutually quartered, to expreſs their common origin. In the ſixth azure, are two bendlets from the left to the right for the county of Warmſdorf. In the ſeventh an eagle argent, in a field azure for the county of Mulingen. The eighth is pure gules, and termed the bloody banner, or bloody ſhield, with the regalia coat. In the ninth is a bear ſable, with a collar argent, ſtanding on a wall gules, with a gate ſable, and three battlements gules, to denote the lordſhip of Bernburg.

Since the year 1689, when the dutchy of Saxe Lauenberg became vacant, the houſe of Anhalt having a claim to it, have quartered three other ſhields with their arms: firſt the arms of Saxony, conſiſting of five pales, with a wreath of rue, to denote the dutchy of Saxony. The ſecond an eagle diſplayed and crowned or, in a field azure, for the palatinate of Saxony. The third three beetles horns or, a ſemi-circle gules, in a field argent, for the antient county of Bree. The Zerbſt line alſo bears three particular ſhields, a lion or, for the lordſhip of Zever; a lion ſable, in a field or, for the lordſhip of Kniphaufen; and a hound's head, with a collar or, placed between two wings argent, in a field azure, for the bailiwick of Walter-Nienburg.

All the four reigning lines enjoy collectively for the principality of Anhalt, both in the college of princes at the diet of the empire, and in the diets of Upper Saxony, only one vote; but the antient abbey of Gernrode intitles them to another in both thoſe aſſemblies.

Each of the reigning lines has its regency, exchequer, and conſistory. The annual revenue of the whole principality of Anhalt to the four reigning lines, is eſtimated at between five and fix hundred thouſand rixdollars.

We ſhall now give a particular deſcription of the principal places in the ſeveral parts belonging to each line: and ſhall only firſt obſerve, that, according to a very good author, the people of theſe four little independent sovereignties, in the opinion of the Saxons, live in the land of milk and honey; the princes poſſeſs lands ſufficient for their expences, and the taxes laid on the people are very inconfiderable. The ſecurity with which a perſon travels in this part of the world is very extraordinary. The people are ſober, and the duties of morality are taught not only by the miniſters, but by parents; whence thefts and robberies, in time of peace, are hardly known.

S E C T. XVI.

The principal Places in the Principalities of Deſſau, Bernburg, Cothen, and Zerbſt.

AS we have already deſcribed the country of Anhalt in general, and given ſome account of the conſtitution, nothing remains but to take notice of the principal places in the four ſeveral diviſions ſubject to its four princes, and we ſhall begin with Anhalt-Deſſau, which is divided into ſix bailiwicks; the principal places in which are,

Deſſau, the reſidence of the prince, which is ſituated in a delightful plain on the river Mulde, which, at a ſmall diſtance from the town, runs into the Elbe. It conſiſts of the town particularly called Deſſau, the New Town on the north ſide, the ſuburb called the Sand, another before the Mulde gate, and the Water Town on the other ſide of the Mulde. Beſides the prince's palace, which is a ſtately building, it has two Calviniſt churches, and one belonging to the Lutherans, with a grammar ſchool, an orphan houſe, and two alms-houſes. There

are here ſome good manufactures of cloth, ſtockings, and hats. In 1467 this town was entirely deſtroyed by fire.

Oranienbaum, a regular and pretty little town agreeably ſeated on the ſpot where formerly ſtood a village. Henrietta-Catharine, princeſs of Orange, and conſort to John-George II. in 1686, built a ſuperb villa of ſtone at this place, and named it Oranienbaum; which, with the other buildings belonging to it, is ſurrounded with a moat. Its garden is extremely beautiful. She afterwards raiſed the village to a town, and permitted new houſes to be built on a regular plan with the former.

To the houſe of Anhalt-Deſſau belongs alſo a conſiderable tract of land in the kingdom of Prussia.

Anhalt-Bernburg contains eight bailiwicks, the principal places in which are,

Bernburg, the capital and reſidence of the prince. This city is ſeated on the river Saale, or Sala, over which it has a handsome bridge of free-ſtone. This is a place of great antiquity, and conſiſts properly of three diſtinct towns. On the land ſide it is encompassed with walls and moats, and, beſides its magiſtracy, has a governor appointed by the prince, who preſides in the ſupreme court of juſtice. In the Old Town ſtands two churches, with a ſchool, the town-houſe, and the prince's ſecretary-office. A part of Bernburg, called Vordenburg, ſtands on a hill on the other ſide of the Saale, and is reckoned the third part of it, though it is under a diſtinct magiſtracy, conſtitution, and privileges. The church in this part ſerves both for the caſtle and court. The caſtle is one of the moſt antient, and at the ſame time the moſt celebrated fortrefs in the principality of Anhalt. It ſtands on a high rock, and is ſurrounded with a deep and lined moat; and below it runs the Saale, on which ſtands the noble ſtone sluice erected in 1696 by prince Victor Amadeus. The Auguſtine convent in this place was, at the Reformation, converted into an hospital and poor-houſe. To the north of the New Town lies the ſuburb of Waldau, in which is one church.

Hartzgerode derived its name from its being ſituated at the entrance of the foreſt of Hartz. Both the walls and houſes are built of a motley kind of marble, in which this country abounds. On its eaſt ſide prince William, in 1601, erected a new town, which, in 1705, was called Auguſtenſtadt; and oppoſite to it is a ſuburb called the Liberty, which has an hospital at the end of it. On the north ſide is the New Mine Town called Wilhelmſtadt.

Wilhelmshof, a houſe and farm belonging to the prince, lies in the foreſt not far from Hartzgerode: it is an elegant ſtructure, moſt delightfully ſituated. The building was compleated in 1582, and conſiſts of two ſtories. Farther in the foreſt, on a high and ſteep mountain, are to be ſeen ſome ruins of the antient caſtle of Anhalt, which are now overgrown with buſhes.

The abbey of Gernrode was originally a free temporal convent for ladies, founded in the year 960, and richly endowed: but the houſe of Anhalt reſuming it in 1624, it was confirmed in its poſſeſſions by the treaty of Weſtphalia; and by virtue of it, is intitled to a ſeat and voice among the prelates of the Rhine, both in the imperial diet, and that of the circle of Upper Saxony. The abbey itſelf is converted into a manſion-houſe. The town of Gernrode was at firſt only a village; but, on the additions made to the wealth of the abbey, the inhabitants, whoſe number increaſed, obtained ſeveral immunities and privileges. Divine worſhip is performed in the abbey church, that belonging to the town being for the moſt part uſed only at funerals.

The prince reſides in the palace of Schaumburg, which is ſituated in the circle of the Upper Rhine.

The principality of Anhalt-Cothen conſiſts of four bailiwicks, the principal town in which is,

Cothen, the reſidence of the prince, is ſituated on the little river Zitaſ, and conſiſts of the Old and New Town, which were incorporated in 1620. It is a conſiderable place, the inhabitants amounting to about fifteen thouſand. They have three churches, a Calviniſt and Lutheran orphan-houſe, and each has a free ſchool; among the other public buildings is an hospital. In this town the prince of Anhalt-Cothen has a palace. He keeps a body of two hundred and fifty men, who are well clothed; and

and his revenues, according to Mr. Hanway, are computed at one hundred and sixty thousand dollars.

We now come to the principality of Anhalt-Zerbst, which contains seven bailiwicks, the principal places in which are,

Zerbst, the residence of the prince, and the largest and handsomest town in all Anhalt. The prince's palace is very magnificent. In the town are two Lutheran churches, one belonging to the Calvinists, and an university common to all the princes of Anhalt, which has three Calvinist and one Lutheran professor; besides which here is also a Lutheran and Calvinist school. The beer brewed here, with its manufactures of gold and silver lace, are very profitable articles, though the first was formerly more esteemed than it is at present.

The prince of Anhalt Zerbst is also proprietor of the lordship of Zevee, in the circle of Westphalia.

We shall conclude this section with a concise account of the abbey and town of Quedlinburg, and the abbey of Walkenried.

The abbey of Quedlinburg was founded between the years 932 and 936, by king Henry I. and enriched by his cousin Matilda; but in 1539 embraced Lutheranism. It at present consists of four dignitaries, viz. the lady abbess and three others, distinguished by the titles of provost, dean, and canon. The abbess is a princess of the empire, and at the diet enjoys both a seat and voice on the bench of the prelates of the Rhine, as she likewise does in the diets of Upper Saxony.

The arms of the abbey are two carving knives or, placed in a saltire cross, with handles of the same in a field gules.

Antiently the house of Anhalt held the patronage or government of Quedlinburg as a fief from the abbey; and it afterwards continued a long time hereditary in the house of Saxony, by which it was at length transferred to the house of Brandenburg for the sum of three hundred thousand rixdollars; and, by virtue of an agreement concluded in 1574, between the elector Augustus and the abbess Elizabeth, no abbess, nor any other dignitary, is to be chosen without the knowledge of the patron.

The town of Quedlinburg, which belongs to the abbey, is situated on both sides the Bode, and has a court of justice dependent on the abbey, with a particular magistracy divided into two councils. The abbess, with the chapter, lives on a hill at the cathedral of St. Servatius. In the town are six churches, and the hospital of the Holy Ghost; and without the town is the hospital of St. Anne, and a college that was formerly a Franciscan monastery; and near the town stands also the church of St. Wipert.

Here is also the free abbey of Walkenried, which was of the Cistercian order, and possessed of several estates; but in 1546 the abbot introduced the Lutheran doctrine and service; but, at the peace of Westphalia, the patronage of the abbey was abolished, and it was rendered an hereditary fief, which is now subject to the prince of Brunswick Wolfenbüttele.

S E C T. XVII.

The Principalities of Saxe Weimar, Eisenach, and Gotha; with the principal Places in each.

SAXE WEIMAR, which lies in Thuringia, extends along the Ilm, which, after traversing the whole length of this principality, loses itself in the Saale. Its length, taken in its utmost extent, is about twenty-six miles, and its greatest breadth twenty-three; but considerable parts of this principality are detached from the main body.

The duke of Saxe Weimar has two votes, both in the diet of the empire, and in that of Upper Saxony.

The principality is divided into thirteen bailiwicks, the principal towns in which are the following:

Weimar, or Weymar, the capital, and the residence of the prince, is seated in a valley by the river Ilm. The new palace, called Wilhelmsburg, is a very noble building, and contains the duke's valuable library, a cabinet

of medals, and a gallery of painting; and in it is a whispering-gallery, like that of St. Paul's, in London. The old castle, which has a bridge before it, is called the Red Palace. The town church has always for its minister the superintendant-general of the principality, and contains the hereditary vault of the princes. The second parish church is that of St. James; and here is a seminary founded by duke William Ernest.

In the neighbourhood of this city is Belvedere, a seat of the princes, built by duke Ernest Augustus, which has very beautiful gardens, and a very fine greenhouse.

The principality of Eisenach, which is subject to the duke of Saxe Weimar, also lies in Thuringia, extending chiefly along the Worra and the frontiers of Hesse. The face of the country is mountainous and woody, and it bears so little grain, that the inhabitants are obliged to be supplied with a great deal of it from other places. However, the neighbourhood of Jena and some other tracts yield wine; it has also mines of copper, iron, vitriol and allum, and some salt-springs.

The inhabitants are Lutherans, and the duke of Saxe Weimar sits and votes in the diets of the empire and Upper Saxony as prince of Eisenach.

This principality is divided into nine districts, the principal towns in which are the following:

Eisenach, the capital of the principality, is seated on the Nesse, which here receives into it the Horfel. The prince's palace is a noble building. Here are the various colleges for the different branches of the government; besides an academy, a seminary for divans, and an orphan-house.

Jena, a town, situated on the Saale, or Sala, which washes it on the east and south sides. It lies in a pleasant vale, among hills that produce a great quantity of wine. The town forms an oblong square, and is surrounded with moats, walls, and high towers. There is here a celebrated university, in which is a very valuable library, an observatory, and physic-garden. There are several churches, and without the town are four suburbs: to the west lies a suburb before St. John's-gate, in which is a church and an orphan-house; eastward is a suburb before the Sala-gate; and northward is a suburb before the port, in which are the prince's gardens, ball-room, and other edifices; and to the southward lies a suburb without the Lober-gate. A delightful row of trees has been planted round the moats from the Lober to the Sala-gate, and from thence to the port.

The principality of Saxe Gotha, which lies to the southwest of that of Eisenach, abounds in grain and fruit; and in the southern division, which takes in a part of the forest of Thuringia, are several mine-works.

The rivers that rise in this principality are the Leina, which falls into the Nesse; the Apfelftatt, which runs into the Gera; the Nesse, which has its source in the territory of Erfurt, and traversing the principality of Gotha from east to west, discharges itself into the Werra, after it has received the Horfel, which also rises in this principality.

Gotha contains seven cities, five towns, and two hundred churches.

The established religion is that of Lutheranism, with respect to which, and the instruction of youth, there are some excellent regulations; particularly an inspector travels through the country, and makes enquiry into the state of the churches and schools.

The duke maintains two regiments, consisting of eight hundred men: of these one is quartered in the principality of Gotha, and the other in that of Altenburg. He also keeps a guard of a hundred and sixty soldiers, with a body of artillery.

The principality of Gotha is divided into twelve bailiwicks, the principal places in which are the following:

Gotha, the capital of the principality, is seated in a vale near the Leina, in the fifty-first degree twelve minutes latitude, and the tenth degree forty-one minutes east longitude. Canals, lined with stone, are drawn from that river through all the streets of the city, which is one of the best and handsomest towns in all Thuringia. Within the walls are nine hundred and six houses, besides many others

others which stand on the ramparts; and there are large suburbs. It has an hospital for the soldiers, with two schools for their children, and in the largest of the barracks the cadets are instructed in the several branches of the military art. Here is likewise a foundery for cannon and bells. Within the town is the bailiwick house, with two churches, a seminary, an alms-house for widows, and an orphan-house. The inhabitants carry on a considerable trade in woollen manufactures, as also in wood and beer, and besides the profits arising from agriculture, receive considerable advantage from its being the thoroughfare from Leipzig to Upper Germany.

On a hill above the town stands a fortified castle or palace, which affords an extensive prospect over the fertile plain. Here the sovereign, who is brother to the present princess dowager of Wales, and is one of our knights of the garter, keeps a splendid court. In this palace is a well provided armoury, with a very valuable library, which consists of about thirty thousand printed volumes, and two thousand manuscripts, and in the apartments belonging to it are the portraits of several persons eminent for their birth, high station, or learning. The cabinet of medals is said to be, next to those of the emperor, the king of France, the dukes of Florence and Parma, one of the most valuable in the whole world. The museum at Gotha is far from being contemptible. It contains a number of onyxes set in different kinds of work, which are valued at sixty thousand dollars, among which is one of admirable beauty, representing a man sitting with a spear in his hand, and a woman standing by him. The image of Lewis XIV. is to be seen here, cut out of a single amethyst. Here is a silver elephant on a pedestal of agate, with the caparisons of gold set with emeralds and diamonds; and among a multitude of other curiosities, are two or three earthen vases painted by Raphael, and a large copper bowl enamelled with black and white, ascribed to the same artist, which cost the duke ten thousand dollars. Here is also a good collection of pictures, the most remarkable of which are Paul Rubens, his mistress, and his disciple Vandyk, all painted in one piece by Rubens himself, a book in which Brugel the elder has exquisitely painted sixty-one portraits of persons of distinction, and a screen of seven large leaves, on which is painted by the same Brugel the most remarkable passages in the New Testament. Here is also a ring, in which is set a most curious watch. Among the works in ivory, are Augustus king of Poland on horseback, and fourteen hollow balls turned one within another. Here is a marshal's staff and a flageolet made of the cinnamon-tree; and a staff on which the passion of Christ is engraved with surprising minuteness; a landscape made entirely of corolines; the elevation of a palace, all of garden seeds, arranged with the nicest art; a gondola and crown both made of cloves.

There are also in the palace a church, in which is a very fine chapel, a mint, a laboratory for fire-works, and adjoining to it is a beautiful garden.

Without the gates is also Fredericsthal, a kind of banqueting-house, which is well worth seeing. Among the paintings in this last palace, is a large piece, representing the czar Peter on horseback, conducted by Mercury, Neptune, Fame, Courage and Plenty, with several other figures offering him gifts; and also a family history piece in four compartments, the first representing the carrying off the Saxon princes Ernest and Albert; the second, their rescue; the third, their magnificent reception at their return; and the fourth, the execution of the robbers.

The garden of the palace is small; but well laid out in walks, water-works, and parterres, adorned with busts and statues; among which are some good copies of the most celebrated pieces of antiquity. At the end of the garden is a delightful grotto, the pavement of which is variegated marble dug near Coburg; and the ceilings and walls are embellished with shells, ores, and figures in glass work. In the apartment of the second story are some curious paintings of flowers and vegetables. On one side of the grotto among several small jetteaus is the image of Neptune, and on the other that of Thetis.

Between Fredericsthal and the castle is a fine orangery, or green-house, kept in excellent order, where among a number of exotics are to be seen coffee and strawberry-trees.

S E C T. XVIII.

Of the Principalities of Saxe-Coburg, Altenburg, and Querfurt, with the most considerable Places in each.

THIS principality lies to the south-east of the forest of Thuringia, but belongs to Upper Saxony; to the north it terminates on the county of Schwartzburg, to the eastward on the diocese of Bamberg, to the southward on that of Wurtzburg, and to the westward on that of Henneberg. It is forty-three miles long, and sixteen where broadest.

The soil is mostly fertile; in the valleys along the rivers are fine pasture grounds, and the principal employment of the inhabitants consists in grazing and the breeding of cattle; it also produces a great deal of flax, and in the neighbourhood of Koningsberg are vineyards. The forests afford timber and wood for fuel. There are also mines of silver, copper, and iron; and there are here found pit-coal, gypsum, alabaster, and marble.

The river Itz or Itsch, which rises in the forest of Thuringia, traverses the country from north to south, and after receiving several little rivers, discharges itself into the Mayn. The Steinach, which has also its source here, and falls into the same river; and the Werra, which likewise rises in this principality, and flows into the county of Henneberg.

The inhabitants are almost all Lutherans, except a few Calvinists at Hildburghausen, where they have the free exercise of their religion. The people are employed in agriculture and trade, and the country produces such plenty of corn, that it has more than sufficient for home consumption. Its most usual exports, however, are black cattle, fatted sheep, and wool. The inhabitants of Sonnenberg deal in slates, hones, and gun-flints, wooden ware, pitch and pot-ash. The other towns pursue different occupations, and the whole country is provided with all manner of necessary artificers.

The principality of Coburg formerly belonged to the counts of Henneberg; but by marriage became annexed to the house of Saxony, and at length devolved to duke Ernest the Pious, the founder of the present line of the family of Gotha, who divided it among his sons; whence it comes at present to be divided between the houses of Saxe-Saalfeld, Saxe-Meinungen, Saxe-Hildburghausen, and Saxe-Gotha.

In the whole principality are ten cities and six towns, the principal of which are the following:

Coburg, the capital of the whole principality, and the residence of the duke of Coburg-Saalfeld, is situated in a valley on the Itsch, in the fiftieth degree thirty-two minutes north latitude, and the eleventh degree twenty minutes east longitude. It is defended by a strong castle on a neighbouring hill, where Luther chiefly resided during the diet at Augsburg in 1530. Both the town and suburbs are walled in, and the latter are larger than the former. The prince's palace called Ehrenburg is in the town, and contains the archives of the principality. The town is likewise the seat of the several offices of the government belonging to the house of Saxe Coburg-Saalfeld, as the privy-council, the regency, the treasury, and the consistory, and in the market-place stands the chancery. Here are four churches with a seminary called *Casimirianum*, from its founder duke John Casimir; a town school, a gold and silver manufactory, and one of porcelain. Without the town is an hospital, in which is a small church.

Hildburghausen, the residence of the duke of that district, is situated on the Werra, and contains many handsome houses, most of which are not only regular, and of an equal height, but the streets are broad and straight. In the market-place stands the town-house, in which the regency, treasury, and consistory have their meetings. Here is also a Lutheran church, to which is

annexed the superintendency of the principality of Hildburghausen, and the Latin school. In the old town is also the duke's palace, which is a large regular building, begun by duke Ernest in 1685, and in its church is a burial vault belonging to the family. In the New Town is a Lutheran and Calvinist church.

The principality of Altenburg borders to the west on the upper principality of Schwartzburg, and the principality of Weimar; to the north on the circles of Thuringia and Leipzig; to the east, on the circle of Leipzig and the lordship of Schonberg; and to the south on the circles of Ertzgebirg and Neustadt.

The soil is very fertile in corn, and also abounds in good pastures, whence grazing is carried on, and there is a large breed of horses. The country likewise produces plenty of wood, and the mines yield copper, cobalt, vitriol, and other minerals. The principal river is the Pleisse.

The religion of the country is Lutheranism, and the churches and schools are ranged under several superintendencies, over which is placed a general superintendent, who resides at Altenburg. The states of this principality are divided into those in the Altenburg, Saalfeld, and Eisenberg circles, and consist of the nobility and towns of these three districts, who have their principal meetings at Altenburg.

The chief towns in this principality are the following.

Altenburg, antiently named Pleiss, the capital of the principality, is subject to the duke of Saxe-Gotha. It stands high on an uneven spot of ground, and the castle, which is seated on a rock, is famous in history for being the residence of the former electors and dukes, and from hence the young princes Ernest and Albert, who were afterwards the founders of the two principal lines of the Saxon house, were carried off in the year 1455; but the princes were recovered, and those who had taken them executed. In the town is a stately building, in which the secretary's office is kept, and where the regency and consistory hold their meetings; two churches, one of which is a superintendency. Here is also a house for the education of young ladies of decayed families, a public seminary, a house belonging to the knights of the Teutonic order, a museum and library, and an orphan house.

Saalfeld, a pretty handsome town, seated on the river Sala, in a beautiful situation, amidst hills and meadows. This town and its district is subject to the duchy of Coburg Saalfeld. The palace here was begun by duke Albert, and for some time honoured by being the residence of the Saalfeld line, till on their acquiring a share of the principality of Coburg, they removed thither. In this town are three churches, and a good grammar school, with some manufactures of cloth of gold, and silk stuffs, and a smelting and vitriol house. On an eminence near the town stands the once celebrated and rich Benedictine abbey of St. Peter, whose abbot was a prince of the empire, and had both a vote and seat in the diets, and the privilege of coinage. The lands belonging to this abbey are converted into bailiwicks, and belong to the family of Altenburg.

We shall now give a concise account of the principality of Querfurt, which belongs to the duke of Saxe-Weissenfels, and is surrounded by the county of Mansfeld, the diocese of Merseburg, the districts of Freyburg, Wendelstein in the circle of Thuringia, and by part of the territories of Eisenach. The principal places in this principality are,

Querfurt, a charter town, seated on the little river Weite. It is very small, it having only about five hundred houses; but it has large suburbs, and is defended by a castle seated on a hill.

Heldrungen, a small town seated near the Unstrut, which is the seat of a superintendency, and had formerly a strong castle. But it is of little purpose to enumerate towns that have nothing worthy of notice.

S E C T. XIX.

Of the Principality of SCHWARTZBURG.

The Situation of its two separate Parts; their Produce, Rivers, Government, Arms, and the principal Places belonging to each of the reigning Princes.

THE principality of Schwartzburg has its southern, or upper part, separated from the north, or lower part, by an intermediate space of six German miles; the former being surrounded by the principalities of Coburg, Altenburg, and Eisenach, with the territory of Erfurt; and the latter by the circle of Thuringia, the electorate of Saxony, and the counties of Stollberg, Hohenstein, Eichsfelde, and the territory of Mulhausen.

This principality has several beautiful and fertile parts, remarkably fruitful in all kinds of grain, esculent vegetables, and fruit; other places afford tolerable wine; and the forests of Thuringia and the Hartz are of considerable advantage to the country, from the great quantity of timber annually cut down and exported. These forests likewise abound in deer, wild boars, and other game; and the rivers and ponds yield a great variety of fish. There are here likewise mines of silver and copper, and in some places are dug a very beautiful red and white alabaster.

The principal rivers in the upper principality are the Schwartz, which issues out of the forest of Thuringia, beyond the castle of Schwartzburg, and at length falls into the Sala. The Ilm rises in the forest of Thuringia, as does also the Gera. In the lower principality are the following rivers: the Helme, which discharges itself into the Unstrut; the Wipper, which rises at Eichsfelde, and also falls into the Unstrut; and the Helbe, which discharges itself into the same river.

In the whole principality are twelve boroughs, ten market-towns, fifteen castles, and about a hundred thousand persons. The princely houses and their subjects are of the Lutheran religion.

The princes of Schwartzburg are invested by the emperor with the office of grand master of the horse to the empire, and they are also huntsmen of the empire; but this title is enjoyed by other German princes. Their full titles run thus: Princes of Schwartzburg, and of the four counts of the empire; counts of Hohenstein; lords of Arnstadt, Sonderhausen, Leutenberg, Lohra, and Clettenberg.

Their arms are quarterly per pale four transverse beams or, and azure, containing for Schwartzburgh a lion; for Arnstadt an eagle sable, in a field or; for Hohenstein chequée argent and gules; for Leutenberg a lion passant or. The middle shield is argent a stag gules, or sable, for Lohra; beneath it argent a pitch-fork, and a curry-comb gules, in token of the office of master of the horse. In the center of the whole, on a particular shield, is the imperial spread eagle, with the sceptre and monde, and on a small shield on its breast is the imperial crown, denoting that in the fourteenth century Gunther, count of Schwartzburg, was elected king of Germany.

In 1713 the two principal lines entered into a perpetual compact and union, by which the division of the princely house into that of Sonderhausen and Rudolstadt was confirmed, and the reigning princes of both lines were, in 1754, introduced to sit and vote in the college of princes.

Each reigning prince has an actual privy-council, and by the division of the Schwartzburg lands between the two ruling lines, each of them is to maintain two courts of regency; that is, the prince of Schwartzburg-Sonderhausen one at Sonderhausen, the other at Arnstadt; and the prince of Schwartzburg-Rudolstadt one at Rudolstadt, and another at Frankenhausen. Each has also its counsellors at law and regency, who are absolutely independent of each other, and only subordinate to their own prince; but, by agreement, appeals, though with some limitations, are carried from the Schwartzburg regencies at Sonderhausen and Frankenhausen, to the elector of Saxony's

Saxony's regency at Dresden, and those from the regency of Arnstadt to that of Saxe Weimar.

Each prince has likewise his colonel, captain, and lieutenants for the management of military affairs; and when the empire is engaged in a war, the house of Schwartzburg, together with the count of Reussen, furnishes a regiment of six companies, amounting to a thousand men.

The territories of Schwartzburg-Sonderhausen are divided into thirteen bailiwicks, the principal places in which are the following:

Arnstadt on the Gera, a river which a little above divides itself into two branches. This town has a handsome stone bridge of six arches over the river, and of late the buildings in the town, both public and private, are much improved. Here is likewise an antient residentiary castle, with a church, and near it a palace for the prince's dowager, erected in 1732, with three churches, a provincial school of eight classes, a regency, a consistory, and exchequer. On the Gera are erected some brass and iron-works, besides several mills; and near the town is a house for the making of saltpetre.

Sonderhausen is a town seated on the Wipper, which at this place is joined by the Beber. On an eminence without the town stands the palace, where the ruling prince of the house of Sonderhausen usually resides. The front of this palace is new, and besides many other fine apartments, splendidly furnished, is a most superb saloon called the Giant's-hall. The garden here is laid out in a most beautiful manner. In the armoury stands an image of Pustrich, one of the Wendish idols, cast in a black shining metal, and hollow within. The body, which is every where large, is towards the belly an ell and a quarter round, and capable of containing above a common pail of water. Its head is also of a disproportionate size, with a round hole instead of the mouth, and another on the crown. The right hand rests on the head, and the left in his lap; but the middle of the left arm is broken off, and the legs are mutilated. Sonderhausen is the seat of the regency, and has a consistory and a court of justice.

The territories of Schwartzburg-Rudolstadt are divided into fifteen districts; but some of them the prince of this family holds jointly with the count of Stollberg. The principal places belonging to the former are the two following:

Rudolstadt is seated on the Sala, and has near it a castle, which stands on an eminence, in which the princes of Schwartzburg-Rudolstadt usually reside. This castle was destroyed by fire in 1735, but has been since rebuilt. Here are held the regency, consistory, and exchequer courts; and in the town church is to be seen the burial-place of the princes. Here is also a superintendency, and a seminary of divines founded in 1745 by prince John Frederic, and in honour of him called *Fredericianum*.

Frankenhausen is seated on a branch of the Wipper, which passes through the town, and stands in a fine fertile country, on the side of a mountain that forms a part of the Hartz, and to the north separates its district from a tract called the Golden Vale; indeed the town is on all sides environed with woods and mountains. It has a regency, and among the public buildings are the prince's palace, in which is a chapel. There are also two churches within the town, and two more without the gates. The school is within the remains of a Cistercian nunnery. The salt-works of this place are some of the most antient and famous in all Germany, and so considerable, that the town owes its prosperity entirely to them. There are a great number of salt-houses: the salt is drawn up in leathern buckets by means of large wheels, which are turned by the river Wipper; and in the Upper Town stands a fort originally built for the protection of these works.

S E C T. XX.

Of the County of MANSFELD.

Its Situation, Produce, Rivers, Lakes, and principal Towns.

THE county of Mansfeld borders on the duchy of Magdeburg, and the principalities of Anhalt and

Halberstadt; and extends thirty-three miles in length, and fifteen in breadth.

It is in general very mountainous, yet affords not only pasturage, but good corn-land, and has large woods, chases, vineyards, and fisheries. There are here mines of a kind of a blackish glittering sort of slate, which when smelted, yields much copper and silver, a quintal of the best sort containing five pounds of pure copper; but a quintal of the worst yields only two pounds. From this copper a great deal of silver was formerly extracted, and a great number of dollars coined. This slate is also remarkable for having the impressions of various animals, especially of fishes, as herrings, perches, and pikes.

In this country are likewise two considerable lakes, which, though they stand near each other, and have even a communication, the water of the largest is quite salt, while that in the other is perfectly fresh and sweet. They both abound in fish, on which account the inhabitants of the villages along their banks subsist by fishing; and they also afford an inexhaustible number of snipes, wild geese, and other water fowl, some of which are shot and others taken by the net. The Sala is the northern boundary of this country, where it receives the Salze, which issues from the above salt lake, together with the Schlenze and other smaller streams. The other rivers are the Wipper, the Eine, and the Weite.

Part of this country is under the sovereignty of Saxony, and part subject to the king of Prussia, who enjoys the title of count of Mansfeld.

The number of towns in the whole county amounts to seven. The prevailing religion is that of Lutheranism, and there are sixty-six parochial villages; the clergy belonging to them are divided into eight deaneries, the administration of which and the several parishes is lodged in the general superintendent of the county.

The titles of the count of Mansfeld are, prince of the holy Roman empire, Mansfeld, and Fondi; noble lord of Heldrungen, Seeburg, and Schraplau; and lord of the lordships of Dobrzhisch, Neuhaus, and Arnstein.

The arms for Querfurt are argent party per fesse gules; for Mansfeld, six lozenges, disposed in two rows gules; for Arnstein, sable, an eagle displayed, with the bill, legs, and claws or; and for Heldrungen, azure, a lion rampant or, with a crown of the same, a tongue exerted gules, and a reversed tail, gules and argent chequée in a bend.

The principal towns in this county are those which follow:

Eisleben, the capital of the county, is seated in the fifty-first degree thirty-nine minutes north latitude, and in the eleventh degree fifty-six minutes east longitude. It is remarkable for the great number of its brew-houses, and for the copper-mines in its neighbourhood, which were formerly in such good condition, that between the towns of Eisleben and Mansfeld there were at least thirty smelting-houses, which generally produced above a thousand tons of copper in a year; and every ton contained near two hundred ounces of silver; and though at present several good shafts are overflowed with water, and the ore is neither so rich in copper, nor yields so much silver as formerly, yet these mines turn to good account. In the town is a castle, with three parish churches, a grammar-school, a mine-office, a consistory, a general superintendency, and about a thousand houses. It is very populous, and the center of all the trade and business of the whole county, every thing designed for sale being brought hither; whence its exports to the Hartz and into Thuringia are very considerable.

This place is famous for having given birth to Martin Luther, who also died here. Among other relics of that great reformer is shewn in the great church of St. Thomas, his pulpit, which, from the extreme veneration entertained for it, is only preached in three times a year; that is, on the anniversary of Luther's birth-day, the day in which he died, and the opening of the catechetical lectures. There is here also shewn the wooden bedstead on which Luther lay, which is here pretended to be of such extraordinary virtue, that whoever carries a bit of it about him will never be troubled with the head-ach, and a tooth-picker made of it infallibly secures a person from the tooth ach. "The Swedes, says Mr. Keyssler, who
"are

“are very fond of being thought the genuine sons of Luther, carried away as many pieces, said to be cut from this bedstead, and a table that belonged to Luther, as would have made several tables and bedsteads. As this afforded great satisfaction, so it yielded no small profit to those who shewed these relics; for a very small part of the gratuities they got on this occasion, was sufficient to buy such another lucrative bedstead.” Our impartiality would not permit our suppressing so extraordinary a circumstance, though we are sorry to find any of the followers of that reformer so weak and so wicked as to countenance such gross superstition, which every rational protestant must condemn, and which Luther himself, were he living, would censure with the utmost warmth and indignation.

The city of Mansfeld is situated five miles to the north-west of Eisleben, and is very small. Its castle, which is seated on a high rock, was formerly both a fortress and the residence of the counts of Mansfeld; but the forepart of it only remains, the rest, together with the walls and bastions, being blown up in the year 1674.

SECT. XXI.

Of the County of WERNIGERODE.

Its Situation, Extent, Produce, Rivers, Government, and principal Towns.

THE county of Wernigerode is situated partly on the Hartz, and borders on the principalities of Blankenburg, Brunswick, and Hildesheim; and is only about fifteen miles in length and ten in breadth.

One part of the country is mountainous, and the other level. The hills form a kind of amphitheatre, rising gradually behind each other. The most distinguished of these is Great Brocken, which some esteem the highest mountain in all Germany. No trees, or scarce any small shrubs, are to be found on its summit, which frequently remains covered with snow till Midsummer, and in some of the northern parts even longer. Out of this mountain issues the Ilse, with the Great and Little Bude, and also the Ecker. The mountains afford very valuable plants, with berries of all kinds, particularly cranberries, great quantities of which are preserved by the inhabitants. Oak and beech are less common here than firs and pines, though great care is taken in planting and keeping up the forests.

The plains are very fertile in all kinds of grain, pulse, turnips, flax, culinary herbs, fruit, and other vegetables. As the meadows and pastures are very rich, great numbers of cattle are bred here, and the country likewise abounds in all manner of beasts of chase and wild fowl.

This county also abounds in iron, lead, cobalt, free-stone, lime-stone, marl, and clay for bricks and pots.

The county is very populous, and the language of the inhabitants, who are of the Lutheran religion, is Low German. They export corn, oatmeal, all kinds of berries, timber, and brush-wood; as also deals, oil, fine oxen, venison, hogs, fish, chalk, saltpetre, gunpowder, cast and wrought iron, wrought copper, which is imported rough, paper, cloth, stuffs, and brandy.

This county is a fief of the king of Prussia, though a part of it belongs to the count of Stollberg. The king, as sovereign of the country, levies the excise in the town of Wernigerode, though one-tenth of it goes to the count. His majesty also taxes the country, and raises soldiers. Appeals lie from the count's regency to the revenue court at Berlin; and yet the count has the jurisdiction of the mines, chaces, stores, and coinage; as also in criminal, civil, and church affairs. His regency, to which appeals are brought from the inferior courts in the town and country, consists of a secretary, a director, and counsellors. These, with the addition of three ecclesiastical counsellors, form the consistory. The revenue court consists of a director, counsellors, assessors, and other officers, who, with the addition of forest and mine officers, form the forest and mine courts. The revenue of this county is computed at the annual sum of fifty thousand rixdollars.

The principal towns in this county are the following: Wernigerode is situated at a small distance from the Ecker, which receives into it a rivulet that runs through the town. It has a castle seated above the town on a mountain, which has been so greatly improved by count Christian Ernest, that it has not one waste spot. This castle he has adorned with a large and valuable library; and here likewise are kept the archives of the family. About this stately seat lies a park, which was walled in by the above count, and finely planted both with fruit and forest trees. In it, near the castle gate, is a row of houses for the count's domestics, together with a well-built orphan-house and new stables, with many single houses for the count's attendants. In the park is a summer-house called the hermitage, which stands higher than the castle itself. Near the park is a most beautiful parterre, with a fine green-house, in which is a large saloon; and just by is a magnificent palace, in which lives the countess Frederica Charlotte of Hohenlohe-Ingelfingen. A vista of limes leads from the park to the count's kitchen-garden and orchard, which lie near the town, and both the road and foot-way to the castle are planted with rows of trees.

The town itself consists of three parts, the Old and New Town, and the suburb of Noschenrode. In the Old Town are only four hundred and thirty houses, three churches, two alms houses, a palace belonging to the count, the offices belonging to the government, a Latin school of five classes, and several mansion houses belonging to the nobility. The New Town contains only about two hundred houses, a parish church, and an alms-house, while the suburb contains about one hundred and fifty houses, one church and a school.

Several great fires have happened here, particularly in the year 1751; but the greatest part of the houses have been rebuilt with stone.

To the corporation belong very large woods, out of which the burghers are allowed timber for building, with a certain quantity of wood for fuel. The trade of the townsmen chiefly consists in manufactures of cloth and woollen stuffs, brewing, distilling, and agriculture.

Drubec is a large and beautiful village, the inhabitants of which are esteemed the richest farmers in all the country, and are fond of being called the men of Drubec. At this place is an antient foundation, consisting of an abbess and five canoneses, who may be either of noble or trading families. To this foundation belongs a church, besides which there is another in the village.

Isenburg is a large open town, which was antiently walled. It has a castle seated on an eminence, which was formerly the residence of the counts of Stollburg, and near the castle is a large park, in which is the mansion-house of Leiningen, thus named from the consort of count Christian Ernest of the house of Leiningen. The chief trade of the place arises from the iron works and flatting mills belonging to the count.

SECT. XXII.

Of the Dutchy of MAGDEBURG.

Its Situation, Extent, Produce, and Rivers; the Religion of the Inhabitants; the several Offices of the Government; the Revenues of the Prince, and the principal Cities of this Dutchy.

WE now come to the circle of Lower Saxony, which is bounded on the north by the dutchy of Sleswic and the Baltic; on the east by the circle of Upper Saxony; on the south by the same circle, and a part of the circle of the Upper Rhine, and on the westward by the circle of Westphalia and the German ocean.

The states belonging to it are those of Magdeburg and Bremen, Zell, Grubenhagen, Calenberg, Wolfenbottle, Halberstadt, Mecklenburg-Schwerin, Mecklenburg-Gustrow, Holstein-Gluckstadt, Holstein-Gottorp, Hildesheim, Saxe-Lauenburg, the archbishopric of Lubec, Ratzeburg, Blankenburg, Ranzau, Lubec an imperial city, Goslar, Mulhausen, Nordhausen, and Hamburg.

We

We shall begin with the dutchy of Magdeburg, which is surrounded by the Mark of Brandenburg, the dutchy of Brunswic, the principalities of Halberstadt and Anhalt, the county of Mansfeld, and the electorate of Saxony, extending sixty miles from east to west; but its breadth is very unequal.

The country belonging to this dutchy is for the most part level. It has some good corn lands, and produces fine cattle; but several circles are sandy, marshy, and over-grown with woods. In some parts there are pit-coal, while in others fuel is scarce. The salt springs are here so rich, as to be able to supply all Germany with salt.

The Elbe passes through a considerable part of the country, and the river Havel forms its eastern boundaries between Brandenburg and this dutchy. Here rises the Aller, which discharges itself into the Elbe. The other rivers are the Saale, or Sala, which here receives the Elster, and afterwards discharges itself into the Elbe, the Ohre, and the Bode.

The established religion of the inhabitants is Lutheranism; but a great number of French and German Calvinists have settled here, and the popish religion is tolerated at Magdeburg and Hall. The Lutheran parishes amount to three hundred fourteen, and the pastors to three hundred and fifty-three. These parishes are divided into sixteen inspections, under the direction of as many inspectors, subordinate to a general superintendent. The German Calvinists are possessed of seven churches, and have eleven ministers; the French have six congregations, to five of which are ten ministers; but those at Calbe are subject to a German pastor; and at Hall is a synagogue of Jews.

Magdeburg contains manufactures of woollen cloth, linen, stuffs, stockings, oil-skin, leather, parchment; and particularly exports large quantities of starch, flour, and all sorts of grain.

In the diet of the empire the king of Prussia, as duke of Magdeburg, sits and votes between the elector of Bavaria and the elector Palatine.

The arms of the dutchy are party per pale, gules and argent.

The dutchy has its own regency, who in 1714, were removed from Hall to Magdeburg, and consist of two senates. The war and domain chamber manage all the concerns of the domain and finances, with the excise, contributions, &c. but each chest is kept separate, under its distinct office. In the towns the excise and other branches of the revenue are under the direction of persons styled tax counsellors. The consistory is composed of the members of the regency, the general superintendent, and some lay and ecclesiastical counsellors. Its power is limited to the Lutheran churches, while the Calvinists are subject to their supreme directory, and the French are under the direction of the French supreme consistory at Berlin.

The princes revenues arise chiefly from the domains, taxes, and military chest. In the domains are included the king's profits arising from the salt-works at Hall, and other places, with the duties on salt; the neat profit and tythes of mines, confiscations, fines, farms belonging to bailiwicks, navigation-farms, sluice money, tolls by land and water, forest rents, payments for mastage, and the like. Out of these taxes are paid the king's officers in the dutchy, the expences of the royal buildings, sluices, tillage, repairs of highways, and other disbursements. The surplus is paid into the general domain chest. The tax and military chest receive the country contributions, with the forage and subsistence money for the country cavalry, the excise laid upon goods consumed, the provincial excise, and other incomes, all which are afterwards paid into the general military chest, or remitted to the several regiments in the country for their subsistence. The contributions, and other revenues belonging to the tax chest, are collected in every circle by circular receivers, to whom they are remitted every month by the under receivers in the small towns and villages, of which every provincial counsellor has the controul in his respective circle. The

annual revenues of the sovereign from this dutchy, amount to above eight hundred thousand rixdollars.

The dutchy is divided into four circles, the most considerable places in which are,

The city of Magdeburg, which is the capital of the dutchy, the seat of the provincial regency, the consistory, the war and domain office, and one of the principal trading towns in all Germany, is seated on the Elbe in the fifty-second degree sixteen minutes latitude, and the twelfth degree nine minutes east longitude. It is strongly fortified, and has among other works a citadel, seated on an island in the river Elbe, which is joined to the city and the country by two bridges. The city is well built, particularly the broad street, which has a grand appearance; but the principal beauty of the town consists in its cathedral square, which is adorned with large elegant houses, and the area of it well paved. The Lutheran cathedral, dedicated to St. Maurice, is a superb structure in the antique taste; it is two hundred and eight German ells in length, and of the same height; its breadth is fifty-five ells, and the whole building, which consists entirely of free-stone, is richly adorned with sculpture, particularly there is a basso relievo of the wise and foolish virgins, a fine porphyry font, an altar in the choir of different kinds of marble, and in the front of the choir is a fine marble statue of St. Maurice.

Among the other public edifices are the king's palace, which was antiently the residence of the bishops, the armoury, the governor's house, and the guild-hall. Here is also a Lutheran convent, which was formerly a monastery of Premonstratensian monks, dedicated to Our Lady, and has a school or seminary. The Lutherans have also six parochial churches, and the Calvinists consist of three congregations, German, French, and Walloon. To the seminary, which belongs to the town, are ten professors, and the Calvinists have a Latin school. Here is also an alms-house, an hospital, and an orphan-house, all maintained at the king's expence.

In this town is a variety of manufactures, particularly of all sorts of woollen cloths and stuffs, half and whole silk stuffs, cottons, linen, stockings, leather gloves, black and yellow tobacco, roll tobacco, snuff, &c. The city is also remarkable for its large magazines of merchandize brought from Hamburg, on the Elbe, which is very rapid, in flat-bottomed boats, and from hence sent by land to Leipzig, and other parts. Indeed its situation on the Elbe, and its being on the road between Upper and Lower Germany, is of great advantage to its trade.

This city has frequently suffered by the ravages of war. Charles V. put it under the ban of the empire for rejecting the *Interim*, and charged Maurice elector of Saxony, with the execution of it, who after a siege which lasted from the sixteenth of September 1550, to the ninth of November 1551, took it by capitulation, in which it was stipulated, that the emperor should be reconciled, and the ban revoked. In 1629, it was blockaded by the Imperialists for the space of twenty weeks. But the most dreadful calamity of this kind, was in the year 1631, when the Imperialists under count Tilly besieging it in form, and taking it by storm, it was sacked and burnt, except the cathedral, some adjacent houses, and a few small cottages of fishermen; so that, according to some authors, sixteen churches and chapels, many of them covered with lead, and one with copper, were reduced to ashes. Tilly had the infernal barbarity to order his soldiers to spare neither age nor sex; and they too well obeyed the commands of their inhuman general, by ripping up women with child, murdering infants in the sight of their parents, and ravishing the helpless virgins in the very streets, while many of these, to escape violation, ran into the Elbe, and others into the fire; in short, the slaughter was so great, that though the number of the burghers was before computed to amount by the lowest computation to twenty thousand, not above four hundred escaped. In the beginning of the year 1632, the Imperialists withdrew, and the Swedes taking possession of the city, began to rebuild

rebuild it; but when it was reduced to some order, it was again blockaded in 1635, by the troops of Brandenburg and Weimar, and in 1636, besieged and taken by capitulation by the Imperialists and Saxons, on which the Swedish garrison withdrew.

The city of Hall is seated on the Saale or Sala, and contains a thousand and sixty-three houses that pay taxes, besides its public edifices; and the inhabitants of the town and suburbs are computed at thirteen or fourteen thousand, without including the students and the garrison. The town is divided into four parts, named the Maria, the Ulrich, the Nicholas, and Maurice quarters. Mauriceburg was antiently a castle; but the greatest part of it now lies in ruins; however, the chapel is in the possession of the French Calvinists. The Lutherans have three parish churches, and the German Calvinists have the cathedral and another church; the Papists are likewise permitted a chapel for the private exercise of their religion, and the Jews have a synagogue. The celebrated Frederician university was formed out of an academy of martial exercises. The public hall belonging to this last building is in the weigh-house, as is also its library, which consists of upwards of ten thousand volumes, and on the parade is an anatomical theatre. The nunnery for ladies was founded in 1702, for the reception of one abbess and nine ladies of the Calvinist religion, by Godfrey Zena, secretary to the regency of Magdeburg. The Calvinists are possessed of two hospitals, exclusive of an almshouse for the French Calvinists.

The vale of Hall, which consists of the lowest part of the town, and lies on the Saale, has four rich salt-springs, with ninety-six boiling houses. Besides the common trades, there are here carried on various manufactures, as those of fine brown and white leather gloves, worsted and silk stockings wove, flannel, frieze, light stuffs, fustian, printed flannel and linen, tobacco-pipes, porcelain, great quantities of starch, powder, gold, silver, and silk ribbons after French and other patterns, and beautiful red and yellow Turkey leather.

Close to the north side of Hall is the town of Neu-markt, which seems one of its suburbs, though in reality it is not. It consists of about two hundred eighty-three houses, has its own magistrate, a parish church, and a small school.

Glauche, another town, lies also so near the walls as to seem a suburb to the city, and contains about three hundred and thirteen houses, with several vineyards: it has its own magistrates, and contains one parish church, with a school. But the most remarkable public buildings here are the orphan-house, which is esteemed one of the most noble and useful foundations in all the Prussian dominions, with the royal pædagogium, and the widows-house. In the above orphan-house is a valuable dispensatory, a laboratory, and a considerable trade is carried on in books. To the orphan-house also belongs a spacious library, a museum, and an excellent printing-office, the latter founded by the baron Canstein, in which the whole Bible, the New Testament, and Psalter are always kept standing; and these books, of all sizes, are sold at this printing-office at very low prices.

SECT. XXIII.

Of MECKLENBURG.

Its Situation, Extent, Produce, and Rivers. The Religion of the Inhabitants, their Trades, Exports, Government, the Divisions of the Country, and the Places most worthy of Notice.

MECKLENBURG is bounded on the north by the Baltic; on the east by Pomerania; on the south by Brandenburg; and on the west by the diocese of Lubeck, the principality of Lunenburg, and also by Lauenburg and Ratzburg: but geographers differ greatly in their accounts of its extent; which is, however, about a hundred and thirty miles in length from east to west, and in some places eighty in breadth from north to south.

With respect to the nature and goodness of the country, the Mecklenburghers themselves disagree. It, however, contains many large and small lakes from four to ten miles in length, and from four to seven in breadth. There are here likewise some large and desolate heaths, moors, and fens; a great part of the country consists of a sandy soil, but, according to Cluverius, the very worst of these sandy tracts produces excellent rye; when they lie fallow there cannot be better sheep-walks; and when they are well tilled and dunged, they yield wheat and barley. The country is interspersed with delightful eminences; pleasant and profitable woods. Several fens have been drained and improved into arable and pasture land. The commons and meadows are in most parts not at all inferior to those of Holstein and Pomerania; and grazing is so considerable, that the inhabitants export some thousands of cattle. Indeed, it must be acknowledged, that by art and labour the face of the country is capable of being greatly improved; for the marquise of Brandenburg, which lies contiguous, and bears a great resemblance to this country, shews that their marshy and sandy wastes may be converted into a fertile and pleasant country. The lakes and rivers abound in fish, more particularly in eels and craw-fish. The country has also some salt springs, with mines of copper, iron, and allum.

With respect to the rivers of Mecklenburg: the Elbe washes the borders of this country to the south-west, where it is joined by the Elde, which here issues from the lake of Plauer; and into that river flows also the Stor, which proceeds from the lake of Schwerin. The Reckenitz rises in this country, and forms the limits between Mecklenburg and Pomerania, after which it discharges itself into the Baltic. The Tollense issues out of the lake of the same name, and joins the Pena. The Warno rises in the center of this country, and, after receiving the Milnitz and Nebel, forms a lake and harbour at Rostoc, and falls into the Baltic. The Radegast rises at Stellingen, and having run by several towns, is called the Stopenitz, under which name it crosses the lake of Dessau; and having united its stream with the Drave, discharges itself into the Baltic. The Havel flows from the lake of Barn, and flows into the mark of Brandenburg.

Mecklenburg has only one harbour on the Baltic, which is that of Rostoc; but it would be easy to make another at Neu-Bucko, and a third at Ribnitz, the advantages attending which would abundantly over-balance the expence.

This country is divided into two dutchies, and the inhabitants of both are Lutherans, whose churches and schools are here divided into six rural superintendencies, and under the superintendents are provosts. There are also some congregations of Calvinists, and in Schwerin the papists are permitted the private exercise of their worship.

The country has woollen manufactures, tanners, leather-dressers, and people of other trades; but their number is not sufficient to supply the country. The exports of the inhabitants consist of cattle, butter, cheese, corn, flax, hemp, hops, several kinds of wood, and also honey and wax. In both dutchies are forty-five great and small cities, three convents belonging to the nobility and states of the country, and five hundred and ninety-four manors. In the year 1628 the number of farms belonging to the sovereign were one thousand and one, those of the nobility amounted to seven hundred and twenty-seven, and those of the convent to seven hundred and sixty-eight.

The peasants are under villenage, but the nobility are free, and enjoy very considerable privileges.

The states are composed of the nobility and towns. In 1523, the nobility and commons of the two dutchies of Schwerin and Guffro entered into an indissoluble compact of union, which has been acknowledged and confirmed by the sovereigns, and consists both in a conjunction of the provinces, and in that of the states of which each is composed; it being agreed, that all the free inhabitants of both dutchies, including the whole of the Stargard circle, should enjoy an equality in rights, privileges, and immunities; be governed by the same laws,

laws, and in all cases and exigencies should daily aid and assist each other in council and action.

The government of the whole country of Mecklenburg was formerly under one prince; but duke John, who died in 1592, leaving two sons, Adolphus Frederic and John Albert II. they divided the country between them, by which the former obtained the part belonging to Schwerin, and the latter that belonging to Gustro; while the town of Rostoc, with its university and hospital, and the monastic lands, remained in common: but the line of Gustro becoming extinct in 1695, duke Frederic William of the Schwerin branch laid claim to the sole inheritance of that dutchy, but was opposed by Adolphus Frederic, duke of Strelitz, his father's younger brother. However, this contest was decided at Hamburg in 1701, by an agreement that the principality of Gustro should be added to that of Schwerin, and that duke Adolphus Frederic, besides his dutchy of Strelitz, should also hold the principality of Ratzeburg, with the lordship of Stargard, the antient commandaries of Miro and Nemero, and a yearly pension of nine thousand dollars. At the same time the right of primogeniture and the lineal succession were established in both houses, and the agreement ratified by the emperor. These two lines of the dukes of Mecklenburgh still subsist, and her present majesty, Charlotte queen consort of Great Britain, is the sister of Adolphus IV. the present duke of Mecklenburg Strelitz.

The titles assumed by both the dukes, are duke of Mecklenburg; prince of Wenden, Schwerin, and Ratzeburg; count of Schwerin and the county of Rostoc; and lord of Stargard.

Their arms are party per pale two bends divided into six fields. The first is or, a buffaloe's head gardant gules, crowned with horns argent, with a ring of the same through its nostrils, for Mecklenburg. The second is azure, a griffin or, for Wenden. The third party per fesse barry of two azure, with a griffin argent, and a lozenge purpure. Both these are said to be the arms of Rostoc. The fourth is gules, a cross wavy argent, for the principality of Ratzeburg. The fifth gules, an arm cloathed argent, and bound with a ribbon of the same, issuing from a cloud, and holding up a ring or, with a stone infixed, for the lordship of Stargard. The sixth is or, a buffaloe's head sable, with a crown or, and horns argent, panting and placed oblique. There is also an escutcheon, party per fesse, gules and or, for the county of Schwerin. The electors and margraves of Brandenburg likewise use the title and arms, because, on the extinction of the male stem of the dukes of Mecklenburg, that dutchy falls to the house of Brandenburg.

The annual revenues of the Schwerin line amount to three hundred thousand rixdollars per annum, and those of the duke of Mecklenburg Strelitz to about a hundred and twenty-six thousand. No payment is required for the maintenance of the duke's troops, either of the nobility or states, the duke defraying all the expence of the military establishment out of the fixed annual contributions. The nobility and their vassals are also exempted from quartering and maintaining the militia, as the municipal towns are from quartering the horse. The towns, however, quarter the foot, and pay service-money.

The two dutchies are divided into three circles, that of Mecklenburg, that of Wenden, and the circle of Stargard.

The Mecklenburg circle forms the dutchy of Schwerin, which consists of the antient dutchy of Mecklenburg, the county of Schwerin, the western part of the principality of Wenden, and a small part of the lordship of Rostoc; the principal places in which are the two following towns:

Parchim, the capital of this circle, is seated on the river Elde, which here divides itself into two branches, and in several parts run east and west through the town, which, though it has the name of a capital, is very inconsiderable, and has only two parish churches.

Schwerin, the usual residence of the dukes of that line, is situated on a pleasant lake that abounds in a variety of fish, and, besides surrounding the greatest part of the town, originally gave name to it. This town is nearly square, and consists of three parts, which are named Schwerin, the New Town, and the Moor. The duke's palace stands on an island in the lake, where it is defended by fortifications, and has a communication with the town by means of a bridge. Some parts of it command a most delightful prospect. The paintings in this palace are very valuable, and the gardens are laid out in a fine taste. The town has frequently suffered by dreadful fires.

The circle of Wenden contains the eastern, and greatest part of the principality of Wenden, with the lordship of Rostoc, and the largest part of the dutchy of Gustro.

Gustro, the capital of the circle of Wenden, is seated on the little river Nebel, thirty-five miles to the north-east of Schwerin, and is one of the largest and most pleasant cities in the whole country, as also the seat of the chief courts of judicature and a superintendency. In this town is a good palace belonging to the prince, with a most elegant garden; and in the church of this palace is the vault of the ducal family. Gustro likewise contains a cathedral, and a parish church.

Rostoc, a free imperial city, and the largest in both dutchies, is seated on the Warna, at the mouth of which it has an harbour, and stands twelve miles to the north-west of Gustro. It has fourteen wide and long streets, besides smaller, and many thousand handsome houses. It properly consists of three parts: the Old, New, and Middle Towns. The first stands on an eminence towards the east, and contains the churches of St. Catharine, St. Peter, and St. Nicholas; the two last of which are parochial. In 1677 most of this part was destroyed by fire, but has been since rebuilt with greater regularity. The Middle Town is separated from the former by a branch of the Warna, and contains St. Mary's church, a stately structure, in which are preserved the entrails of the celebrated Grotius, who died here in 1645. Here is also the church of St. John, a library, and the council-house. In the New Town is St. James's church, which was formerly collegiate; the church of St. Michael, and that of the Holy Cross, which has a convent for young ladies, natives of Rostoc. In this part is also the university, which has twenty-four professors, to whom the dukes annually pay the sum of three thousand florins, and the town five hundred, towards their salaries. Here is also a public free-school.

Among the peculiarities belonging to this city, the inhabitants are said to boast of their having seven gates, seven large streets that center in the great market, seven bridges over the Warna, seven doors to St. Mary's church, seven towers to the town-hall, seven great bells belonging to the town clocks, which chime at certain hours, and seven vast lime-trees in their common garden.

The magistracy consists of three burgomasters, one syndic, twelve aldermen, one secretary, and a prothonotary. This city has a mint, and the right of coining gold, silver, and copper. Both the civil and criminal jurisdiction are vested in the magistracy, though with right of appeal to the two supreme courts of justice. This city is seated in the fifty-fourth degree twenty-six minutes north latitude, and in the twelfth degree eighteen minutes east longitude; and carries on a considerable trade.

Wismar, a town seated on a bay of the Baltic, formerly belonged to the dutchy of Schwerin, but at the peace of Westphalia was ceded to the crown of Sweden. It has a good harbour, and is one of the best and largest towns in these countries; for it has six churches, a particular consistory, a grammar-school under the direction of eight masters, and is likewise the seat of a Swedish court of justice. It was formerly a Hanse town, and had the privilege of coining money. This town has been frequently taken and retaken.

S E C T. XXIV.

Of the Dutchy of HOLSTEIN.

Its Situation, Extent, the Face of the Country, and its Produce. The Religion, Trade, and Commerce of the Inhabitants. Of the Dukes of Holstein, their Titles, Arms, and Order of Knighthood: their Revenues, Courts of Justice, and principal Towns; with a particular Description of the free Cities of Hamburgh, Altena, and Lubec.

THE dutchy of Holstein is bounded towards the north by the dutchy of Sleswic and the Baltic, which is also its eastern boundary; towards the south by the dutchy of Lauenburg, the territories of Lubec and Hamburg; and on the west by the Elbe, which separates it from the dutchy of Bremen, and by the German ocean. Its extent from east to west is about ninety miles, and from north to south about sixty.

Its situation between the Baltic and German ocean exposes it to frequent storms, which indeed purify the air, but oblige the inhabitants to be at great expence to secure themselves from inundations, by raising lofty and strong dykes, and keeping them in constant repair. The districts where these dykes are necessary being in the low lands near the German ocean, and the mouth of the Elbe, they consist of excellent marshes that produce wheat, barley, peas, beans, and particularly rape-seed; and also afford a fine breed of cattle, that are much larger and stronger than those in the champaign country; and, besides the native cattle, a great number of heifers are brought here to be fattened. The middle part of the country indeed mostly consists of sand and heath, yet affords good pasture for sheep. In these parts the fern is mowed, and in winter is strewed in the cow-houses. The districts which border on the Baltic, and consist of champaign land, are very fruitful. The beef, veal, mutton, and lamb, are very fat and palatable. The breed of horses is on the decline, but this country still affords some that are very beautiful, and are sold for two or three hundred rixdollars. Holstein likewise abounds in poultry, wild-fowl, and game of all kinds.

The German ocean, with the Baltic, the rivers, the lakes and ponds, furnish the inhabitants with great plenty of a variety of fish. In this country are fish-ponds of a very singular nature, which for two or three years abound with pike, carp, lampreys, and perch; but every third or fourth year are drained, and the fish sold; after which the pond is for some years sown with oats, or used as pasture land, and then again laid under water and stocked with fish. This is said to be a most lucrative piece of oeconomy.

Here are no hills that deserve the name. The principal inland rivers are the Eyder, the Stor, and the Trave, the last of which, among other streams, receives into it the Pennau, the Schivenstin, and the Schwartau.

The inhabitants are generally fair, handsome, strong and brave, and so just and true to their words and promises, that in the neighbouring parts of Germany the Holstein faith is become proverbial. They are fond of good cheer, and the great affect a splendid equipage and retinue.

The established religion is Lutheranism, and the churches are under the inspection of provosts, subordinate to the general superintendents who preside over the king's share in the dutchies of Sleswic and Holstein, and over those of the prince within his part of the latter; and these churches are visited every year by the superintendent of the ruling prince. At Gluckstadt and Altena are churches belonging both to the Calvinists and Papists, and at the latter, among other sects, the Menonites are possessed of two churches. At Kiel is a Greek chapel for the Russians, and at Altena, Rendburg, Kiel, and Gluckstadt, the Jews are likewise permitted the exercise of their religion.

This country has several manufactures, particularly in the towns of Altena and Gluckstadt, but these might be greatly enlarged. Its advantageous situation for commerce, from its bordering on the Baltic sea and the German ocean, and its having the advantage of navigable

rivers, are not properly improved. Its exports are grain, malt, groats, starch, buck-wheat, peas, beans, rape-seed, horned cattle, sheep, swine, horses, venison, poultry, cheese, butter and fish.

This country is divided between the duke of Holstein Gottorp and the king of Denmark. Duke Adolphus, second son to Frederic I. was the founder of the Gottorp line, by bequeathing his share in the dutchies of Sleswick and Holstein to his sons, of whom only the third duke John Adolphus had issue. This prince introduced the right of primogenitureship, and dying in 1616, his son duke Frederic III. had for his successor duke Christian Albert, who was also succeeded by his son duke Frederic IV. whose son Charles Frederic in a second marriage espoused Anne the eldest daughter of Peter I. emperor of Russia; but was soon after dispossessed of all his territories. This prince dying in 1739, his son duke Charles Peter was in 1743 declared great duke of Russia, on which he assumed the name of Peter Feodorowicz, and in July 1762, ascended the throne of Russia; but was soon after deposed by his wife, and this was presently followed by his death, when his young son, who was born in 1754, was declared great duke of Russia, and also duke of Holstein-Gottorp, of which country prince Frederic Augustus of Holstein-Gottorp is appointed administrator during the young duke's minority.

The king of Denmark, on account of his share in this country, styles himself duke of Holstein, Stormar, and Ditmarsh; and all the dukes of Holstein and Sleswick style themselves heirs of Norway, dukes of Sleswic, Holstein, Stormar, and Ditmarsh, and counts of Oldenburg and Delmenhorst.

The arms of the duke of Holstein consist of five fields, and an escutcheon. The first of these is a lion crowned or, holding in his paws a bent halbert argent, for Norway. The second or, two lions passant azure, for Sleswick. The third gules, a nettle-leaf expanded and divided into three parts argent, with an escutcheon party per bend gules and argent, having round it three nails argent, placed between the three parts of the nettle-leaf, for Holstein. The fourth is gules, a swan argent, crowned or about the neck, for Stormar. The fifth is azure, a horseman armed or, with his sword drawn, and a horse argent, caparisoned sable, for Ditmarsh. The escutcheon is quarterly, the first and fourth or, barry gules, for Oldenburg; and the third and fourth, a cross wavy or, for Dolmenherst.

Holstein has an order of knighthood called that of St. Anne, which was founded in 1735, by duke Charles Frederic. The ensign of this order is a red cross enamelled, on the right side of which is the word ANNE written in a cypher, and on the left the letters A. I. P. F. also in a cypher, which are explained by the subscription: *Amantibus Justitiam, Pietatem, Fidem.* This cross is worn pendant at a red ribbon edged with yellow, sloping from the left shoulder down to the right side.

The king of Denmark from his share in the dutchy of Holstein, enjoys both a seat and voice in the college of the princes of the empire, and his vote is called that of Holstein Gluckstadt. The grand duke of Russia has also his seat and voice in the same college, which is called that of Holstein-Gottorp. Both under the same titles also sit and vote in the circle of Lower Saxony, and together with Meckenburg present, in their turn, an assessor for this circle in the aulic chamber.

The principal revenues of the sovereigns arise from their domains, and several imposts on their subjects, as the contribution, which is a kind of land-tax, paid monthly by the towns, manors, bailiwicks, and convents, according to the quantity of lands they possess; which alone annually brings into the military chest of each sovereign a hundred thousand rixdollars; stamped paper, toll on horses, black cattle, the fishery, &c.

As to the military force kept up in this country, the king of Denmark usually keeps here some regiments of foot, and one of horse. With respect to the duke's military force it amounts, according to Mr. Busching, to only about eight hundred men.

The king of Denmark appoints a stadtholder over his part of Holstein, and every sovereign has his colleges of state.

state. At Gluckstadt is held the king's regency-office, which is composed of the stadtholder, who is always president, a chancellor, a vice-chancellor, five counsellors that have salaries, and three secretaries, one of whom is always keeper of the records: this court is held four times a year. The other courts are,

The supreme bailiwick court, which on the rising of the chancery court, is held by the members of the regency office. This court receives appeals from the lower bailiwick courts; but from these superior courts no appeal lies, except to the king. Ever since the year 1754, the regency court has had the supreme authority in the trial of criminals.

With respect to inferior courts, the several causes in the towns are tried by the magistracy, from whose sentences appeals lie to the court of regency. Every town has likewise a petty court of its own, that takes cognizance of criminal causes, defamatory words, small debts, and the like, and from these an appeal lies to the magistracy.

It is remarkable, that the nobility and convents in the dutchy of Holstein, with their tenants, are subject to a joint government, to which every Michaelmas the king and duke alternately succeed. The person in whom the directory is lodged, after previous notification to the other sovereign's office of regency, issues forth orders and citations to the provincial court in both their names; but always gives precedence to the king's. The law affairs of the subjects are usually carried first before the joint Quartal court, which is held six weeks before the session of the provincial court, and is, as it were, a preparative to the next provincial court, for the greater dispatch of affairs which are brought to it, when thought necessary, by letters patent under the seals of both sovereigns. This court is alternately held at Kiel and Gluckstadt, the directory is under the ruling sovereign for the current year. The court is composed of four of the king's counsellors, and the like number of the princes, who must all be nobles, also of four men of letters for each sovereign, assisted by a chancellor, who is alternately appointed by the sovereign. Its other members are a secretary from each prince. In this court the causes of the prelates, nobility, and pastors in the churches of the nobility, have their first hearing, and hither likewise are brought all appeals from the courts of the nobility and convents.

We shall now proceed to describe, first, the principal places in the king of Denmark's share in the dutchy of Holstein.

We shall begin with Gluckstadt, called in Latin Ty-chopolis, a town and fortress situated in the district of Stormar, on the Elbe, which here receives into it a small river, called the Rhein. This town is regular and well built; and the market-place opens into the main streets. This town was built in the year 1620, on a waste ground called the Wilderness, by the permission of Christian IV. who in the patent, gave orders that it should be named Gluckstadt, or the Fortunate Town, conferring on it at the same time many privileges. The adjacent country being hollow and marshy, a stone causeway of near four miles in length has been carried along it, and on the land-side the town may be easily laid under water. It has a harbour, adjoining to which is a basin for the reception of vessels; but there being no springs here, the greatest part of the houses have cisterns for the receiving of rain; and those which are without such conveniences, are obliged to use the harbour water, or that of the new moat. Here is the seat of the king's regency, and the offices and courts connected with it. Both the palace congregation and the garrison frequent the town church; the Calvinists have a church of their own, the Papists a chapel, and the Jews a synagogue. The town has several times been besieged, but has never been taken.

Itzehoa, an antient and handsome town, seated on the river Stor, and divided into the Old and New, the latter of which is partly surrounded by the main stream of the Stor, and partly by a canal drawn from it, which separates it from the Old Town. In this part is St. Laurence's church, which is a stately edifice, and near it a convent for ladies of noble birth. Here is also an

alms-house, which has a chapel. In the New Town is St. Nicholas's chapel, the town-house, and a Latin free school.

Rendsburg, a fortified town on the river Eyder, seated on the confines of Germany. It consists of three parts. The Old Town stands on an island in the Eyder, and it was formerly contested whether this island belonged to the dutchy of Sleswic, or to Holstein. The town consists of six hundred houses, and is generally well gar-risoned. In it is the royal armoury, the carriage-house, and the granary, which are large buildings. It has two parish churches, one in the Old Town near a Latin free school, and the other in the New Town. It has its own consistory, and is the seat of the king's general superintendents over Holstein and the bailiwick of Rendsburg. It has a commercial college, established here in 1738 by Christian VI.

Ploen is a town almost environed by a great and small lake: it is divided into the Old and New, the last of which belongs to the bailiwick of Ploen, and in the former is a parish church and a Latin school. Without the Lubec gate is a suburb. The ducal palace here, which was rebuilt by duke Joachim Ernest, stands high, and commands a beautiful prospect. To the westward of this palace, and adjoining to the stable, a garden has lately been laid out, with a park, at the end of which is an hydraulic machine for the conveyance of water to the palace. On one side of it is a spacious kitchen garden, and in an island farther up the lake is a delightful pleasure garden. This town has been four times entirely destroyed by fire.

The duke of Holstein Gottorp's part of this dutchy is about half as large as that which belongs to the king, and brings in a revenue of two hundred thousand rix-dollars.

The principal town in this territory is,

Kiel, the capital of that part of Holstein, subject to the duke, which is situated on a bay of the Baltic, and has a convenient harbour. It is well built, and contains the prince's palace and the state colleges. Besides the town church here is one belonging to the palace, with a convent church, and a chapel at the farther end of the suburbs. It has also an university, founded in 1665 by duke Christian Albert.

We shall now give a particular description of those cities of Holstein which are neither subject to the king of Denmark nor to the duke of Holstein Gottorp, and shall begin with Hamburg, which was formerly the metropolis of all Holstein, till it became a free imperial city. It is seated on the north side of the river Elbe, which there forms a commodious harbour, in the fifty-third degree sixteen minutes north latitude, and in the tenth degree thirty-eight minutes east longitude from London. It is seated partly on islands, and partly on the continent, and has a territory that extends twelve miles round, in which are several large villages and fine seats. Its streets are for the most part pretty spacious, and some of them make a grand appearance; but several are very narrow, and there are many lanes. The houses, which are built with brick, are very high, and those in the broad streets make a handsome appearance. This is the second of the Hanse towns, and one of the principal among them. It is not only naturally strong, but is as well fortified by art as a place of its magnitude can well admit of. It is nearly circular, and five or six miles in circumference. The walls and other fortifications that lie open to view, are planted with rows of very high trees, so that on that side of the walls next Altena, none of the houses can be seen. It has six gates, and three entrances by water, namely, two from the Elbe, and one from the Alster. The wall is defended by twenty-three bulwarks, besides other outworks, and a very deep ditch. A noble line with other works run from the largest basin of the Alster to the Elbe, about half a mile above the town; and on the other side of the basin below the town, is the Star-sconce, a fortification so strong, that in 1686, the king of Denmark with all his army could not take it, after a six weeks siege.

The number of houses in Hamburg are said to amount to about thirty thousand, and it has six large market-places. The churches are antient, large, and handsome

structures;

structures; but are open thoroughfares all day long, and in some of them are booksellers shops. Here are six lofty steeples, some of which are covered with copper, though the frames are only of timber. The great spire of St. Peter is the highest, that of St. Michael's is four hundred feet high. St. Nicholas's is supported by large gilt globes. St. Catharine's has a noble front, adorned with statues in niches, and the steeple is formed of several lanterns diminishing to the last, which supports a spire like that of St. Bride's in Fleet-street, London; but is much taller: round the middle of this steeple is a gilt crown, and its organ, which is said to be the best in Europe, has six thousand pipes. The spire of the cathedral, with the tower on which it is supported, are near three hundred and sixty feet high; and though it is secularized, it has a dean and chapter, who with the cathedral and several houses belonging to it, are under the immediate protection of his Britannic majesty, as duke of Bremen. Besides these there are five other very large churches, and eight chapels of ease.

Hamburg has an university, well endowed and furnished with six professors. The senate-house and town-hall form an antient, large, and noble structure. The exchange, which is built opposite to it, is a fine building, but inferior to that in London. The British resident and company have a handsome hall. The emperor and several princes of Germany have their own post-houses; but that for England and Holland is the only one that can be said to belong to the public. Here is also an opera house, chiefly for the residents and other foreigners, of whom there are some from most of the trading kingdoms in Europe. This city is celebrated for its care of the poor; for they have here an hospital for orphans which has a revenue of between fifty and sixty thousand pounds a year: they have sometimes above three hundred infants abroad at nurse, who, when able to dress themselves, are taken into the house: the boys, if they shew extraordinary abilities, are maintained at the university, the rest are put out to trades; and the girls, after they can read, spin, knit, &c. are sent to service. There are also a large hospital for poor travellers that fall sick, and another for the relief of maimed, antient, and decayed seamen, where care is also taken of the widows and children of those who lose their lives in the service of the public. In another about a hundred and fourteen poor, old, blind, and dumb people are maintained. There is likewise St. Job's for the venereal disease; and a pest-house. Besides these hospitals there are many smaller for poor widowers, widows, orphans, &c. and a great number of free schools; with two work-houses, where rugs and coarse kerseys are manufactured, with which those confined are clothed. In one of them, such as have not performed their task are hoisted up in a basket over a table in the hall while the rest are at dinner, that they may be tantalized with the sight and smell of what they must not taste. Here are likewise societies for making good losses by fire.

Hamburg, from its situation, has all possible advantages for foreign and domestic trade, and therefore merchants from all the trading nations in Europe resort thither, and their goods are sent up the Elbe into the heart of Germany: the ships come up to their doors to lade and unlade, and this city has such advantages from its port, its rivers, and canals, that can no where be exceeded in Europe; for, besides the Elbe, which enters the German ocean below the town, a canal is opened into the river Trave, for the sake of a communication with Lubec and the Baltic sea, without going round the coast of Jutland, and the difficulties and expence which attend passing the Sound. Hence its trade is very considerable; for the Elbe, and the many navigable rivers that fall into it, after taking their course through some of the richest and most trading parts in Germany, furnish this city with the produce and manufactures of Austria, Bohemia, and Upper and Lower Saxony. By the Havel and Spree it trades with the electorate of Brandenburg; and by a canal from the Spree to the Oder, its commerce is extended into Silesia, Moravia, Poland, and almost to Hungary.

The principal merchandize exported from Hamburg, especially to Great Britain, are linen of several countries, great quantities of linen yarn, tin plates, brass, steel,

and iron, wire, corn, kid-skins, pipe-staves, clap-boards, and other timber.

The chief articles which the Hamburgers import from abroad are woollen manufactures from England, the value of which from Yorkshire alone, and generally shipped from Hull, is computed to amount to above a hundred thousand pounds a year; with English stockings, and other goods, amounting to a very great sum. The English merchants make a very extraordinary figure here; they form a body that has several privileges, and have a church and minister of their own. The Hamburgers also trade very considerably into Livonia and Russia; and for the goods they send into the north part of the empire, and into Poland, they have a return in linen yarn, fine flax, honey, wax, aniseed, linseed, oil, drugs, &c.

Above two hundred English ships enter this harbour every year, and a great number come from Spain, Portugal, and Italy. This city has a great share in the Greenland whale-fishery, having commonly fifty or sixty ships employed in this trade, whence they are able to export great quantities of oil and whale-bone; but from their great trade upon the Elbe they are obliged to buy more of these articles from the Dutch, than their own ships can supply them with. In time of war they fit out ships of force to convoy their merchantmen; and they are strong at land as well as sea, they having a constant garrison of near two thousand men, and being able to arm twelve or fourteen thousand.

Besides the beer brewed here, great quantities of which are exported, they have erected several manufactures, particularly weaving of damasks, brocades, velvets, and other rich silks, calico-printing, and sugar-baking.

The government of this city is vested in the senate and three colleges of burghers, and is a mixture of the aristocratical and democratical form: the principal persons of the republic are vested with almost every act of sovereignty, while the management of the finances is solely entrusted to the burghers. They are governed by their own magistrates, have no seat or vote in the general diet of the empire, and are only subject to the general laws of the Germanic body. They are, however, under the protection of the emperor, to whom they pay annually eighty thousand crowns.

The common prison in this city for malefactors is in the hangman's house. After sentence is pronounced, which is always on Friday, and the execution on the Monday following, they are carried not to a dungeon, but to a handsome upper room, where they are allowed a good bed, with all reasonable comforts suitable to their condition, and are constantly attended by one of the city clergymen, a duty which they are all obliged to perform by rotation. As no criminal can be put to death without his pleading guilty, they have five degrees of torture in order to extort a confession, and these are applied one after another in proportion to the strength of the evidence in support of the charge or accusation. The degree of the torture is lodged in the breast of the judges, who are always present with a clerk in order to take down the confession, at a table with a curtain drawn round it; so that they can hear and speak to the poor tortured wretch without being eye-witnesses of the cruelty, and can either relax or increase the torture according to the strength and other circumstances of the sufferer. It will not be improper here to observe, that among the several convents of this city, all of which have been secularized and are now Lutheran, one of them is obliged by its foundation to offer a glass of wine to every malefactor that is carried by it to execution.

Few or no beggars are to be seen in the streets of this city, which is partly owing to their being picked up by the beadles, who have a reward for it, and carry them to the house of correction, and partly to the manufacture of knit stockings, worsted being carried by the parish officers to the habitations of the poor, and also wool to be carded and spun; these fetch their work from thence every Saturday, and pay them what they have earned. A curious piece of work here intitles an artificer to the freedom of his company, a benefit that can no otherwise be obtained but either by servitude, by marrying a freeman's widow or daughter, or else at a very great expence.

The merchants of Hamburg are courteous, but too ceremonious and full of compliments; and though very frugal in their own houses, yet are extremely liberal when they treat strangers. They are fond of having gardens at the city gates. Coaches here are very numerous, though the crookedness and narrowness of many of the streets renders them inconvenient, and there is hardly a merchant or even considerable shop-keeper without one. The hackney-coaches are also very numerous. The common carts are only a long pulley to a sort of truckle upon an axle-tree, between two wheels, drawn not by horses, but by a dozen or more men, who are linked to these machines with slings across their shoulders, and drag along a weight of two tons.

Among the other peculiarities, the ladies are attended to church not by a footman, but by a servant-maid, with a book hanging by a silver chain upon one arm, and, if the weather be very cold, with a brass stove upon the other.

Both strangers and natives of the best fashion spend their time at an odd kind of tavern kept in a cellar, or vault, which has a prodigious stock and a great vent for old hock, &c. and brings in a considerable revenue to the state, it being under the management of a deputy, put in by a select number of the magistrates.

Altena is a considerable town seated in a most delightful country on a high shore of the Elbe, not above a cannon-shot to the west of Hamburg. It contains about three thousand houses, and upwards of thirty thousand inhabitants, with two Lutheran churches, and the same number for the German and Danish Calvinists, with a fifth for the French Calvinists, a sixth for the Papists, and two Menonite churches, besides those belonging to other sects, who are allowed the free exercise of their religion: the Jews are also very numerous, and have a large synagogue, but pay two thousand ducats a year as protection-money. Here is a royal seminary, to which the town-school is united, an orphan and poor-house, and an anatomical theatre, with three docks for the building of ships. Among its ornaments is the mall, which, being planted with four rows of trees, forms an agreeable walk. This town has a variety of manufactures, and its trade is far from being inconsiderable.

The origin of its name is thus accounted for: deputies from Hamburg, in a remonstrance to the king of Denmark against building it too near their city, frequently made use of the words *Dat is all te nae*, or That is too near; the king taking particular notice of the three last monosyllables, said banteringly to the deputies, he could not excuse himself from going on building it; but that to oblige them he would call it by the name they had given it. This town is famous for the calamities it suffered in 1712, when count Steinbock, the Swedish general, after defeating the king of Denmark, appeared before Altena, and sending a message to advise the inhabitants to retire with such of their effects as they could carry off, the magistrates came out in a body, and falling at his feet, offered him fifty thousand rixdollars to spare the town. Steinbock insisted on two hundred thousand: this they were ready to comply with, and only begged time to go to Hamburg for the money; but the general would admit of no delay; so that the inhabitants were obliged to leave the place, the mothers with their infants at their breasts, the sons with their aged fathers on their backs, others groaned under loads of household furniture; while all bewailed their fate with dreadful cries and lamentations. While they passed out the Swedes stood ready with flaming torches in their hands, and, before they were all gone out, entered the town and set fire to all parts of it, which burnt about two thousand houses, with several fine magazines, and the popish church; some old men, women, and infants also perished in the flames; but they spared the Lutheran and Calvinist churches, with about eighty houses that lay on the side next Hamburg. The Swedes, in justification of this barbarous proceeding, pretended that magazines of provisions and stores were preparing here for the Russians and Saxons, and that it was done by way of reprisal for the burning of Stade, and other cruelties committed by the Danes and Russians in Bremen and Pomerania. But it ought to be remembered, that the Danes had besieged

Stade in form, and that its destruction proceeded from their bombs; while Steinbock acted the part of a cruel incendiary against naked walls, and a poor defenceless people. What completed the ruin of Altena was the raging of the plague at the same time in Holstein; so that the Hamburgers were forced, for their own preservation, to shut the gates of the city against their distressed neighbours, many of whom perished through cold and want. The king of Denmark, however, relieved them as far as possible, and supplied them with materials for rebuilding their town, which, by the help of charities, has been done in a beautiful manner, and is at present a finer and more pleasant town than ever, it being the market for the sale of goods brought by the Danish East India company from the Indies.

The last place we shall mention in Holstein is Lubec, the chief of the Hanse towns. This city is seated at the confluence of several rivers, the largest of which is the Trave, upon which it has a harbour. It stands fifteen miles to the south-west of the Baltic, and thirty-eight from Hamburg, in the fifty-fourth degree thirty-one minutes north latitude, and in the tenth degree forty-two minutes east longitude.

This is a large, rich, populous, free, and imperial city, about two miles in length, and upwards of a mile in breadth. The city stands on the two sides of a long hill of moderate height, the eastern part extending down the declivity towards the river Wackenitz, as the western does towards the Trave. It is environed with walls, towers, false brays, wide moats, and strong ramparts, which being planted with trees, form a very delightful walk. The houses are all of stone, but old fashioned, and the streets, which are pretty straight and lofty, are for the most part steep; but others at the bottom of the hill have a canal running through the middle, with rows of limes on the sides. The churches are magnificent, and amount to about twenty, besides the cathedral. It has several large market-places, and handsome public buildings, particularly the town-house, which is a superb structure, and has several towers. On the ground-floor is the hall of audience, which is well furnished, where the senate assembles, and in this structure are the archives of the Hanse-towns. Here is also a fine exchange. The collegiate church of St. Mary is a noble pile, richly adorned with images and pictures; among the last is one called the Dance of Death. This structure is supported by tall pillars, each of one stone, and has a very lofty spire covered with gilt lead. The nunnery of St. John has an abbess or domina, a prioress, and twenty-two conventualists, and has its own church and chaplain. The convent of St. Mary Magdalen was, at the time of the reformation, converted into a poor house, which has also its particular church and chaplain. In the suppressed convent of St. Catharine has been founded a grammar school of seven classes, and in that building is a public library. The convent of St. Anne has been converted into an alms-house, and house of correction, both which are handsome buildings under excellent regulations. Here is also an hospital dedicated to the Holy Ghost, an orphan house, a small-pox hospital, and many other charitable foundations.

The corporation consists of four burgomasters and sixteen counsellors, who may be either men of letters, patricians, or tradesmen. The burghers consist of twelve companies, each of which has a vote in the public deliberations. An alliance still subsists between Lubec, Hamburg, and Bremen, and under the title of Hanse-towns they negotiate treaties of commerce with foreign powers.

The principal home commodity, besides corn, is their beer, which is highly valued, and much of it exported.

The bishopric of Lubec is a small territory, that has been enjoyed by protestant princes ever since the year 1561, when Lutheranism was established in this bishopric, and it has devolved as an inheritance to a younger son of the duke of Holstein Gottorp, styled duke of Holstein Eutin, from his usual place of residence about five miles from the city; but he has since been raised to the throne of Sweden. This territory extends about sixty miles in compass, containing several small towns, and one hundred and three villages.

S E C T. XXV.

Of the Dutchies of Saxe-Lauenburg, Bremen and Verden, and the Principality of Lunenburg-Zell. Their Situation, Extent, Produce, Government, and principal Towns.

THE dutchy of Saxe-Lauenburg is environed by that of Holstein, the diocese of Lubec, the principality of Ratzeburg, the dutchies of Mecklenburg and Lunenburg, and the four countries, as they are called. The face of the land of this dutchy is for the most part level, and the soil, according to its different goodness, is divided into wheat-land, barley-land, sand and heath. Dr. Busching observes, that in general it requires much labour to make the corn that is sown yield five or six fold; it, however, produces large quantities of flax; great advantages are also made of its woods, and, in good seasons, the mastage of the oak and beech turns to a considerable account; but grazing, however, seems most adapted to the nature of the country, and consequently to be most profitable.

The inhabitants are of the Lutheran religion, and in the whole dutchy there are only three boroughs and one market-town; though the inhabitants amount to about thirty-six thousand souls, manufactures are but little known here. The exports of the country amount annually to about a thousand lasts of rye, four hundred and fifty pound of cheese, seven thousand stone of wool, timber, and wood for fuel, to the amount of twenty thousand rixdollars, a considerable quantity of butter, and some fish.

The king of Great-Britain is entitled, on account of his possessing this dutchy, to a seat and voice in the college of the princes of the empire. But though Saxe-Lauenburg is dependent on the privy council at Hanover, it has its own particular regency, which consists of the chief governor for the time being, and three regency counsellors. It has also its own tribunal, which is composed of a judge, two provincials, and two counsellors at law, with the like number of assessors, who are not in the sovereign's service. The principal places in this dutchy are Ratzeburg and Lauenburg.

Ratzeburg is a strong town, nine miles to the south of Lubec, seated on an island, in a large and deep lake of the same name, from whence a river issues, by means of which boats go to Lubec with goods and passengers. In the year 1693, the Danes bombarding this place, laid it in ashes; but since that time the streets have been regularly built after the Dutch manner. In the market-place stands the regency office, where is also held the chief court of justice and the consistory. Near the lake to the north-west of the town, where boats go off to Lubec, is a delightful walk of limes and ash trees, named Belvedere. One part of the town belongs to the principality of Ratzeburg in Mecklenburg Strelitz: the bridge on that side is above four hundred paces long, and the rebuilding of it cost at least ten thousand rixdollars, Lubec money; but the town is to keep it in repair.

Lawenburg, or Lauenburg, a small town, situated on a hill near the Elbe and Steckenitz, twenty-five miles to the south of Lubec. Several of the houses are built so low, that the upper story lies level with the streets, while the ground floor of others is some ells higher. This town subsists by shipping, and its trade in corn and wood. It is also a great thoroughfare for goods brought up the Elbe to Lubec. Here is a toll on the Elbe, the produce of which is very considerable, and in the town formerly stood the duke's palace, which was erected on an eminence. One wing of this palace still remains, and in it is held the court of the bailiwick of Lawenburg.

We now come to the dutchies of Bremen and Verden; the former terminates to the eastward, on the principality of Lawenburg; to the south-eastward on that of Verden; to the southward on the Weser; to the westward on the same river; and to the northward on a territory belonging to the city of Hamburg, and the river

Elbe. Its dimensions are variously given; but some authors make it sixty miles in length, and fifty in breadth.

The country is very level. The Elbe and the Weser, by which the greatest part of it is environed, receive into them several other rivers; as for instance, the Oste, Schwinge, and the Luke, discharge themselves into the Elbe, and the Weser receives into it the Geeste, the Lesum, the Rodau, and the Wiedau.

The banks of the Elbe, the Oste, and the Weser are bordered with very rich marsh-lands, and in some places the country produces extraordinary plenty of grain and fruit. For the preservation of these marsh-lands against inundations, the dykes and dams are kept in constant repair at a great expence, under the inspection of officers appointed for that purpose. Great numbers of cattle are bred here: the heaths are also covered with sheep, and the breeding of bees is much followed. In some places is dug a kind of free-stone, and in others great quantities of turf, which is exported to Bremen and Hamburg, and used in the brick-kilns and glass-houses. These countries also yield a great deal of flax.

The established religion of the inhabitants is Lutheranism, and in the dutchy of Bremen are one hundred and eleven churches, with one hundred thirty-seven pastors. The supreme inspection of the churches of this dutchy, and of Verden, is vested in a general superintendent. As to the Calvinists, they form seven congregations in the dutchy of Bremen.

The only manufactures here are the making of cordage, linen and woollen cloth, kerseys, and other woollen stuffs.

The dutchy of Bremen was formed out of an archbishopric, which was subdued by the Swedes in 1644; but at the peace of Westphalia in 1648, they returned it as a dutchy and fief of the empire. In 1675, the duke of Brunswic and Lunenburg, in conjunction with the bishop of Munster, over-run the country. The conquerors thought of sharing the dutchies of Bremen and Verden between them; but Sweden kept the whole to herself, except a small part, which was restored to the duke of Brunswic and Lunenburg. During the northern war, these dutchies were reduced by the Danes; but in 1715, king Frederic IV. transferred them to the elector of Brunswic, in lieu of the sum of seven hundred thousand rixdollars, and afterwards Sweden likewise ceded them to that elector; for which the king received a million of rixdollars.

The elector of Brunswic, as duke of Bremen, bears the arms of the archbishopric, that is, Gules two keys in a saltire argent, with a small cross argent in chief.

The dutchies of Bremen and Verden are jointly under the following colleges: the regency, which consists of three counsellors, and is subordinate to the privy council at Hanover; and the chancery, which is composed of three counsellors of the regency, a director, and certain judiciary counsellors, and takes cognizance of criminal and other causes. In the high court of justice sit all the members of the chancery, with seven assessors, who are nominated by the states of each dutchy. To this court of justice all civil cases requiring a judicial decision are subject, as also the officers of the sovereign in affairs in which the prince is concerned, together with the nobility and the magistrates of the towns. From this tribunal appeals are carried to the high-court of appeals at Zell.

The chief branches of the revenues of the elector are those of the domain bailiwicks, excise, stamp-duty, &c. The principal town subject to the king of Great-Britain, as duke of Bremen, is

Stade, which is seated on the Schwinge near the place where that river flows into the Elbe. This town is the seat of the regency of the dutchies of Bremen and Verden, as also of the chancery, chief court of justice, and consistory. It contains three churches, and a Latin school. Stade was formerly a place of considerable trade, and from the year 1586 to 1612 had an English staple, which was removed to Hamburg; but by a concurrence of misfortunes it is now greatly declined. This city has been frequently taken and retaken, but in 1757 his late majesty king George II. caused great improvements to be made in the fortifications.

We

We shall now give a particular description of the imperial city of Bremen. It is seated on the Weser, which divides it into the Old and New Town, but both of these are joined by a large bridge, and a smaller one that extends over a little branch of the same river. In the year 1744, all the buildings and inhabitants were numbered, when the Old and New Town, exclusive of the suburbs, contained four thousand seven hundred and seventy-eight houses, with five hundred and sixty-five other edifices, as store-houses, brew-houses, and the like, four thousand and ninety-nine married couple, that is one thousand five hundred and eighty-nine Calvinists, one thousand seven hundred and seventy-two Lutherans, eighty-one Papists, two hundred and eighteen widowers, one thousand two hundred and thirty-nine widows, two hundred and thirty-three single men, who were house-keepers, and three-hundred fifty-nine single women house-keepers.

The Old Town, which is the largest and most populous, is divided into four parishes, according to the four capital churches belonging to the Calvinists, viz. of our Lady, St. Ansgarius, St. Stephen, and St. Martin. In this part stands the cathedral, which belongs to the dutchy, and is frequented by the Lutherans. Under its choir is the lead-cellar, remarkable for the undecayed bodies that lie there. Here is also the convent of St. John with its church, the celebrated academy of the Calvinists, with its spacious library, the armoury, the hospital, in which is an anatomical theatre, the work-house, and other public buildings. Under the large bridge of the Weser is a water-wheel, which works an engine that raises the water by which the city is supplied, as in London, by pipes laid under the streets; and at the other end of this bridge is an ingenious fulling-mill.

In the New Town is St. Paul's church, which belongs to the Calvinists, and in the suburbs are two more. The New Town consists chiefly of gardens and little pleasure-houses belonging to the principal merchants, and other inhabitants of the Old city; it has larger and more regular streets than the latter, and most of them are planted with rows of limes and wild chesnuts. The Calvinist is the established religion, it being professed by the whole body of the corporation, though with respect to numbers they are nearly equalled by the Lutherans. The corporation is composed of four burgo-masters, and twenty-four counsellors, or aldermen. The merchants and tradesmen have their elders; but these have no share in the government of the city. The garrison consists of about six hundred men. Here are several manufactures, and the inhabitants carry on a considerable trade.

Verden is bounded on the east and south by the dutchy of Lunenburg, on the west by the Weser and the dutchy of Bremen, and on the north by the dutchies of Bremen and Lunenburg, extending both in length and breadth about twenty-eight miles.

This dutchy consists chiefly of heaths, and high, dry land, as also of forests; but there are good marsh-lands on the rivers Weser and Aller. The latter waters almost all the southerly, but the Weser only a part of the westerly boundaries of the country, and this last receives also the Aller. The other principal river is the Wumme, which rises on the borders of Lunenburg, traverses the dutchy from east to west, and receives into it the smaller rivers that rise here.

The inhabitants are Lutherans, who have the same consistory with the dutchy of Bremen, and one and the same general superintendent.

Verden was formerly a bishopric founded by Charlemagne; but John Frederic the last bishop was of the royal house of Denmark, and afterwards became king of Denmark and Norway, under the name of Frederic III. At the peace of Westphalia in 1648, the crown of Sweden obtained the bishopric as a dutchy, and in 1712, the Danes invading Bremen, the inhabitants of Brunswick-Lunenburg possessed themselves of the dutchy of Verden, on account of the plague raging in the former. In short, in the year 1715, by virtue of the alliance concluded at Wismar, both Bremen and Verden were ceded by the king of Denmark to the electoral house of

Brunswic-Lunenburg; and this cession was made by the crown of Sweden in the year 1719.

This dutchy has the same regency as that of Bremen, and contains several towns, the principal of which is

Verden, seated on the Aller, a river that divides itself into two branches, the smaller of which lies near the town. It is situated twenty-six miles to the south-east of Bremen, and has four churches, which are the cathedral, the church of St. Andrew, which lies near it, that of St. Nicholas, and that of St. John. There is here also a Latin school.

The dutchy of Lunenburg-Zell is bounded by the river Elbe, which on the north separates it from Holstein and Lauenburg; on the east by the marquisate of Brandenburg, and on the west by the dutchies of Bremen and Westphalia, it extending about a hundred miles in length, and seventy in breadth.

The soil is various, for along the Elbe, the Aller, the Zetze, and some smaller rivers, are fruitful marsh-lands; but other parts of the country consist of barren sand, others of heaths, others of turf, and others are swampy. The worst parts of the country are towards its center, through which lie the main roads; but a traveller is not from thence to form an idea of the whole country. Agreeably to the diversity of its soil, it produces wheat, rye, barley, oats, buck-wheat, flax, hemp, hops, and garden plants. They have also oak, beech, firs, pines, birch, and elder, with other trees. Some bailiwicks do not yield a sufficiency of wheat; but others again have a superfluity; in some, few horned cattle and horses are bred, though in others they abound. The heaths are covered with numerous flocks of a small kind of sheep, that have long and coarse wool; and the culture of bees is so great, as to afford considerable quantities of honey and wax. Lunenburg abounds in excellent lime-stone and valuable salt springs, and the rivers yield plenty of fish.

With respect to the rivers, the Elbe, which traverses the east and north side of this country, is of considerable advantage, from its fertilizing the adjacent marsh-lands, and its having fisheries, navigations, and tolls. This river receives into it the Zetze, which flows from Brandenburg; the Ilmenau, another navigable river which rises in this country; the Luhe, which also rises here; the Seeve, and other smaller rivers. The Aller, which is also navigable, traverses the whole southern part of the dutchy, and being joined by several small rivers, continues its course into the dutchy of Verden.

The inhabitants of this country are of the Lutheran religion, and there are near two hundred parish churches in this dutchy. These are divided into fifteen superintendencies, and over these are appointed two general superintendents.

The principal manufactures made here are those of linen, cotton, woollen cloths, ribbons, stockings, and hats; and at Zell are some ingenious artificers in gold and silver.

The exports chiefly consist of corn, meal, garden-stuff, hops, flax, starch, timber, beams, masts, all kinds of wooden ware, ships, barges, boats, horses, black cattle, fatted calves, milk, butter, cheese, poultry, wool, wax, honey, salt, sugar, thread, linen, knit and wove stockings, stuffs, works in gold and silver, &c. The conveyance of merchandize from this place to and from Hamburg, Lubec, and Altena, affords a considerable branch of commerce; many of the inhabitants procuring subsistence by navigating the rivers.

The principal towns in this dutchy are the following:

Lunenburg, the capital, is seated on a navigable river called the Elmen, or Ilmenau, which runs through a part of the town. This city is fourteen miles to the south-west of Lawenburg; it is surrounded with moats and walls, strengthened with towers, and is two miles and a half in compass. It consists of thirteen hundred houses, with between eight and nine thousand inhabitants. Here are three parish churches, that of St. John, to which is annexed the superintendency, with a Latin school consisting of five classes; and those of St. Nicholas and St. Lambert. In the church of St. Mary was formerly a convent of Minims, which at present serves for the town armoury, a library, and a house of correction.

tion. It has also three hospitals, two of which have each a church. In the market-place stands the prince's palace, with the guild-hall, and fronting them is the Præmonstratensian abbey of Heilighenthal, which was sequestered by the magistracy in 1530, and its church now serves for a magazine of salt. In 1753 an anatomical theatre was built here. The convent of St. Michael, which was formerly of the Benedictine order, and consisted of monks of noble families, embraced the sentiments of Luther in the year 1532; and in 1655 duke Christian Lewis, with the approbation of the nobility, suppressed the monastery, and founded within it a school for martial exercises, which is stiled the academy. The director, like the antient superior of this house, is the head of the states of this principality; he is also president of the provincial college, and next in rank to the privy counsellors. This person is even stiled excellency, and in public instruments makes use of the following title: By the grace of God, landschaft, director, and lord of the mansion of St. Michael, in Lunenburg. He is also chancellor of the academy, where young gentlemen, natives of the principality of Lunenburg, are maintained gratis; but foreigners are educated at a certain price, and taught French, fencing, riding, and dancing. The members of this academy live in a spacious stone edifice, built in the year 1711, and counts and even princes have been of their number. Within the conventual church of St. Michael is the antient burial-place of the dukes, and on its great altar stands a celebrated golden table, which is a board formerly plaited over with gold; but which, in 1698, was stripped by a famous robber named Nickel List; so that at present only a small quantity of the gold remains. In the convent is also a Latin school of four classes, to which belongs the hospital of St. Benedict, with its chapel, and several country churches and considerable estates.

In a part of the city, within the walls, salt springs arise; this quarter, which is called the Sulze, is walled in, and has its own separate magistrates. It consists of fifty-four small houses built deep in the earth, and in each are four large leaden cisterns, which are new cast every month for receiving the salt water, which is left to exhale in them in order to form the salt. These springs are very copious, and four of them are in this place, three in one of the town moats, and one near the building that once served for a Minorite convent. From these several springs the salt-water is conveyed by pipes into a reservoir in the Sulze, and there distributed among the houses. The salt-houses are fifty-four in number, and contain two hundred and sixteen cisterns of salt, which are daily boiled; and of these salt-works a fifth part belongs to the sovereign.

To the west of the city are two rocks, known by the names of Schildstein and Kalkberg. The latter is near the New-gate, and even within its walls. This is a steep rock, in which are spacious caverns that contain a great number of terrasses. Towards the city it is surrounded by a crown-work, which joins the town wall; on the other side is erected a horn-work; and round its summit, which is level, runs a breast-work, on which are planted some cannon.

The exports of this city consist of salt, lime, and beer, wax, honey, wool, flax, linen, and frieze. Goods are also brought here from all parts of Germany, and forwarded down the Ilmenau to Hamburg, and by means of the Achse to Lubec; their returns coming the same way. The warehouses for these imports and exports stand on the Ilmenau, and the commerce carried on here is superintended by a particular commission.

Ultzen is a town seated on the Ilmenau, by two branches of which it is surrounded. Here that river first receives its name, it being formed by the conflux of eleven rivulets. It was once navigable at this place; ships from England even traded here, and the antient harbour belonging to it is still to be seen. In the great church is also shewn a ship of gilt copper, which was a present to the corporation from the English. The town contains about three hundred and twenty-nine houses, three hundred and four of which belong to the burghers, and the others are inhabited by the gentry, ecclesiastics, and men of letters. The first minister of the great

church is provost, and superintendent of seventeen country ministers. In the town are two alms-houses, with a church to one of them; and without the town is another alms-house, with a church. The adjacent country produces a very fine sort of flax, and the neighbouring villages weave great quantities of linen. The town had formerly a very flourishing trade in thread, linen, woolen, wax, beer, and brandy, and received great advantage from its being a considerable thorough-fare for goods and persons; but its trade is at present greatly declined.

Zell is a fortified and well built city, seated on the Aller, which is here navigable, and, in conjunction with the suburb of Fritzenwiese, consists of five hundred and sixty-four houses; but, including the other suburbs, summer-houses, and buildings without the gates, their number amounts to about fourteen hundred. At this place are held the high court of appeals for the several territories of the electoral house of Brunswic-Lunenburg, with the chancery, and chief tribunal of the principality of Lunenburg. The other public edifices are the guild-hall, the riding-house, the mews, and the armoury. The remarkable buildings in the suburbs are the Neustadt church, that of the Calvinists, the prince's mews and garden, St. George's alms-house, the Alumlager church, the alms-house of St. Anne, the hospital for disabled soldiers, and the orphan-house. This town principally subsists by its being a great thorough-fare, and the seat of the high court of appeals. It has manufacturers and artificers in various branches, particularly in gold and silver, whose performances are much admired even in other countries.

Haarburg, a town seated on the Seeve, which runs through it, and, after being joined by the Engelbach, discharges itself, near this place, into the Elbe. It consists of four hundred and seventy-two houses, besides those belonging to noblemen, and is the seat of the two general superintendences of this principality; as likewise of a special superintendency under the direction of the general superintendent, who is always the head minister of the parish church. Here are manufactures of cotton, stockings, hats, ribbons, wax-bleachery, starch, and the refining of sugar. As Haarburg is commodiously situated for commerce and navigation, it carries on a considerable trade to Holland in knee-timber, beams, masts, and floats.

SECT. XXV.

Of the Dutchy of Brunswic-Lunenburg, or the Electorate of Hanover, with the Principality of Grabenhagen, and the Counties of Blackenburg and Rheinstein; their Situation, Extent, Produce, Manufactures, Government, and principal Cities and Towns.

THE dutchy of Brunswic, taken at large, includes the dutchy of Hanover, the principality of Grabenhagen, and the counties of Blackenburg and Rheinstein; and is bounded on the south by Thuringia and Hesse Cassel; on the west by the river Weser, which divides it from the principality of Minden, and the counties of Lippe and Hoyer; on the north by Lunenburg; and on the east by Magdeburg, and the principalities of Halberstadt and Anhalt.

But within this compass is included not only the dutchy of Brunswic-Lunenburg, which belongs to the king of Great Britain, but Brunswic-Wolfenbüttele, which is governed by its own sovereign, and will be hereafter described: we are now to treat only of the former.

The dutchy of Hanover, also called Calenberg, from a castle that was formerly the residence of the prince, is bounded on the north by Lunenburg-Zell; on the east by the dutchy of Brunswic-Wolfenbüttele, and the bishopric of Hildesheim; on the south by Grubenhagen, which Moll calls Brunswic-Lunenburg; and on the west by the county of Schawenburg; extending thirty three miles from north to south, and eighteen from east to west.

All the rivers, streams, and brooks in this principality discharge themselves either into the Weser, or the Leina. The former of these washes it on the west, and the latter on the east. The principal mountains are the Deister and the Suntel in the north, and the Solingerwald in the south; but the mountainous and stony parts, with the morasses, heaths, and sands, yield very little: this country has, however, many marshy, clayey, and loamy tracts, mixed with earth and sand, where all kinds of fruit and vegetables thrive, as wheat, rye, barley, oats, lentils, peas, beans, vetches, buck-wheat, plenty of good fruit, excellent garden plants and roots, hops, flax, and tobacco. It has also fine woods of oak, beech, pine, asp, birch, alder, &c. which afford timber for the building of ships and houses; as also wood for fuel and other uses. The mastage from the oaks and beech are likewise of great advantage.

This country also abounds in a large breed of horses, black cattle, and sheep; and there is here no want of venison, game, and fish. At several places in this principality are marl-pits, quarries of free-stone and mill-stones, coal-pits, and mines of rich iron ore.

In this country there is no want of manufactures, great quantities of linen yarn are spun here, and linen wove not only sufficient for home consumption, but likewise for exportation, particularly a most beautiful damask. The printing of linen is here brought to such perfection, that it begins to take place of the use of India chintz and calicoes. Cotton is likewise spun here, and knit or wove into stockings, gloves, and caps. The oil-skins and carpets printed and painted here are of the best sort. Various branches of the woollen manufacture are made in this principality, more particularly at Gottingen; among these are light and substantial fine cloths, which, for their beauty and the brightness and durableness of the colours, equal the best cloths made in Holland. The worsted stockings made at Gottingen are also distinguished for their fineness. At Hanover are two celebrated gold and silver manufactures for galloons and laces; as also for fringes, tassels, embroidery, and other works. Among the other manufactures are silks, stuffs, stockings, and ribbons. In different parts are iron-works, mills for the flattening of copper, powder mills, paper and fulling mills, brass foundries, glass-houses, &c. Large quantities of goods manufactured here are sent abroad, particularly linen, linen-yarn, Gottingen cambrics, baraguins, and other stuffs, in which a great trade is carried on to Hamburg, Bremen, Holland, Francfort, and even to Italy.

In this principality are nineteen cities and seventeen towns. The four following are styled the great cities: Gottingen, Hanover, Nordheim, and Hamelen, the others being called the small; and in the whole principality are three abbeys and six convents, which last are all inhabited, one by men, and five by women. There are here also two hundred and ten Lutheran parish churches, five churches belonging to the Calvinists, and six churches and chapels of the Roman catholics.

There are few sovereign princes whose finances are said to be in so good a condition as those of this elector's, owing to the œconomy of the two preceding princes, who have yet kept up a splendour suitable to their rank: the government here being said to be the least despotic of any in the empire; for the elector can neither make laws, nor raise taxes, without the consent of the states, consisting of the nobility, clergy, gentry, and towns, who meet regularly every year.

The princes of the two illustrious houses of Brunswick are descended from Ernest duke of Lunenburg, who died in 1546; the Wolfenbüttele and Bevern branches, (the former of which is now extinct) from Henry the eldest son, and the electoral house of Hanover from William the youngest. The electorate attached to the dutchies of Hanover and Zell was concerted at the congress held at the Hague in the year 1692, by king William III. and effected by his influence, in conjunction with that of most of the protestant princes of the empire. Accordingly the same year, the emperor Leopold conferred the dignity of elector on prince Ernest, grand-

father of his late majesty king George II. and his heirs, with the title of standard-bearer to the empire. This, however, met with opposition from the college of princes, and particularly from the pope and his adherents. However, in 1708, after the death of Ernest, the first elector, the three colleges of the empire agreed to the establishment of this new electorate in the person of his eldest son, afterwards George I. king of Great Britain, who then took his seat in the diet: but the office of standard-bearer being claimed by the duke of Wurtemberg, the title of arch-treasurer of the empire was the next year given instead of it to the elector of Hanover.

The revenues of the elector from all his German dominions rising from salt-pits or springs, taxes, and cattle, merchandize and inns, especially from rich mines of silver, iron and copper, are computed to amount to at least four hundred thousand pounds per annum; or, according to Mr. Hanway's computation, at four millions of dollars, or seven hundred thousand pounds; and it is said, that from these dominions alone he may raise an army of between thirty and forty thousand men, without greatly burdening his subjects. His majesty, the present elector, has here some troops of life-guards, and two regiments of foot guards, of one battalion each, with an uniform of red, lined with blue, and at the court of Hanover are the officers of state usually found in the courts of crowned heads.

The government here is under the management of the six following councils. I. The council of state, to which all Hanover is subject, which receives orders immediately from the elector, countersigned by a German envoy from that electorate, who always attends the British court.

II. The war-office.

III. The treasury.

IV. The chancery.

V. The justice court, and

VI. The consistory, which is composed of the ministers or presbytery of the city of Hanover, assisted by lay-elders, who are generally persons distinguished for their learning and piety as well as rank. It is observable, that every protestant prince and state in Germany has this kind of spiritual courts; but these have no power in civil affairs, divorces only excepted; and the prince, or state, has always a deputy present at all their meetings, to be a check upon their power, and to keep it within due bounds.

This principality is divided into three quarters or departments; the first of which is the Hanover quarter, in which are eight cities, three towns, two abbeys, six convents, and two hundred and twelve villages.

The city of Hanover, the capital of his Britannic majesty's German dominions, and the seat of the electors before their accession to the crown of Great Britain, is pleasantly situated on a sandy hill upon the Leina, which is only navigable for small boats, in the fifty-second degree twenty-nine minutes north latitude, and in the ninth degree forty-five minutes east longitude, that is three hundred and sixty-five miles east of London, and forty miles to the west of Brunswic. It is walled round, regularly fortified, and the ravelins before the gates well provided with cannon; but does not seem remarkable for its strength. The houses are mostly of timber and clay, though many are of stone and brick; but the streets are broad, and in winter well lighted with lanterns. It contains about twelve hundred houses, some of which are very large and handsome structures. The Neue Graben, as it is the newest, makes the best appearance of any part of the city. The elector's palace, is situated on the banks of the Leina, and as it suffered greatly by fire in the year 1741, a considerable part of it has been since rebuilt with great magnificence. It has several courts, and the rooms which are grand and commodious, are chiefly hung with very rich tapestry. In apartments in this structure the privy-council and commissioners of war hold their meetings. The opera house, and the theatre for the French comedians are both within the palace, and though antient are commodious; but the whole is rather rich, decent, and elegant, than very splendid.

splendid. The guard is always mounted, and an open table kept, even when the king is not in his electoral dominions, at which time the administration is conducted with the utmost dignity. During the whole winter a play is exhibited, and a concert performed twice a week, at his majesty's expence, when the courtiers without exception take place according to their rank. In the church belonging to the palace, which is very splendid, is kept a treasure of great value, consisting of reliques, gold and silver plate and gems, collected by duke Henry the Lion, in his journey to the East in 1171, and the succeeding years. The elector's armoury and fine stables stand in a row along the Leina. The states house in East-street is a very noble structure, and within it are held the diets and high court of justice. In the same street is also the Lockumer Hof, where the abbot of the convent of Lockum resides, and near St. Giles's church is the chancery. In the Old Town there are only three parish churches, and one for the garrison. Besides these structures, there is an orphan house, the hospital of the Holy Ghost, the poor house belonging to the magistracy, a spinning-house, and a house of correction.

The New Town, which lies on the other bank of the river, has a communication with that already described by means of bridges. This part is fortified, and though it consists of only three hundred and seventy six houses, is populous, and makes a good appearance. It is the seat of the consistory for the electoral territories, and likewise of the general and special superintendency. In the market-place is a curious grotto, but the water-works belonging to it are fallen to decay. In the same part is also the church of St. John, and on the parade is a large edifice of stone, in which are kept the electoral archives and library; the latter of which is one of the most copious and splendid in all Germany. There are here also several palaces, a German and a French Calvinist church, another for the Roman catholics, a Jewish synagogue, and a Latin free-school.

In short, Hanover is in many respects a pleasant city, and, though it does not equal Berlin and Dresden, may be esteemed elegant; but it has no trade worth mentioning.

The neighbouring country makes an agreeable appearance, and the number of kitchen and pleasure-gardens before the gates, with the elegant buildings belonging to them, appear very extraordinary; particularly there is a delightful vista which extends to Monbrillant and Herrenhausen, two electoral palaces; but the former is now falling to decay.

The palace of Herrenhausen is seated about two miles to the north of the city. But Mr. Hanway observes, that he does not know whether he was more mortified or more surprized to find that the building fell vastly short of his expectations; for though in England, it is said, our hospitals are palaces, and our palaces more proper for hospitals, yet he had conceived the opinion that this palace, so much talked of, was indeed grand, and worthy of his majesty. It was built in the year 1670, by Ernest Augustus, the late king's grandfather: the greatest part of it is of wood, and the apartments in general rather give the idea of a large antient mansion-house belonging to a private gentleman in England, than of the palace of a great monarch: but it has rich furniture, and some good pictures. The garden, however, is justly worthy of admiration. Our author had seen none in Germany comparable to it, though it wants those exquisite charms, and that enchanting variety, capable of being produced by an inequality of ground, of which we have numerous proofs in Great Britain. One side of the garden has a narrow piece of water above a quarter of a mile in length. The walks, which are wide and spacious, are mostly laid with gravel. The garden is divided into large squares and basons, and in the intermediate spaces are lofty groves and one of the finest orangeries in Europe. Here are beautiful cascades, and noble fountains, with very large basons; among these the jet d'eau, erected in 1716 by Mr. Benson, perhaps exceeds any thing of the kind in the whole world: it throws the water seventy feet high. Here also, according to the German taste, is a sylvan theatre, cut out in green seats, with arbours and sum-

mer-houses for the actors to dress in; and here are sometimes exhibited plays and masquerades: this theatre is adorned with statues, and occasionally illuminated in a grand taste.

The next division in this country is called the Hamelen and Lauenau quarter, which contains three cities, ten boroughs, and a hundred and twenty-eight villages. The most considerable place in this division is

Hamelen, a fortified city, twenty-three miles south-west of Hanover, seated in a fine country on the banks of the Weser, which washes it to the west, and over it is a bridge of nine wooden arches supported by stone piers. The Weser also forms at this place a small island, and for the farther convenience of shipping here is an admirable sluice, finished in 1734, at the expence of eighty thousand rixdollars. The river Hamel, whence the town obtains its name, runs into the town moats, and continuing its course round the walls, discharges itself into the Weser. In this city are six hundred houses belonging to the burghers, and fifty ecclesiastical and other edifices. Though the town consists of but one parish, it has two churches, an abbey, now secularized, besides a church belonging to the French Calvinists, and once a quarter the Roman catholics perform divine worship in a house hired for that purpose. Here is also a Latin free-school, an hospital, and a poor-house. Here are woollen, silk, and stocking manufactures; and from hence great quantities of thread and linen are exported.

The Gottingen quarter is situated apart from the others, and once constituted a distinct principality. It contains eight towns, with the same number of secularized convents, fifteen royal bailiwicks, and eleven noblemen's jurisdictions, under which are four market-towns and a hundred and seventy-nine villages. The principal places in this district are the following:

Gottingen, a city seated in the fifty-first degree forty-six minutes north latitude, and in the ninth degree fifty-six minutes east longitude, in a fertile, spacious, and pleasant vale, along the water called the New Leina, which is a canal drawn from the river of that name. This canal separates the Old from the New Town, and the marsh. The ramparts which encompass the town command a delightful prospect of gardens, with meadows, fields, and eminences. These are about six hundred and ninety-seven rods in circuit, and would form a fine walk were the useless breast-works on it removed. The town consists of above a thousand houses; and, since the university has been built, is so embellished with new buildings, that it is at present one of the best built towns in all Lower Saxony, and the fine free-stone pavement on both sides of the streets have few equals. In winter the streets are illuminated with lamps. In the town are five parish churches, the principal of which is that of St. John, together with an alms-house, that has a church and particular preacher of its own; as also another for the Calvinists. The Papists here say mass in a private house. The church of the bare-footed friars is converted into an armoury.

The principal ornament and advantage of this city is the university, named Georgia Augusta, founded in the year 1734, by king George II. in the room of the antient Gymnasium in the Dominican convent founded in 1586. This university has acquired a distinguished reputation. It has a large splendid church, which was that belonging to the Dominicans, and to it belongs a new and stately structure of stone, the ground floor of which serves as a hall for public lectures, and in that above it is the library, with the council chamber, and other apartments. This library, to which considerable additions are every year made, is called the Bulowan, from its receiving its original from a collection of about ten thousand volumes, bequeathed by baron Bulow, for the public use, and by his heirs given to the university. A royal society of sciences founded in 1751, and a royal German society also form a part of the university; it has likewise a fine observatory, erected on a tower that stands on one of the ramparts, together with a noble physic garden, near which is a handsome anatomical theatre, a school for teaching midwifery, a *seminarium philologicum*, under the direction of the professor of eloquence,

quence, and an academy of exercises. The Latin free-school here is under excellent regulations, and governed by eight masters.

Along the marsh, from the New Leina to the town wall, runs a beautiful vista of lime-trees. Many curious manufactures are carried on in this city, which has a great trade. The administration of justice for the town-courts is vested in a judge, nominated by the sovereign himself and the magistracy. In the year 1757 and 1758 this city was for some time in the hands of the French.

Nordheim is situated on the Ruhme, which here divides itself into two branches, over each of which is a stone bridge. This is the third in order of the great towns of Hanover; it contains five hundred houses, and has an antient abbey now secularized; but has only one parish church, and a grammar-school; yet carries on some manufactures. The governor of the town examines causes, and manages trials; but the sentence is pronounced by the burgomaster and council, without his concurrence.

Munden, a town situated in a vale by the Fulda, which a little below this place joins the Werra, from which conflux the river is called the Weser. These streams, with the meadows along the Weser, the neighbouring gardens, woods, and hills, form on all sides delightful prospects; but the town frequently suffers by inundations. It consists of six hundred and seven houses, and in it are two Lutheran parish churches, with a Latin free-school and an alms-house. The Calvinists perform their worship in an elegant building, in which is an organ. In the town is a double garrison, that is, one of four companies maintained by the town, and a regiment belonging to the sovereign that is quartered in barracks. These barracks are situated in a large stone edifice, that was originally a palace built by duke Eric the younger. The burghers of Munden are free of Brunswic and Osterade, and those of Osterade and Brunswic free of Munden. The town has above two hundred gardens belonging to it, but has little corn-land. The inhabitants chiefly consist of silk and damask-weavers, vinegar-brewers, tobacco-spinners, and necessary artificers; but the principal support of the town is derived from its traffic and navigation.

We now come to the principality of Grubenhagen, so called from its formerly belonging to the family of the Grubes; it is surrounded by those of Hanover and Wolfenbüttele, the county of Wernigerode, the principality of Blankenburg, the county of Hohenstein, the lordship of Klößen, and Eichfeld; and one distinct part of it is entirely encompassed by Hanover, Wolfenbüttele, and a part of the diocese of Hildesheim. This tract of country, which includes a part of the Hartz forest, is about forty miles long, and the same in breadth; but is almost over-run with woods.

This country has some fertile tracts that produce wheat, rye, barley, oats, peas, beans, and buck-wheat; but the greatest part of it being mountainous, and little corn growing in the lands bordering on the Hartz, and none at all within that forest, agriculture is far from being the principal employment of the inhabitants, who are obliged to be supplied with corn from other countries. They have, however, great quantities of flax, the cultivation of which, and making it into thread and linen, are among the principal occupations of the inhabitants. In some bailiwicks the breeding of horned cattle and sheep turns to a pretty good account; but their principal advantages arise from the large forests, quarries, and mines of this country. These forests consist of oak, beech, pines, birch, and alder: its minerals and fossils are chiefly free-stone, marble, slate, lime, gypsum, alabaster, jasper, salt, zink, sulphur, and cobalt; its metals are some gold, with a great deal of silver, copper, iron, and lead.

The principal rivers that run through this principality are the Leina, the Oder, and the Ocker.

The exports of this country are flax, thread, linen, timber, sand, stone, slate, marble-works, iron, copper, lead, salt, vitriol, sulphur, lapis calaminaris, zink, powder-blue, starch, various woollen manufactures, and fatted sheep.

Lutheranism is the only religion of this country, which has forty-one parish churches, besides those in Einbec and Osterode, all ranged under four superintendents; but the ministers of those cities are not subordinate to them; but have seniors of their own. The principal towns in this country are

Einbec, which is seated on the Ilne, one branch of which runs through the town, and the other above it; but both meeting soon after, run into the Leina. The town of Einbec is encompassed with ramparts, bulwarks, towers, moats, and several out-works, and contains about seven hundred and sixty houses belonging to the citizens, seventy-seven public edifices, and eight hundred fourteen granaries, stables, and other out-houses. The city is divided into three parts, called the Markt, the Neustadt, and the Munster. In the two first are parish churches; but the last has been incorporated with the cathedral of St. Alexander. Among the other public buildings are a grammar school belonging to the corporation, which has seven masters, an orphan-house, in which forty or fifty children are educated, under the immediate direction of the royal regency, they being maintained out of the provincial revenues. The hospital of the Holy Ghost, the great poor-house of St. Bartholomew, and a lesser poor-house. In this city are made cloth, flannels, baize, shalloons, serges, crapes, calamanços, druggets, dimity, and other stuffs, and at the orphan-house they carry on the printing of linen and cotton.

Osterode is situated near the Hartz, by a little river called Apenke, and consists of five hundred and eighty-two houses, with a castle, in which several of the dukes of Brunswic-Lunenburg have resided. In the town is a superintendency, with three parish churches, a Latin school, and a granary erected for the use of the miners and other labourers on the Brunswic part of the Hartz, and from whence they are always supplied with rye at a moderate price.

Scharzfels is a remarkable castle, which stands on a high mountain, or rather a vast rock, on the borders of the Hartz. The only access to it is by means of high stone-steps, at the summit of which is a round free-stone tower of a considerable height and thickness, but without any roof. In the lower part of the castle are barracks erected along the wall. This fortress is defended by a few cannon; it has a small garrison under the direction of a commandant, and here state-prisoners are sometimes confined. In it is a very deep well, the water of which is drawn up by means of a large wheel. On descending northwards from the mountains, after passing through a narrow valley, and then ascending a hill, you come to the famous Scharzfel cave, which properly consists of five caverns, all lying in a row. The first of these is very large and clear, the ground being sunk in towards the center, and thus admits the light; but the others are quite dark.

Before we take leave of this country, it is proper to take notice of that part of the Hartz which is included in it, and subject to Brunswic-Lunenburg.

It is observable, that the air is here so cold, that the winters usually last one-half of the year. The rains, snows, and fogs are here more frequent than in the level countries round it; yet those who live above ground, and not among the mines, and forges, arrive to as great an age as the inhabitants of the plains. Tillage and the cultivation of fruits turn to no account; so that the whole harvest consists of good hay. The trees which cover the mountains consist of oak, beech, ash, aspen, alder, birch, &c. but two-thirds of them are firs, pines, and other soft wood. The abundance of timber is here the more valuable, as without it the mines and forges could not subsist. The minerals found here are yellow oker, vitriol, sulphur, lapis calaminaris, borax, cobalt, lead, iron, copper, silver, and some gold.

The Brunswic-Lunenburg Hartz being divided into the Upper and Lower, the mine-workers are distinguished by the same divisions. The Upper Hartz, with its mine-works, is termed particular, or belonging only to the electoral house of Brunswic; or else common. The produce of the particular mine-works about the year

1724, reckoning silver, copper, iron, lead, and borax, amounted to no less than seven hundred and six thousand one hundred and twenty-five rixdollars; and on deducting the expence out of this sum, the surplus accruing to the sovereign amounted to about a hundred and thirty-six thousand rixdollars, and that arising to the other proprietors to a hundred and twenty thousand five hundred and sixty-seven. The common mine-works in the Upper Hartz used to yield annually in the above-mentioned ores about two hundred and eighty-six thousand rixdollars, of which the surplus arising to the sovereign amounted to about fifty-three thousand rixdollars, and that of the sharers to nineteen thousand seven hundred and seven. The common mine-works of the Lower Hartz have produced annually in gold, silver, copper, lead, borax, sulphur, green and white vitriol, zink, and pot-ash, about a hundred and eighty thousand six hundred and eight rixdollars, of which near ninety-six thousand are its neat produce. Thus the whole Hartz yield annually about one million one hundred and seventy-two thousand seven hundred and thirty-three rixdollars, of which, to the value of two thousand eight hundred and eighty are gold, which is coined into ducats, and eight hundred and two thousand eight hundred and sixty silver, which, after a deduction of all charges, the neat profit amounts to four hundred and twenty-five thousand two hundred and seventy-four rixdollars.

The silver is coined immediately in the Hartz, and the other products the mine-offices at Hanover and Wolfenbottle take at a stipulated price, making their returns in tallow, leather, and other necessities for the mine-works, which are also furnished at a certain rate.

The inhabitants of the Hartz are composed of miners, labourers in the smelting-houses, wood-heavers, carriers, and the sovereign's officers and servants; together with ministers, school-masters, artificers, and tradesmen, who have there no other taxes but one rixdollar on every house, and a lodger and mine-officer only half a rixdollar, with a small excise on the beer carried thither; and even this is applied to the benefit of the miners and labourers in the smelting-houses.

The principal places in the Hartz are,

Clausthal, a considerable mine-town, which has broad streets, and upwards of nine hundred houses; it contains about ten thousand inhabitants, two churches, a grammar-school, which has nine masters, and an orphan-house. This is the seat of the mine-office, which belongs particularly to the elector of Brunswic-Lunenburg, and has a mint, in which between four and five hundred rixdollars are annually coined. There is here also a house for the smelting of silver.

Cellerfeld is an open mine-town, separated from Clausthal only by a small rivulet. This is the seat of the mine-bailiwick-office of the common Upper Hartz; as also of a common mint, in which between two hundred and fifty thousand and three hundred thousand rixdollars are annually coined in silver specie. The town contains about five hundred and sixty houses, a good library at the parish church, and a Latin school. This town suffered greatly by fire in 1737 and 1753.

What is here particularly called the Lower Hartz, is a steep high mountain of pretty large extent, also named Rammelsberg, which is possessed in common by the electoral and princely houses. The ores found in it are of a very solid texture, and make such resistance against the hammer and wedge, that for the easier dissolution of them, the workmen are obliged to make use of fire. On this mountain are twelve mines, of which the magistracy of Goslar work four, though to a disadvantage, they being obliged to deliver a certain part of the ore gratis to the sovereign, and to sell the remainder to him at the price formerly stipulated to them, which it at present too low; but on default of this the town forfeits its forest-right, which it holds on these conditions.

Goslar, a free imperial city at the foot of Rammelsberg, is seated on the river Gose, which at a small distance from the town discharges itself into the Ocker. The buildings are in the old taste, except in that part of the town that was burnt down in 1728, and has been rebuilt in the modern manner. The established religion is Lutheranism, and in the city are four parish churches

and two Lutheran foundations, which are that of St. Simon and St. Jude, that was founded as a canonry of Augustins in the year 1040, by the emperor Henry III. and the imperial foundation of Petersburg, which received its rise from the munificence of the same prince and his consort Agnes, in honour of St. Peter. The building has been pulled down by the burghers, and, since the year 1603, the chapel of St. Catherine has been assigned for the canons, who are Lutherans, and their principal officer, who is a dean. Here are two other Lutheran convents, that of Frankenberg, which consists of a domina and three conventualists, which belongs to the principality of Wolfenbottle; and the nunnery at Neuenwerk, which is dependent on the magistracy, and has a church of its own. The city derives its principal subsistence from the neighbouring mines, the inhabitants being chiefly employed either in digging, cleansing, tempering, and vending the metals and minerals, or making and selling the hard-ware formed of them. They also have breweries of beer, and trade in provisions, which they sell into the Hartz. This city is under the protection of the king of Great Britain, as elector of Hanover, alternately with the duke of Brunswic-Wolfenbottle. Here Bartold Schwartz, a Benedictine monk, is said to have discovered the art of making gunpowder.

S E C T. XXVI.

Of the Dutchy of BRUNSWIC-WOLFENBUTTLE.

Its Situation, Produce, and Rivers: the Religion and Commerce of the Inhabitants: the Title, Arms, Offices, Revenues, and Forces of the Prince; with the principal Places in this Dutchy.

WOLFENBUTTLE forms a part of the dutchy of Brunswic, and is divided into two parts by Halberstadt and the diocese of Hildesheim. The north part is environed by Lunenburg, Brandenburg, Magdeburg, Halberstadt, and Hildesheim. The south part lies between the two last, the county of Wernigerode, Grubenhagen, Hanover, Cowey, and the county of Lippe.

The eastern half of the south part, which lies between the Leina and the Ecker, contains under it a part of the Hartz, with the mine salt-works, which the prince holds in common, as hath been already observed, with the elector of Brunswic-Lunenburg. The southern part of this principality consists chiefly of hills and woods, with little arable land; but, on the other hand, has great plenty of timber, iron, and glass-houses, the manufactures of which are greatly admired, particularly those of looking-glasses; with a fine porcelain manufacture. The north part of the principality is more level, and produces corn, flax, and hemp, with all kinds of pulse and fine fruit; grazing also turns to good account; the breeding of silk-worms is now followed here, and premiums are assigned by the prince for the encouragement of the production of silk.

The Weser and the Leina are the principal rivers in the south part of the principality; and here also, as well as in the Hartz, flow the Innerste and Ocker: there are here likewise the Aller, and a canal drawn between Querum and Glissenrode, which is of singular advantage, and was opened in the year 1750.

The established religion is Lutheranism, and both the pastors and congregations are at present under five general superintendents. At Brunswic both the Calvinists and Papists are permitted the use of a church.

The manufactures of Wolfenbottle consist in the spinning of thread, and the weaving of linen; the making of woollen cloth, and silk stuffs, Turkey, and other sorts of dressed leather; the bleaching of wax, and making of porcelain; in lead, iron, and steel founderies. The trade of the country consists in these and other articles; as in minerals, turnery, and cabinet-makers work, with Brunswic mum, and the beer of Konigslutter.

The prince's title is only that of duke of Brunswic and Lunenburg, which he enjoys in common with the king of Great Britain; both, as hath been already observed

served in treating of Hanover, being descended from the same family.

His arms are, however, very extensive, and consist of thirteen fields: the first gules, a semée of hearts or, and a lion azure, for the dutchy of Lunenburg. The second is gules, with two leopards or, for the dutchy of Brunswic. The third is azure, with a lion argent crowned or, for the county of Eberstein. The fourth gules chequée argent and azure with a lion or, for the lordship of Homburg. The fifth or, a lion gules crowned azure, for the county of Diepholz. The sixth gules with a lion or, in chief, and four fesses of the same; but through mistake only three are marked, and these in the tenth field. The seventh is or, two bears paws expanded, for the county of Hoya. The eighth is quarterly party per fesse chequée gules and argent; underneath argent and azure girony, for the county of Bruchausen. The ninth azure, an eagle argent, which forms the lower half of the Diepholz shield. The tenth is chequée gules and argent, for the county of Hohenstein. The eleventh argent, a stag's horn gules, for the county of Reinstein. The twelfth argent, a stag sable, for the lordship of Klettenberg. The thirteenth is also argent, a stag's horn sable, for the county of Lautenberg. Among the five crowned helmets, the chief, or that in the center, has a pillar argent, crowned and surmounted with a peacock's tail, in which is a star or, and in the middle a horse argent, between two sickles reversed, and decorated in five places with peacocks feathers.

The principality of Wolfenbottle is possessed of a vote among the princes, both in the college of the princes of the empire, and in the diets of Lower Saxony; in each of which, by virtue of an agreement concluded in 1706, when the seniority lies in the house of Brunswic Wolfenbottle, it precedes those of the elector of Brunswic and Lunenburg for Zell, Grubenhagen, and Hanover; but otherwise comes after them.

The supreme college of the princes is the privy council, which has the direction of all state affairs, as also the general government of the country, laws, and ordinances, with the polity, grant of privileges, nomination of magistrates and officers of the law in the towns, and other important concerns, and here the reigning duke assists as president. The prince's revenue, and all affairs relating to it, are either under the inspection of the treasury, in which also the sovereign presides, or of the convent-office. Brunswic is the seat of the two first colleges; but the last, together with the chancery, the high court of justice, and the consistory, are held at Wolfenbottle.

The prince's immediate revenues arise from the treasury, bailiwicks, the regalia, the conventual estates, the imposts of the circle and empire, contributions, legation and fortification money, service and quotas of provisions. The lesser committee of the states, or the tax college, superintends the town-tax, land-tax, convent-tax, sheep-tax, measure-tax, tithe-tax, and mill-tax, with the excise on malt, beer, wine, brandy and stamped paper; as also the licence.

The military force maintained by the duke generally consists of four regiments of foot, each of two battalions, a body of horse-guards, a regiment of dragoons, and a militia regiment of five companies, each company containing one hundred and eighty men, with a corps of engineers and matrosses. There is also one regiment of invalids. These troops are clean, and clothed much after the Prussian manner; but their arms are lighter, and their exercise not so exact. Mr. Hanway observes, that people of distinction seldom leave this court without being extremely well satisfied with their reception, and, in particular, English noblemen are well received, when they occasionally pass that way. The duke, that gentleman observes, seems more fond of ease and happiness, than of the parade of life. He generally appears in his coach with three other persons of his family. His livery is yellow laced with a blue silk and silver galoon; behind his coach are usually four footmen; two pages in blue cloth laced with silver run by its sides, and a single servant in livery rides before to clear the way.

In this principality are ten boroughs, eight market-towns, three hundred and eighty-six villages, and seven-

teen fees and convents. The states are composed of the deans of the fees, and the priors of the convents; of the nobility who are possessed of manors within the country; and lastly, of the deputies of the eight oldest towns. The diets are held at the provincial house at Brunswic, and meet four times a year. The whole country is divided into four districts, viz. into those of Wolfenbottle, Schening, the Hartz, and the Weser.

The district of Wolfenbottle is situated on both sides the Ocker, and contains under it the following towns.

Brunswic, the capital of the dutchy, is situated in a plain on the banks of the Ocker, which runs through it, entering the town by two branches; but within it dividing into a great number, all which unite again in one stream at the issue of the Ocker out of the town. It stands in the fifty-second degree thirty minutes north latitude, and in the tenth degree thirty minutes east longitude. It is well fortified with a double wall and ditches, and on the ramparts is a brass mortar piece made in 1411, which is ten feet six inches long, and nine feet two inches in diameter. It requires fifty-two pounds of powder, and will carry a ball of seven hundred and thirty pounds weight to the distance of thirty-three thousand paces, and throw a bomb of a thousand pounds weight. In the arsenal of the city are about sixty pieces of brass cannon, several cohorns and mortars, ten pieces of large battering cannon of an enormous size, and a great quantity of small arms. The city is two miles in compass, and the ramparts planted with mulberry-trees. The buildings are for the most part in the old taste; but of late the city has been beautified with many new structures, and its streets are better paved than formerly. The prince's palace, called the Grauehof, was in 1731, the court of Elizabeth Sophia Maria, widow to duke Augustus William. That learned and pious princess erected a splendid library here, the principal curiosity of which consists in a very valuable collection of scarce and curious Bibles, or parts of Bibles, in several languages, to the number of above a thousand volumes. In this palace the reigning duke usually resides. It has rich and elegant furniture, very fine pictures, and a cabinet of curiosities. The gardens belonging to this palace are laid out in an elegant taste. In the same street with the palace is the academy for martial exercises, the cavaliers house and armoury, all new and handsome buildings.

In the Hagen market is the *Collegium Carolinum*, a noble structure, built in 1745, and founded by duke Charles, from whom it takes its name. The students, particularly those of good families, are taught all the necessary arts, sciences, languages, and exercises. In it is a good library. In the same market-place stands the opera house, which makes a very handsome figure.

The Oldburg, at present called the Mosthaus, or Mosthof, is seated on the Ocker, and before it on a high and broad pillar of free-stone stands a brass lion, which, it is said, represents one which duke Henry surnamed the Lion made so tame, that he followed him wherever he went, and after that prince's death died with grief. On the burg-platz is the new play-house. At the packhofe all goods imported or exported are rated and taxed, and this is said to produce about two hundred thousand rixdollars per annum.

In the new town is the council-house, where the magistrates meet, as the treasury board does in the council house of the old; and during the fair the passages round it are crowded with toy-shops. Near it is a chapel dedicated to a saint named Autor; but in 1681, it was assigned to the foreign dealers at the fair, for the security and more convenient sale of their goods. In Heydenstreet is the mint. The work-house was rebuilt by duke Charles, it being first formed out of an hospital, originally dedicated to the Virgin Mary. The orphan-house is an excellent foundation, and since the year 1753, has had a Latin school annexed to it, with a printing-house, and a bookseller's shop.

The Lutherans are possessed of ten churches. The cathedral of St. Blasius, which stands in the Burg-square, was erected in 1172 by Henry the Lion, on his return from the Holy Land, instead of the church of St. Peter and St. Paul, which was then falling to ruins, and annexed

nexed to it a chapter. This is an antient Gothic structure, the cieling of which is adorned with twenty large paintings, representing the prophets of the Old Testament in the clouds of heaven, which give the edifice a very solemn air. The high altar is of marble, adorned with the statues of the four Evangelists, and supported below by Moses and Aaron. In this cathedral are two fine monuments of that duke and his second consort, and here are kept the records of the electoral family and the vault of the dukes of the Bevern line. The Dutch and French Calvinists possess in common St. Bartholomew's church, but each have their respective pastor, and to the Roman catholics is assigned the church of St. Nicholas at the stone gate. The Tempelhof is an antique building that formerly belonged to the Knights Templars; but, on their suppression, passed to those of St. John, and particularly to the commandery of Supplingenburg, which in 1367 disposed of it to Kaland St. Jorgen. The dean and *camerarius* are ecclesiastics, and the two lay-members are usually magistrates: these four compose the society.

In the town are two seminaries, that of St. Martin and St. Catharine, with a school for anatomy and surgery. Here is also a college for the study of physic, instituted in 1747, and depending only on the duke and his privy-council. The lazaretto, as well as the above school and college, were built by the same munificent prince duke Charles. Here is also St. Leonard's hospital, which stands without the stone gate.

This city is well provided with a variety of ingenious artists, and has several manufactures. The first spinning-wheels were invented here in 1530 by one Jorgen, a stone-cutter and statuary. The strong beer invented by Christian Mummen, and from his name called mum, is exported to all parts, even as far as Asia. Brunswick has two annual fairs, which are very considerable ones. This city has been frequently besieged, and sometimes taken. In 1757 it was possessed by the French, who quitted it again in 1758.

At the distance of about five miles from Brunswick is the palace of Saltzdahlen, which is situated in a mean village of the same name, thus called from a considerable salt-work in its neighbourhood. The greatest part of this palace is of timber, and the rooms mostly lined with painted cloth. The great gallery of pictures is a noble apartment two hundred feet long, fifty broad, and forty high, containing above a thousand excellent pictures, several of them curious originals, by the best masters. The lesser gallery, which is a hundred and sixty feet long, and twenty broad, is likewise full of masterly paintings. Mr. Hanway, on viewing these galleries, says he was particularly struck with the following pieces: Adam and Eve viewing Abel after his death, and pulling open his eyes, by Strudel. Abraham embracing his son after the trial which God had made of his faith; piety and joy here seem to contend with each other, while his looks express a seraphic adoration: this piece is by Liebens. Peter delivered from prison by the angel, by Steinbeck. Judith and her attendant, an old woman, holding Holofernes's head just cut off, the face appearing with some signs of life. Rembrandt, his wife, and three children, in one piece, by himself. Cephalus and Procris, a very fine piece. The Ascension, which is much esteemed. Lewis XIV. and his two mistresses. Prince Eugene. The marriage of two Hollanders, the young man and woman looking tenderly at each other, while the parents are attentive to the notary who draws up the articles.

At the end of the lesser gallery to the right is a large cabinet, in which are above a thousand pieces, as plates, bottles, saltcellars, of incomparable beauty, many of them being enamels performed by Raphael Urbino, when he was enamoured with the potter's daughter. Facing the above cabinet is a large one of China porcelain, containing above eight thousand pieces, beautifully arranged. Adjoining to the large gallery are six small cabinets filled with curiosities of art and nature. The chapel here is very grand. The garden is a very fine one; but some of the statues are but poorly executed.

Near the chapel, and contiguous to the orangery, is a convent dedicated to the Virgin Mary, founded by duke Anthony Ulric and his consort, for a domina and fifteen

sisters of noble families, who perform divine service twice a day in the chapel belonging to the palace. It has also a provost, and sends a representative to the states.

Wolfenbuttle, a fortified city, seated in a low and marshy country on the banks of the Ocker. It is a pleasant place, and contains many handsome houses; besides which it is the seat of some of the head colleges of the dutchy of Wolfenbuttle, as the chancery, the chief court of justice, the bailiwick-office, the convent-chamber, the consistory, and general superintendency. Here is an antient armoury, and the castle was for the most part the usual residence of the dukes, and their library is one of the best in all Germany; it is in a particular building, finished in 1723, in the lower part of which is a riding-school. The seminary here is stiled the ducal great school. It contains several churches and other public buildings. In 1757 it was in the hands of the French, who abandoned it the next year.

Gandersheim, a small mean town seated in a valley by the side of the little river Gande, and containing a ducal seat, erected by John Julius, with a bailiwick-house, and a Latin free-school. But it is most famous for the imperial, ducal, free, and secular foundation of St. Anastasius and St. Innocent, founded in the ninth century. This abbey is at present Lutheran, and composed of an abbeys, a dean, and eleven canoneses. These have no particular dress, but wear a cross of the order enamelled black and red, on which is represented the instruments used at our Saviour's crucifixion. On the top of it is a cluster of diamonds, and at the bottom a death's head enamelled white. This cross is fastened to a broad watered ribbon of a pale blue, diversified on the edges with narrow black stripes, and hanging from the right shoulder down below the waist to the left. To this celebrated foundation also belong eight canons and capitulars. The dukes are patrons and protectors of the abbey, though the abbeys has both a seat and voice in the diet of the empire and among the prelates of the Rhine. The abbey is possessed of four hereditary bailiwicks, and to it belong the adjacent convents of Brunshausen and Claus.

SECT. XXVII.

Of the Principality of HALBERSTADT.

Its Situation, Extent, Produce, Rivers, and Towns: the Religion and Trade of the Inhabitants: their Government, the Revenues of the Sovereign, and a Description of Halberstadt its Capital.

THE principality of Halberstadt is surrounded towards the east by the principality of Anhalt and the dutchy of Magdeburg, and towards the west by the dutchy of Brunswick and the bishopric of Hildesheim, extending from east to west about forty-two miles, and from north to south thirty-three.

The country is for the most part level, but contains some eminences. The soil is extremely fertile, both in grain and flax, and has rich pastures and meadows, whence the inhabitants subsist by grazing, and their large breed of sheep affords plenty of wool. But, on the other hand, the woods are continually lessening, and the want of fuel is so great, that they are obliged to import turf for the use of the poor. The country has not a sufficiency of game and fish; nor is there a river of a considerable size in the whole country: the principal is the Bode, or Bud, the Selke, and the Ilse.

In this country, including the county of Regenstein and the lordship of Derenburg, are ten towns, and ninety-nine small country towns and villages. The inhabitants are said to amount to upwards of two hundred thousand.

The greatest part of the inhabitants are Lutherans, and their churches are divided into eleven inspections, over which is a general superintendency. The Calvinists and Papists are pretty nearly of an equal number, and the Jews are tolerated, but are not to exceed a fixed number of families.

The woollen manufactures established in this country are in a thriving condition, and its exports principally consist of grain.

It enjoys a vote among the princes, both in the diet of the empire and that of the circle. On its devolving to the house of Brandenburg, it was placed both in title and arms before any of the other principalities. Its arms are party per pale gules and argent.

The annual revenue arising to the sovereign from this principality, and the incorporated counties and lordships, including likewise the county of Wernigerode, amounts to about five hundred thousand rixdollars. For the more convenient levying the imports and assessments, the principality is divided into six circles: the principal town is

Halberstadt, the capital of the principality, is seated on the river Hotheim, in the fifty-second degree seven minutes north latitude, and in the eleventh degree fifteen minutes east longitude. It is a well built town, the streets are pretty straight and uniform, and many of the buildings are handsome, though they are generally old-fashioned. In the year 1752 the walls which surround near half the city were pulled down, and the moats filled up so as to form a level, which has been converted into a plantation of mulberry-trees. The inhabitants do not much exceed thirteen hundred, though within and about the town are sixteen churches. The cathedral of St. Peter is an old but stately building, consisting of a very hard free-stone. The chapter is composed of a provost, a dean, a senior, sub-seniors, and sixteen canons, four of whom are of the Romish religion, and all the others Lutherans. In 1754 the king of Prussia conferred on the chapter a cross of gold, enamelled with white, and divided into eight points: in the center on one side is the Prussian black eagle, and on the other the image of St. Stephen. This cross is fastened to a deep scarlet ribbon, bordered with black. On St. Peter's-square, which is very spacious, stands the priory and a monastery, the latter of which was rebuilt in 1754, with some handsome houses for the canons and prebendaries. Fronting the cathedral is the Lutheran collegiate church of our Lady: to them also belong the collegiate churches of St. Boniface and Maurice, and St. Peter and Paul; St. Martin's, to which the general superintendency of the principality is annexed; St. John's, the hospital or church of the Holy Ghost; and St. Elizabeth's. The German Calvinists are possessed of St. Peter's chapel, and the French Calvinists have a church. The Papists are possessed of three convents of monks and two nunneries, to which must be added the chapel of the voluntary poor; the Jews are also allowed a synagogue. This town is the seat of all the state courts and offices; it has three public Lutheran schools, which are those of the cathedral, St. Martin's and St. John's, and an orphan-house. In 1758 Halberstadt was very severely treated by the French, who demolished its gates, and also its remaining walls for eight hundred rods in length.

Before we conclude this account of Halberstadt, it will be necessary to observe, that the county of Ragenstein, or Reinstein, antiently formed but one county in conjunction with Blankenburg, the counts of Reinstein and Blankenburg being derived from the same stem. The former at present, however, belongs to the elector of Brandenburg, who retains it as a fortified fief of Halberstadt, notwithstanding the demands of the house of Brunswick-Lunenbourg relative to a restitution of a part of the county which the counts of Tattenbach had held as its fiefs; and this has given rise to a process said to be still depending before the aulic council. Blankenburg was, in 1707, erected by the emperor Joseph into a principality, and since the year 1731 has belonged to the reigning house of Brunswick-Wolfenbuttle.

S E C T. XXVIII.

Of the Bishopric of HILDESHEIM.

Its Situation, Extent, Produce, and Rivers; the Religion of the Inhabitants, their Manufactures, Government, and principal Towns.

THE diocese of Hildesheim is encompassed by Hano-
ver, Wolfenbuttle, Grubenhagen, Halberstadt, and Lunenburg, terminating also on the county of Wernigerode. Its greatest extent from east to west is about

forty-seven miles, and from north to south somewhat above thirty-eight.

The greatest part of this diocese consists of a good soil fit for tillage, and that yields a great quantity of flax and hops, with garden plants and roots; but it affords only a sufficiency of horses, cows, sheep, and hogs, the south part is hilly, and for the most part covered with fine woods of oak, beach, ash, and birch. Such mountains as are bare contain valuable quarries, and also iron ore; in consequence of which some iron founderies have been built. There are likewise some good salt-works in this part; but these are not sufficient to supply the diocese.

The Leina traverses the western part, and at Ruhte is joined by the Innerste. The Fulse rises here, and runs into the principality of Lunenburg. The Ocker traverses the eastern part of the diocese, and, after receiving the Ecker, enters the principality of Wolfenbuttle: but, notwithstanding their having these rivers, fish is scarce.

At the time of the Reformation the greatest part of the diocese belonged to the duke of Brunswick-Lunenbourg, who after taking it from bishop John, when under the ban of the empire, obtained the investiture of it. These dukes were indeed so far from promoting the reformation in these parts, that they obstructed it to the utmost of their power; yet almost the whole country soon made an open profession of Lutheranism. The lesser see did the like, and the bishops granted the vassals freedom of religion; but, in the beginning of the thirty years war, the Lutheran ministers were driven out of the lesser bishopric of Hildesheim, and the Lutheran churches in the greater as much oppressed; but the dukes of Brunswick and Lunenburg having, by a convention in 1643, ceded the latter to the bishop, it was stipulated that the Lutherans should at certain times, and under certain limitations, enjoy the free exercise of their religion; but at length religious liberty was settled on a solid and lasting foundation. Of the Lutheran religion are all the towns, with the greatest part of the nobility, and most of the villages; but the sovereign, with the cathedral chapter, the convent, almost all the episcopal officers, a part of the nobility, and many persons both in the towns and country, are Roman catholics. The lesser bishopric, as it is called, has no Lutheran superintendency; but in the greater there are no less than four.

This diocese has but few manufactures, and these are of good linen, ordinary woollen cloth, worsted stockings, a coarse porcelain, with all kinds of iron-wares. Its exports consist of corn, sheep, wool, hops, salt, thread, and linen.

The arms of this see are party per pale gules and argent.

The bishop of Hildesheim sits in the diet between the bishops of Augsbourg and Paderborn, and votes among the princes in the diet of Lower Saxony. The cathedral chapter consists of forty-two members, who elect the bishop, and on a vacancy of the see take the reins of government into their own hands. The chapter is also the first state of the diocese, and is possessed of very considerable revenues.

The bishop, who is generally absent, leaves the government of the country to a stadtholder and privy council. The administration of justice is committed to the chancery of the regency, and the chief tribunal; but the former alone takes cognizance of criminal causes. From both these courts, an appeal lies to the Aulic council: in like manner causes are carried from the towns to them.

The spiritual jurisdiction over those of the Popish religion belongs to the bishop's official, and the Lutheran subjects, by the peace of Westphalia, have also their consistory, which is composed of two ecclesiastical, and and two lay counsellors, who must be Lutherans, and to these are added a secretary and clerk of the same religion. The chancellor of the regency, or, in his absence, a state counsellor, represents the sovereign, and is possessed of the first seat and voice; but his vote does not extend to certain cases, in which, on account of the difference of religion, he cannot act as judge. The consistory is usually held but eight times a year.

The episcopal revenues are under the direction of the treasury, and arise from the domains and regalia, exclu-

five of the sums annually granted by the diet. Here is also a tax-office for this country, into which are paid the contributions, with the land-tax, measure-tax, village and sheep-taxes.

The whole military force of this see consists only of one company of foot, as a garrison to the town of Peina, and a few troopers. In the diocese are eight boroughs, with four market-towns, and two hundred and forty-eight villages. In 1731, the nobility were reckoned to have seventy-five manors, the proprietors of which are admitted into the assemblies of the nobility, and qualified for the diet.

The states of the country consist first of the cathedral chapter; secondly, of the seven abbeys; thirdly, of the nobility; and fourthly, of the towns of Hildesheim, Peina, Elze, and Alel. The sovereign alone convenes the diets, which are generally held in the beginning of the new year, in the nobles hall at Hildesheim. They are opened by the bishop's chancellor, and a secretary reads over his proposals, on which each class returns thanks in the person of its syndic, with assurances that the proposals shall be taken into consideration, and a proper answer returned.

The principal places in this diocese are the following:

Hildesheim, in Latin Hildesia, is the capital of the diocese, and stands on a rugged declivity, near the Innerste, in the fifty-second degree twenty-six minutes north latitude, and the ninth degree fifty-one minutes east longitude. It is pretty large, but old and irregularly built. The magistracy, with the greatest part of the burghers, are Lutherans; but the rest of the popish religion. The cathedral, which belongs to the latter, is richly ornamented, particularly with fine paintings, and among its antiquities is the idol Irmenful, which stands fronting the grand choir. Over the cross-way is the nobility hall, which is finely painted in fresco; here is

also the place where the diet is opened, together with the chapter-room, the treasury, and a library. Near the cathedral stands the chancery, which was once the residence of the bishop; but at present of the stadtholder. The cathedral yard, in which several of the canons have their dwellings, is planted with rows of trees. In the same place also stands the Jesuits college, which besides its other ornaments, is remarkable for its fine hall. The seminary, which belongs to it, consists of nine classes. Holy Cross abbey is also a noble edifice, that has a splendid church. Here are two convents of Benedictine monks, a Carthusian monastery, with another for Capuchins, and two nunneries. The Lutherans are possessed of eight parish churches, the principal of which is that of St. Andrew, in the Old Town. There the superintendent resides, and in that also is the *Gymnasium Andreanum*, a large elegant structure, which contains a good library. The church was once collegiate, but on its being ceded to the Lutherans in 1542, the deans and canons were removed to the Liberty, where they still reside, and hold their meetings every year. The Latin school of St. Lambert is under the direction of four masters. The Jews have a synagogue here. This was anciently one of the Hanse towns; but the calamities it suffered by war in 1632 and 1634, in both which years it was besieged and taken, have been of irreparable prejudice to it.

Peina is situated in a marshy country on the Fulse, and was formerly reckoned among the fortresses. The greatest part of the inhabitants are Lutherans; but the patronage of the Lutheran town and parish church, is lodged in the bishop. This garrison consists of one company of foot, who are in the bishop's pay. In a corner of the town, stands the episcopal palace, with a Capuchin convent, and near them is a suburb called the Dam, chiefly inhabited by shop-keepers and Jews.

CHAP. XIII.

Of LUSATIA.

SECT. I.

Of the Situation, Extent, Produce and Rivers of Lusatia in general; with the Religion, Learning, Manufactures and Commerce of the Inhabitants.

LUSATIA, which some authors place in Austrian Silesia, and others in Saxony, extends in length from the north-west to the south-east, and is bounded on the east by Silesia, on the south by Bohemia, on the west by Misnia, and on the north by Brandenburg. It is five hundred and seventy miles in compass, and is divided into the marquisates of Upper and Lower Lusatia. The former abounds more in mountains and hills, and enjoys a purer air than the latter, in which are found many boggy and moorish tracts; but has a great number of woods, and those finer ones than are to be met with in Upper Lusatia, where the fertile tracts of that country have a great scarcity of timber. In the mountainous tracts of Upper Lusatia, on the borders of Bohemia and Silesia, is but little room for agriculture. The heaths on the confines of Lower Lusatia consist of a poor soil, which are of but little use except for hunting.

In each of these marquisates wheat, rye, barley, and oats are cultivated; as also much buck-wheat, together with peas, beans, millet, lentils and flax. With respect to orchard and garden fruits, as also to the culture of hops, tobacco, and wine, Lower Lusatia has greatly the preference. The inhabitants also make some white and red wine. However, the produce of this country is not sufficient for the supply of the people, and therefore corn, fruit, hops, garden stuff and wine, are imported into the Lusatias. The breeding of cattle is very confi-

derable; there is also no want of venison, and the rivers, lakes, and ponds yield a variety of fish.

Here are quarries of stone, and in the mountains are dug crystals, agates, and jaspers. This country has also an allum-work, and a vitriolic and copper water, and in several places is found very good iron-stone.

In the Lusatias rise the river Spree, the Schwartzelster, and the Pulsnitz; and the Neisse, which rises in Bohemia, has its course chiefly in Lusatia, where it receives several small rivers, and below Guben discharges itself into the Oder.

Some sparks of the Christian religion were scattered here in the seventh century; but several hundred years passed before the people could be brought under the Romish church, and the compulsion employed on that occasion must necessarily have exasperated them, while it rendered numbers of them hypocrites. However, from the eleventh century, many convents and churches became erected in the country. The doctrines of Luther were here received so early as the year 1521, and spreading by degrees, became the prevailing church, as it continues even to this day. There are, however, several popish convents, churches, market towns, and villages, scattered through the country.

Learning is much esteemed in both marquisates, which have produced many persons who rendered themselves illustrious by their literature. In the thirteenth century the gross ignorance in which this country was involved began to vanish, and from the year 1450 to the Reformation, it still increased, men of learning arriving from foreign countries, who brought books and the sciences along with them, and by these the schools were improved. Learning, however, was not thoroughly established till after the Reformation.

Lusatia would be unable to support its inhabitants without the assistance of the arts ; but the numerous woollen and linen manufactures afford the inhabitants all the necessaries of life. These flourish principally in Upper Lusatia, and in several towns cloth manufactures have been carried on so early as the thirteenth century, and by this means have raised those towns to a flourishing state. The cloths of Lusatia are of different kinds, and the best of them little inferior to those made in Holland. Prodigious quantities of stockings, spatterdashs, caps and gloves are also made here. The conduct of the emperors Ferdinand the Second and Third, together with that of Leopold towards the Protestants in Bohemia and Silesia, caused vast numbers to retire to Upper Lusatia, where they erected villages chiefly in the mountains, and generally employed themselves in the weaving of linen. Hence there are made here all sorts of linen from unbleached and bleached yarn common and fine, as also fine white damask and white ticking. Various sorts of coloured and printed linens are made here, and there are likewise in Lusatia good manufactories of hats, leather, paper, gun-powder, iron, glass, and the bleaching of wax.

By means of these manufactories a considerable trade is carried on, which though not so great as formerly, exceeds the value of the importation in silk, wool, and yarn, employed for their manufactures, and of the foreign silks, gold and silver lace, wines, spices, corn, fruit, garden stuff, and hops, brought into the country.

The marquises of Upper and Lower Lusatia are remarkably different with respect to their arms, constitution, and government.

SECT. II.

Of the Constitution, Government, Arms, and principal Places in Upper and Lower Lusatia.

THIS marquise contains two sorts of states, viz. those of lands and towns. The land-states are divided into, first, the state-lords, who have all their vassals and proper judicatories; secondly, the prelates, as the dean of Budissin, the abbess of Marienstern and Marienthal, and the prioress of Lauban. The king of Bohemia has the supreme right of protection over the catholic foundations, cloisters and clergy, in both marquises; but this extends only to religious affairs; they being in every thing else subject to the government of the country; and the dean of Budissin with the cloysters of Marienstern and Marienthal perform homage to the elector of Saxony. The third division of the land-states consists of the gentry and commonalty, as counts, barons, nobles and burgeses, possessors of knights fees and fiefs.

The second class of the state consists of the immediate seignioral towns, called by way of eminence The Six Towns, which are ranked in the following order, Budissin, Gorlitz, Zittau, Lauban, Camenz, and Lobaw.

These two states, in all consultations relating to the common concerns of the country, form two voices, viz. the states of the country one, and the united six towns the second. They also assist in drawing up all such resolutions and regulations as have a relation to the common benefit and welfare of the country; and without first obtaining their opinion and free consent, no taxes can be laid, nor any thing done that clashes with the constitution of the marquise.

These states assemble at the land diets, which are either ordinary or extraordinary; the first are held three times a year at Budissin, and the last only upon extraordinary occasions.

The arms of the marquise of Upper Lusatia are a wall or, streaked with black, and erected in the manner of battlements in a field azure. In the shield it bears an helmet crowned, on which stands the wall or, with two eagles wings azure.

The arms of the marquise of Lower Lusatia are, an ox gules in a field argent, which stands from the left to the right.

All Lusatia was formerly a part of Bohemia; but re-

belling against the emperor in 1620, John George elector of Saxony reduced it; for which service, by the treaty of Prague in 1635, it was settled on the elector of Saxony, except some parts of Lower Lusatia, which were left to Brandenburg.

The marquise of Upper Lusatia is divided into two circles, and to each of these belong inferior circles; the principal towns in which are the following,

Budissin, or Bautzen, is the capital of the whole marquise, and is reckoned the first of the six towns. It stands in a mountainous situation, on the banks of the Spree, and is fortified in the antient manner. It is considerably large, well built and populous. The castle of Ortenburg, which stands on a high rock, is separated from the town by a ditch and rampart, and yet is within the town walls. There is here a cathedral church dedicated to St. Peter, half of which belongs to the Lutherans, and the other half to those of the inhabitants, who are of the Romish church. Budissin has likewise a separate church belonging to the Lutherans, and another to the Papists; besides which there are three hospitals, with a church belonging to each. The other buildings are a council-house and the council library, a celebrated academy, and an orphan-house. This town carries on a considerable trade in linen, hats, stockings, gloves, manufactures of Turkey and glazed leather, cloth, fustian, &c. It has frequently suffered by fire, and has been sometimes entirely burnt down.

Gorlitz, the principal town of the circle of the same name, and the second of the six towns, is situated on the Neisse, in the fifteenth degree seven minutes east long. and the fifty-first degree ten minutes north lat. 20 miles to the east of Budissin, and is built and fortified in the antient manner. Within its walls are three churches, a celebrated academy, an orphan-house, and the bailiff's seat, in which the knights of this circle meet once a year. Without the walls are three churches, an hospital, and what is called the Holy Sepulchre, built after the model of the Holy Sepulchre at Jerusalem. The cloths made in this place are beautiful, but the trade in this article is not near so considerable as formerly.

Zittaw is one of the best towns in Lusatia; it is fortified in the antient taste, but finely built, and carries on a considerable trade in cloths, linen, and blue paper. It contains within its walls two churches, an hospital, a library, a good academy, and an orphan-house; but without there are three churches, which are only used for funeral sermons, and three hospitals, in one of which is a chapel.

Herrenhuth, a famous place in the circle of Zittaw, first founded in the year 1722, by some Moravian brethren, who settled there in the fields of the village of Berthelsdorf, belonging to the late count Zinzendorf; but were afterwards greatly increased, and this place became the chief nursery of the Herrenhuthers, who considered count Zinzendorf as their bishop and father.

The states of Lower Lusatia are also divided into land and town-states. The former consists of the prelates, the lords who are possessors of seigniories, and the knights, to which class belong the counts, barons, and nobles, possessors of knights fees and fiefs. The town estates are composed of the deputies of the four circle towns Luckaw, Guben, Lubben, and Kalaw.

Each circle holds in its circle town a circle assembly, under the inspection of the land-elders. The states of the country constitute the lesser and greater ban, who, in weighty affairs, and cases requiring dispatch, assemble with the privity and approbation of the upper office. The land-diet here hold two annual voluntary diets. But when the superior causes the states to be summoned together at his discretion, and proposals to be laid before them by commissaries deputed for that purpose, such convention is called a great land-diet.

The principal towns in Lower Lusatia are,

Soraw, or Zarow, one of the most antient towns in all Lusatia, has a pretty strong castle, to which belongs a church, a pleasure-garden, and also a good school. It has five other churches, and is the seat of the chancery and consistory. The town has been several times almost destroyed by fire; and near it is a hunting seat and a park.

Luckaw, which is esteemed the capital of Lower Lusatia, is seated on the rivulet of Geila, and contains a Latin school, a parish church, a cloyster church, a house of correction and poor-house founded in the year 1744, with another church, and two hospitals. In 1644 and 1652 it was demolished by fire.

Guben lies on the Neisse, which below it falls into the

Oder. It is a pretty large town, and, besides two parish-churches, has an hospital, which has likewise a church, a burying-church, a Latin school, and a salt-office. Four villages which belong to it have some good manufactures of cloth, and there is here made a pretty deal of good wine.

C H A P. XIV.

Of the Circle of BAVARIA, including the Electorate of BAVARIA, the UPPER PALATINATE, and the Archbishopric of SALTZBRUG.

S E C T. I.

Of the Circle of Bavaria in general, and more particularly of the Electorate of Bavaria; its Extent, Produce, and Manners of the Inhabitants, their Religion, and Government; with the Title and Arms of that Electorate; and the Bavarian Order of St. George.

THE circle of Bavaria is surrounded by the circles of Swabia, Austria, and Franconia, and by the kingdom of Bohemia, and derives its name from the duchy of Bavaria, which is the largest and most considerable part of it.

Of this circle the elector of Bavaria and the archbishop of Saltzburg are joint summoning princes and directors, the convocatory being likewise held jointly by them; but the *directorium* is alternate. The diet of the circle is most usually held at Ratibon, or Wasserburg, though it is sometimes convened at Landshut, or Muldorf. The elector of Bavaria is hereditary commander in chief of the circle, by virtue of which office he has the direction of all military affairs.

We shall begin with the electorate of Bavaria, which contains the principal part of the circle, but it is not easy to ascertain with any degree of exactness the proper extent of this electorate; for maps themselves differ with respect to its greatest length and breadth. Bavaria is, however, according to The Present State of Germany, a hundred and thirty miles long, and one hundred broad.

Upper Bavaria is partly mountainous and woody, and partly marshy, abounding also in large and small lakes, and is in general fitter for pasturage than tillage; but Lower Bavaria, which is for the most part level, is more fruitful: however, this electorate in general abounds in grain, pasture, fruits, woods, and forests; producing also a great number of cattle, and plenty of game and wild-fowl. It has some salt-works, and a mine of silver, another of copper, and one of lead; and in several places are quarries of very fine marble. The Upper Palatinate is extremely mountainous; but it is covered with woods, and has plenty of grass, and, where cultivated, produces corn. The country is able to support its inhabitants, particularly by means of the great number of its iron and lead-mines, its large woods and pastures.

The principal river in this country is the Danube, which issuing out of Swabia waters the electorate from west to east. The large inland lakes are said to be sixteen in number, and the small ones a hundred and sixty. The rivers, lakes, and ponds abound in fish, particularly the numerous ponds in the Upper Palatinate, which have an uncommon plenty.

In all Bavaria are reckoned thirty-five towns, and ninety-five open and enclosed market-towns. In the several bailiwicks are upwards of a thousand castles and seats, and there are said to be in Bavaria eleven thousand seven hundred and four villages and hamlets.

Though the Bavarians are esteemed rude, and are called by the other Germans Hog-drivers, they are found to be as hospitable and courteous as their neighbours. The people are in general poor, and their clergy suffer them to continue in the most deplorable ignorance with respect to religion, their adorations being principally paid to

saints and images. They are said to be far more superstitious than the Swabians; for in almost every town some bone or relic is held in higher veneration than the welfare and honour of their country: yet they are more polite and ingenious than the people of Swabia; and though they cultivate the sciences, they are more addicted to arms than to arts, and make good soldiers.

The states of Bavaria consist of three classes, the prelates, the knights, and nobility; to which also belong the counts and lords, and the burghers of the several boroughs and market-towns. Provincial diets are here very rare, but a committee of the states assemble annually at Munich, or as often as the state of affairs requires.

No other religion is tolerated here but that of popery. The Lutheran and Calvinist doctrines had indeed obtained a superiority in the Upper Palatinate; but that country falling into the hands of the elector of Bavaria, popery was restored by force. There are, however, a great number of Lutherans still. The parishes in the electorate amount to about fifteen hundred. The vicarages, chapels of ease, and other chapels, are near two thousand in number, and the churches are said to amount to twenty-eight thousand seven hundred and nine. These churches are subject to seventy-one rural deans. There are likewise eighty-six remarkable convents, and twelve collegiate foundations. Manufactures are here greatly increased and improved, particularly those of silk stuffs, velvets, tapestry, coarse cloth, woollen stuffs, and stockings, very good clocks, and watches; but its chief exports consist of cattle, grain, wood, salt, and iron.

The titles of the elector are, By the grace of God duke of Upper and Lower Bavaria, as also of the Upper Palatinate; palgrave of the Rhine, arch-steward of the holy Roman empire, and elector and landgrave of Leuchtenberg.

The arms of the elector are quarterly, an escutcheon of pretence. In the last of these quarters is the imperial monde or, in a field gules, denoting the office of arch-steward of the empire: in the upper dexter and lower sinister quarter are lozenges azure, and argent for the duchy of Bavaria; and in the upper sinister and lower dexter is a lion gules crowned or, for the palatinate of the Rhine. During an interregnum, when the elector of Bavaria exercises the vicariate of the empire, he is allowed to bear the imperial spread-eagle, with his family shield on the breast.

The Bavarian order of St. George was revived in 1729 by the elector Albert. The knights of this order are stiled Defenders of the immaculate conception of the blessed Virgin Mary, and must produce unquestionable proofs of the nobility of their ancestry for eight generations in both lines. The elector is grand master, and its ensign is a cross enamelled blue, with a St. George in the middle; on the reverse of which is the name of the restorer of the order in a cypher, surrounded with the electoral cap, and at the four angles these letters I. V. P. F. signifying *Iustus velut palma florebit*, that is, "The righteous shall flourish, like a palm tree." This cross is wore pendant to a broad sky-blue ribbon with a black and white border.

In the electoral college the elector of Bavaria has only the fifth seat, though he is the second of the lay electors; he

he is not only a member of the college of princes, but has even the first seat and vote in it.

The revenues of the elector arise out of salt, beer, wine, brandy, oak-mast, venison, wood, mines, excise, coinage, tolls, contributions, and other ordinary sources; besides the imposts raised on extraordinary occasions. His ordinary annual revenue is estimated at between five and six millions of guildens.

The elector's military force consists of regulars and militia; the former of these in times of peace usually amount to about twelve thousand; but in war they have been augmented to twenty-five, and even to thirty thousand.

SECT. II.

A Description of the principal Places in the Electorate of Bavaria, particularly of Munich the Capital, with a Description of the Palaces of the Elector, and of whatever is most worthy of Notice.

WE shall now describe the most remarkable places in Bavaria, in which we shall mention whatever deserves the notice of the curious.

Munich, in Latin Monachium, is a fortified city seated on the Iser, in the forty-eighth degree twenty-two minutes north latitude, and in the eleventh degree forty-one minutes east longitude. It is the capital and residence of the elector, and has broad streets extending in a direct line, adorned with a multitude of noble edifices of all kinds. The palace and other buildings belonging to the elector, together with the churches, sixteen monasteries, and other religious structures, take up near half the city. The precinct of the Augustines alone consists of several streets, which bring them in an annual rent of three thousand guilders.

The elector of Bavaria's palace is an elegant structure, consisting of four courts, the two finest of which are called the Prince's and Emperor's Court; the former is adorned with several brass statues: in the latter a broad flight of steps of beautiful red marble leads to the emperor's hall, which is a hundred and eighteen feet in length, and fifty-two in breadth; and in it is, among other things, a statue of Virtue of one single piece of porphyry. In the chamber of antiquities are two hundred marble statues and busts of Roman emperors, with five hundred antiques, as lamps, inscriptions, basso relievos, &c. most of which were brought from Italy.

Among the valuable curiosities in the treasury is a cabinet of many large pieces of work in crystal, among which is a ship some spans long, with a pilot, and all the tackling of the finest gold. A hill, with a castle upon it, all of oriental pearls. St. George on horseback of red agate, with his armour of diamonds set in gold; and the Bavarian family, each person cut out of a piece of blue chalcedony. A double brilliant diamond of the size of a middling nutmeg. A larger, which cost a hundred thousand guilders. A set of buttons and loops of diamonds and rubies set between. A set only of diamonds, the buttons of extraordinary beauty, not inferior to those worn by Lewis XIV. when he gave public audience to the Persian ambassador, and of a superior lustre to the French; the late elector having been twenty years, with great difficulty and incredible expence, in completing the collection. An ivory closet, with figures in relievo of most curious workmanship, in which are preserved eleven hundred and forty-four gold Roman medals. In the year 1729 the palace, and particularly the chamber of rich curiosities, suffered greatly by fire, and in 1750 a whole wing of it was burnt down. Towards the east stands the elector's arsenal, and to the northward lie the park and pleasure-gardens, near which is a large edifice for tournaments.

On the west side of the palace, and opposite to it, stands the fine house built by count Preising, master of the horse, which is a great ornament to the city, its four sides answering to so many streets. The pillars of the stable are of red marble, and every horse feeds out of a marble manger, that cost twenty-five guilders.

In this part is another palace built by duke William. In the largest market-place is a lofty marble pillar, upon which stands a brass statue of the Virgin Mary: there are here also two large fountains, and on the sides of the market-place is the town-house, in which the states hold their meetings, together with several lofty houses ornamented with decorations of paintings on the front.

The principal ecclesiastical buildings are the collegiate church dedicated to the Virgin Mary, in which is the magnificent monument of black marble of the emperor Lewis IV. of Bavaria, adorned with six large and several smaller statues of brass. About ten or twelve paces from the entrance of the great door, one of the stones of the pavement is marked with a double cross, and a person standing upon this stone finds the pillars of the church so placed as to intercept the view of all the windows.

Among the other ecclesiastical buildings, the most remarkable is the church of St. Peter, with the convents of the Augustines, Capuchins, Carmelites, Franciscans, and Theatines; as also the Jesuits college, in which is a valuable library: both their convents and church are exceeding fine, and the last very large, light, and lofty. The vestry is very rich, and among their relics they shew a joint as big as that of an elephant, which they pretend was one of the joints of St. Christopher's backbone. The other buildings worthy of notice are the nunneries of St. Clara, Bridget, and Ridler; the residence of the English society; the hospital of the Holy Ghost, of St. Elizabeth, or the Duke's, and St. Joseph.

They have no religion but that of the Roman, to which they are so bigotted, that they look upon those of another persuasion as monsters rather than men; and among the festivals performed here, the procession at that of *Corpus Christi* appears very extraordinary. Here march the deputies of all the trades and manual arts, with costly flags carried before them. Every member of all the religious orders join in the procession; and a great number of religious histories are exhibited on triumphal cars, by children richly dressed. At the head of their respective orders ride St. George and St. Maurice, in Roman habits; while St. Margaret is represented by a young lady, dressed like a vestal, leading after her a large dragon, in which two men are usually enclosed to give it the necessary movements. The four mendicant orders precede the host, which is carried under a splendid canopy; after which come the elector and his consort, both holding a lighted taper. They are followed by the master of the household, some court ladies, and after them the whole court. The procession is closed by the garrison, burghers, and peasants; and, while the clergy stop at four different places to give the benediction, they are answered by salutes of eight guns from the ramparts.

On the other side of the river Iser lies Au, the remarkable places in which are the house of duke Albert, with its chapel, and the elector's manufactory. Above this place stands a convent belonging to the order of St. Paul. In Munich are manufactures of velvets, silk, wool, and tapestry.

At the distance of nine miles from Munich is Schleim, an elegant palace belonging to the elector. The entrance is very grand, both the pavement and the columns being of red and grey marble; and the stairs are adorned with columns of green marble, brought from Brixen. In the first hall are two large paintings of the raising of the siege of Vienna, and the battle of Hagaz; and in the victory hall, which is contiguous to it, are the battles of Belgrade, Pest, and several others. On the side of the palace towards Munich is a noble gallery of pictures, among which are two pieces of Annibal Caracci, for each of which Maximilian, the first elector of the Bavarian; family paid forty thousand guilders, and several large hunting-pieces by Rubens. In another chamber is the slaughter of the innocents at Bethlehem, finely painted by Peter Paul Rubens; in which the various agitations of the mothers supplicating, lamenting, struggling, and fainting, are incomparably expressed. But the grandest collection is in a particular apartment, covered with small pictures; nothing has a place there, but what is esteemed among the noblest productions of that art. In another chamber is Alexander's

first battle against Darius; a most admirable piece, painted by Albert Durer, who has bestowed incredible labour on it: it contains several thousand men, yet the hair of their heads and beards, with the smallest joints of their armour, and other minutiae, are all distinctly expressed.

At the distance of half a league from Munich is the palace of Nymphenburg; which has not the grandeur of Schleissheim; but its fine gardens and water-works render it a more agreeable summer residence. In some of the apartments are portraits of the beauties of the French court, views of several palaces of this duchy, likewise a chimney-piece and two tables of white marble inlaid with gold, and colours, in imitation of enamel. In the garden is a grand cascade and basin, with several figures of brass gilt. Among the fine walks and trees of this garden stands Badenburg, a delightful structure, consisting of elegant grottos and a large bath, into which both cold and warm water may be conveyed. The floor is overlaid with copper, and the wall decorated with porcelain and conduits. Along the roof is an iron lattice, partly gilt, and of very curious workmanship.

Opposite to this place is the mall, and the bowling-green, by which stands a structure called Pagodenburg, the chief use of which is for the elector, after violent exercise at those games, to change his linen, and other apparel. Here are also several little cabinets in the Chinese taste, and other contrivances equally ornamental and convenient.

Nearer the palace stands a pretty hermitage, which is so natural an imitation of a ruinous building, that it never fails to raise the beholder's admiration. In some places it seems as if endeavours had been used to repair it with lime and stone; in another part you are afraid that the cracked walls and the bricks, which scarce hang together, will immediately give way and crush you in the ruins. In this structure, which stands in a kind of desert, is a large grotto, in which is a consecrated altar, and on it a crucifix, and two candlesticks. The other rooms have no other ornament but a small library of books of devotion in French bindings. Underneath is a kitchen and cellar, where the utensils are only a neat sort of earthen ware.

At the distance of nine miles from Munich also lies another electoral seat, called Starnberg, where the court sometimes takes the diversion of water-hunting. A stag is forced into a neighbouring lake, the hounds pursuing him, followed by the huntsmen in boats, and their highnesses in a splendid barge, which carries twenty-four brass guns.

The court here also often take the diversion of hunting the heron, and every year at the conclusion of this sport, an heron that has the good fortune to be taken alive, is set at liberty, with a silver ring put on its leg, on which is engraved the name of the reigning elector. Mr. Keyser mentions one of these birds being taken a second time, that had on its ring the name of duke Ferdinand the present elector's grandfather; so that it had survived its former adventure above sixty years; they put a ring with the present elector's name on its leg, and restored the bird to liberty a second time. Upon this occasion the same author mentions an eagle that died at Vienna in 1719, after a confinement of one hundred and four years; and adds, that it is probable that these and the like birds in the enjoyment of their natural freedom reach to a much greater longevity.

Ingolstadt is a fortified town, pleasantly seated on the Danube. It is of an indifferent size and strength, with broad, straight, and well paved streets. The houses are mostly painted white on the outside; but the town is poor and ill peopled. It contains an upper and lower parish church, together with three others, a college of Jesuits, two convents of monks, and one of nuns, and an university founded in 1472, and enlarged in 1746, in which is a good library, and a cabinet of antiquities. This town was besieged by the Swedes in 1632, without success; but was taken by the Austrians in 1743.

Reichenhall, a town seated on the Sala, with a rich salt spring in it, the water of which is partly boiled here, and partly by means of a wheel, thirty-six feet in

diameter, thrown up to the higher parts of a lofty house, and from thence conveyed by means of leaden pipes to the distance of three German miles to Trau-enstein, and there boiled; the latter of these places abounding much more in wood, and having greater conveniences for exportation. On the mountains over which these pipes run are small houses and water-works at proper distances, in order to throw the water higher. Near the salt spring is a stream of fresh water, by the swift current of which their wheels and water-engines are worked; but as both springs are surrounded with hills, and the place in danger of being overflowed by the conflux of these waters, an aqueduct was undertaken above three hundred years ago, and completed at a prodigious expence. This is, indeed, a work that cannot be beheld without amazement; its channel runs under the town of Reichenhall, and under several gardens and fields at the depth of twelve fathoms in surface, and is a mile and a half in length to the place where the water breaks out to day-light, with great impetuosity. One passes through this aqueduct, says Mr. Keyser, within a quarter of an hour in boats by candle-light, and the motion is so rapid, that the boat must often be checked. The water is usually between three and four feet deep; but is frequently swelled by the rains, so as not to leave room for the passengers in the boat to sit upright. This canal is five feet broad, and every eight or ten years the bottom is cleared of the stones carried thither by the floods or fresh water, or wantonly thrown down the spiracles or openings, which in the form of towers rise into the open air, and through some of which one may speak from the walls of the city with those who are going along the aqueduct. The roof with respect to duration, appears to be an everlasting work, it being not only of free-stone; but in many places overlaid with a very hard kind of rosin, as with a varnish, so that it looks like one entire solid piece. The descent to this subterraneous canal is by the steps of the tower near the spring of the Sala, whose water overflowing, runs about fifty paces before it discharges itself into the fresh-water stream, and then does not immediately mingle with it.

SECT. III.

Of the principal Places in Lower Bavaria, particularly of Landshut, the imperial City of Ratisbon, &c.

THE principal town in Lower Bavaria is Landshut, which is seated on the Iser, in the forty-eighth degree forty-one minutes north latitude, and in the twelfth degree twenty-five minutes east longitude, forty-six miles to the north of Munich. It is not only well built and strongly fortified; but stands in the richest and most pleasant part of all Bavaria, and is the seat of the elector's lieutenant for Lower Bavaria, who has a court here and several offices. It has a bridge over the Iser, and on the other side a suburb called Saldenthal, in which is an abbey of Cistercian nuns. The town contains an electoral palace seated on a hill, with another which stands in the midst of the town. Its principal church, dedicated to St. Martin, has a tower, which is esteemed the highest in the empire, and hence it obtained the name of Lands-hut, which signifies The hat of the country. The new buildings, added to the duke's palace, consist of a neat piece of architecture in the Italian stile. There is here also a parish-church dedicated to St. Job, a college of Jesuits, three convents of monks, and the same number of nuns.

The imperial city of Ratisbon, called by the Germans Regensburg, is a large fortified and populous town, seated on the Danube, in the forty-ninth degree ten minutes north latitude, and in the twelfth degree east longitude. This city is the capital of the popish bishopric of Ratisbon, yet both the magistracy and burghers are of the Lutheran religion. The river Regen runs through the town, and then falls into the Danube. The city is well fortified with a double wall, ditches, and ramparts,

parts, and stands in a soil abounding in corn, pasture, and vineyards, whose grapes produce a strong and palatable wine. The largest church belonging to the Lutherans is that of the Trinity, and they have also an academy, in which are eight teachers. There are here four immediate states of the empire, which consist of the bishopric, and the imperial foundations of St. Emmeran, with the abbies of Upper and Lower Munster. There are here also a college of Jesuits, a cloister of St. James, instituted by Scotsmen of the popish religion; the collegiate church of Altkapell, the nunneries of St. Clara and St. Paul, and the hospital of the Holy Cross. Here the imperial diet often meet in a large upper room hung with tapestry, in which is the emperor's throne of cloth of gold. The elector Palatine has also two fine palaces in the city, and there are several others belonging to the neighbouring prelates. Among the other public buildings is a stone bridge of fifteen arches over the Danube, the most substantial structure of the kind either on this river, or on the Rhine: it is twenty-three feet broad, and about one thousand and ninety-one in length. It is supported by square piers, and defended by buttresses against the force of the stream and shoals of ice.

The bishop of Ratibon is a prince of the empire, and sits on the bench of ecclesiastical princes between the bishops of Freysing and Passau, and on that of the circle of Bavaria, between the same prelates. The limits of this bishopric comprehend two collegiate churches, twenty-eight abbies and prelacies, and twenty-nine rural deaneries, to which belong one thousand three hundred and eighty-three parishes, chapels of ease, and chaplainries. This bishop, who is a sovereign prince, has his consistory, his council, and treasury; but the elector of Bavaria holds the bishop's court in the city of Ratibon.

The abbey of St. Emmeran, which consists of Benedictine monks, is under the government of an abbot, who has his seat at the diet of the empire on the Rhenish bench of prelates, and has also a seat and voice in the diet of Bavaria. The church of this cloister boasts of keeping the compleat body of St. Denis the Areopagite, which they say was stolen out of the abbey of St. Denis in France, though the latter maintain that they are still in the possession of it; yet in the palace chapel of Munich is one of his hands, and both in the cathedral church at Bamberg, and in that of St. Vitus, in the cathedral at Prague, the head of this saint is shewn.

The two princely abbies of Upper and Lower Munster are under the government of two abbesses, who have the title of princesses, and have likewise a vote at the diets of the empire, and the circle of Bavaria; but the ladies of these foundations may marry out of them.

Within the circle of Bavaria is also the city of Freysing, the capital and residence of the bishop, who is a sovereign prince. It stands on two hills on the little river Mosach, not far from the Iser, and commands a most delightful prospect into the electorate of Bavaria, the archbishopric of Saltzburg and Tirol. One of these hills is within the city walls, and upon it stands the bishop's palace, with a cathedral, a Benedictine church, and the collegiate churches of St. John and St. Andrew, St. Peter's chapel, and other public edifices. In the other part of the city is a large market-place, in the center of which stands a beautiful marble statue of the virgin Mary, with the church of St. George, a seminary of Benedictines, a Franciscan convent, an orphan-house, and an hospital. Without the city are the bishop's gardens, and a convent of Præmonstratenses. On the other hill, which lies to the west of the city, is a Benedictine abbey, and below it the collegiate church of St. Vitus.

S E C T. IV.

Of the Upper Palatinate, or Palatinate of Bavaria, the Dutchies of Neuburg and Saltzbach, and the Bishopric of Passau, with the principal Places in each.

THE Upper Palatinate, which lies on the Danube, belongs to the duke of Bavaria, and is sometimes called the Nordgaw, from its lying to the north of the

elector's other dominions. It is bounded on the north by Voigtland in Upper Saxony; on the east by Bohemia and Austria; on the south by the Danube, which separates it from the dutchy of Bavaria, and by Swabia and part of Franconia on the west.

It is a mountainous, rocky country, but rich in mines of silver, copper, and iron; some of its valleys, however, produce corn and good pasture; and they have likewise some vineyards. But this dutchy does not entitle the elector to a particular seat, either in the college of princes, or the circle of Bavaria.

The capital of the Upper or Bavarian Palatinate is Amberg, which is situated on the little river Ilz, or Ils, which runs through it; and is so well fortified, that it is reckoned one of the strongest towns in Upper Germany. Its principal ornaments are the castle and armoury, both which are handsome structures, as are also the electoral palace, the cathedral dedicated to St. Martin, and the college of Jesuits, which has a beautiful church. This city, which is seated in the forty-ninth degree twenty-six minutes north latitude, and in the twelfth degree four minutes east longitude, is conveniently situated for traffic, it being almost in the centre between Ratibon, Ingolstadt, and Nuremberg. Its greatest trade arises from its iron-mines and manufactures, which are sent down the Nabe to Ratibon and other cities.

In the year 1703, the Imperialists took this city from the elector, who was put under the ban of the empire, for joining with France in the war then carrying on against the emperor Leopold and his confederates. In the war of 1743, between the late elector, the emperor Charles VII. and the queen of Hungary, Amberg, with all the Upper Palatinate, was taken by the Austrians in the service of that princess.

The principalities or dutchies of Neuburg and Sultzbach form the northern part of the Upper Palatinate, and are reckoned in Bavaria, though they are subject to the elector Palatine, who on account of Neuburg has a seat and voice both in the diet of the empire, and the circle of Bavaria.

Neuburg enjoys a government of its own, together with a chamber of justice, and a prefecture-office. It has still some Lutheran fiefs; but the prevailing religion is the popish. The bailiwicks belonging to it lie dispersed. The most remarkable places it contains are the following:

Neuburg, or Newburg, the capital of the whole dutchy, and the seat of the government, stands on a hill, in a good situation by the Danube. It is well built and fortified, and has a palace, with a college of Jesuits, which was formerly a convent of ladies, and other public buildings.

Hochstet, or Hochstadt, is a small town seated on the Danube; but is well provided with all sorts of necessaries, and has rich corn-fields and good pastures in its neighbourhood. In 1634, during the civil wars in Germany, the Croats barbarously cut off many of the inhabitants, and ruined most of the town; but it has been since pretty well rebuilt, and defended by a strong castle on the Danube, over which is a wooden bridge, a little below the town. This place is most famous for the glorious victory gained near it on the second of August 1704, by the united forces of the Imperialists, English, and Dutch, under the command of the duke of Marlborough and prince Eugene, over one of the compleatest armies of French and Bavarians that ever took the field, commanded by the elector of Bavaria, and the French marshals Tallard and Marsin, who were entirely defeated, about twenty thousand being killed on the spot, or drowned in the Danube, and about thirteen thousand taken prisoners; among whom was marshal Tallard, who with many officers of rank were brought to England, and remained at Nottingham, where they were allowed their parole, till the year 1712. In remembrance of this victory a pillar was erected with a Latin inscription; and in acknowledgement of the signal services here performed by the duke of Marlborough, the emperor Leopold created him a prince of the empire, under the title of Mindelheim, a place in Bavaria, which in the year 1714, was restored to the elector by the treaty of Baden.

Blenheim,

Blenheim, a village seated on the Danube, not far from Hochstet, and which also gives name to the above battle.

The principality of Sultzbach has also a particular government of its own, together with a tribunal. The inhabitants and churches are partly Lutheran and partly of the Romish religion, and the affairs of the Lutheran consistory are managed by the government, in which two Protestant counsellors preside.

The principal town in this district is Sultzbach, the capital of the principality, and the residence of the regency and tribunal, though the number of the inhabitants does not much exceed three hundred. It is, however, divided into two parts, and the upper, which stands on a hill, is separated from the lower by a wall. The prince's palace stands on a rock opposite the upper town. The Lutherans have a church and a grammar school, and the Roman catholics a Latin school and a Capuchin convent.

The bishopric or principality of Passau lies between Bavaria, Bohemia, and Austria, and is seated on the river Danube. The bishops were formerly suffragans to the archbishops of Salzburg; but are now made independent, and the bishop of Passau in the college of imperial princes sits on the ecclesiastical bench between the bishops of Ratisbon and Trent; but in the circle of Bavaria is the last among the prelates. To the episcopal cathedral, so far as its jurisdiction extends over Bavaria, belong two collegiate churches, with thirteen abbeys and priories, and ten rural deaneries, containing three hundred and twenty-eight places of worship; it also extends a great way into Austria. The revenues of this bishopric are said to amount to eighty thousand crowns a year.

Passau, the capital of this bishopric, is seated on the Danube, which at this place receives into it the Inn, and on the other side the Ilz, a river famous for its beautiful pearls. It consists of three towns, that properly called Passau, lying between the rivers Danube and Inn; the Instadt, which stands on the other side of the Inn, and is joined to the former by means of a bridge; and the Ilzstadt, which is on the north side of the Danube, where it receives the Ilz. The last of these rivers runs between Ilzstadt and the mountain of St. George, on which stands a castle. The city on those sides that are surrounded by the water is without walls; but towards the land side is fortified both with ramparts and ditches. The cathedral, which is dedicated to St. Stephen, was, together with the city, burnt down in the year 1662, but has been rebuilt with great splendor, and on an eminence near it stands the bishop's palace. Besides several parish-churches there is in this city a convent of Benedictines, a Franciscan and a Capuchin convent, with a college of Jesuits. On the hill, at the foot of which Instadt is seated, is the Pilgrim church, called Mariahulf, and near the town of Passau, properly so called, is the convent of St. Nicholas, in which are regular canons of the order of St. Augustine: Passau enjoys a very good situation for trade.

S E C T. V.

The Archbishopric of SALTZBURG.

Its Situation, Extent, Produce, and Rivers. The Religion and Government of the Inhabitants; with the Power, Titles, Arms, Revenues, and Forces of the Archbishop.

THE archbishopric of Salzburg, which is in the southern part of Bavaria, is bounded on the east by Austria and Stiria, on the south by Carinthia and Tyrol, on the west by Upper Bavaria, and northward by the same part of that electorate. Its length and breadth are very differently represented by different authors; but by the lowest computation it is a hundred and fourteen miles in length and breadth.

This country is on all sides defended by mountains and narrow passes, or rather entirely consists of mountains and valleys. No kind of grain is sowed here, whence it is supplied with all its corn from Bavaria; but every part of it produces excellent hay, and a great number of fine cattle. The horses in particular are

esteemed for their beauty, hardiness, and vigour, being able to travel full speed up the highest mountains with no other food than hay and grass, without any oats.

At Hallein, which is about two hours distance from the city of Salzburg, are salt-works belonging to the sovereign, in which salt of all colours, as yellow, red, blue, and white, is hewn out from along the subterraneous caverns, and then dissolved in fresh water; which being conveyed into pits, the finest salt is made of the brine: but these works are only carried on in summer, when a sufficient quantity is made not only for home-consumption, but to answer all the demands from Bavaria, where it is exchanged for corn. In this archbishopric are also considerable mines of silver, copper, lead, iron, and lapis calaminaris. A great deal of steel and brass is also made here, and the plenty of these metals remarkably appears in the astonishing number of swords, sabres, bayonets, muskets, cannon, and mortars, to be seen in the armouries all over the country. In this bishopric is also found a very good marble.

The principal river in this country is the Salza, or Salzach, which rises in the valley of Crumbler, towards the county of Tirol, watering a great part of it; and, after receiving into it the little rivers of Saal and Gastein, which rise in this country, continues its course into Upper Bavaria, where it falls into the Inn, which washes a small part of the western side of the archbishopric. Here also rise the Ens and Muer, with many other little streams, rivulets, and lakes; all which abound in fish.

Though the popish doctrines and worship are alone tolerated in this archbishopric; yet, at the time of the Reformation, Lutheranism was embraced by great numbers, whom archbishop Matthew Langins harrassed and strove to extirpate by oppression and violence. But archbishop John James proceeded with greater mildness, and, in order to reconcile all tempers, obtained the pope's licence to administer the sacrament in both kinds. Archbishop Wolfgang Theodoric, in the year 1588, drove great numbers of his Lutheran subjects out of the country, and his successor, Marcus Sittich, count of Hohenimbs, neglected neither fair means, menaces, nor violence, particularly by quartering troops on the Protestants, to bring them again to the church of Rome, in so much that it was supposed the whole country was become Roman. But succeeding times shewed that this was a mistake, great numbers openly professing Lutheranism. On this archbishop Maximilian Gandolph left them no other alternative than either to fly their country, or abjure their faith. But the most violent flame of persecution blazed out under archbishop Leopold Anthony Eleutherius, baron of Firmian, whose cruel zeal for suppressing Lutheranism in his province was so great, that the oppressed party were obliged to apply for redress to the states of that religion in the diet, who prevailed so far, that, in the year 1732, permission was granted to the Lutheran Saltzburghers to withdraw quietly with their effects; on which above thirty thousand persons embraced this opportunity, dispersing themselves into the other protestant countries of Germany, Prussia, and even the English colonies in America: in all which places they were received with all that benevolence and encouragement which their magnanimity deserved; and these emigrations have continued ever since.

In the archbishopric are six cities and twenty-five market-towns. The estates of the nobility enjoy a jurisdiction over the vassals. All peasants are, however, allowed the use of fire-arms; and, being from their early years trained up at shooting at a mark, would on occasion prove a very serviceable body. The nobility were here formerly very numerous; but the policy of the princes set so many springs at work to oppress and extirpate them, that not even one at present remains, and all their estates are in the hands of the church. With respect to the few nobles at court, or belonging to the cathedral, they are all foreigners, especially Austrians, Bohemians, and some Bavarians. The nobility being therefore extinct, the prelates and commons form the states of the country: the former of these are the bishop of Chiemsee, the prior of the cathedral, the abbot of St. Peter at Salzburg, the prince of Berchtolsgader, the abbot

abbot of St. Michael in Bavaria, the prior of Haglwerth, and the abbess of Nunnberg; the latter are composed of the cities and twenty-two market towns.

The titles of the archbishop are, By the grace of God prince of the holy Roman empire, and archbishop of Saltzburg, Legatus Natus of the apostolic chair of Rome, and primate of Germany.

His arms are in the dexter half or, party per pale a lion sable; but the sinister is damasquined. His supporters are a sword and a crozier surmounted, as it were, behind with a cross.

Besides his being the born and perpetual legate of the apostolic see, and primate of Germany, he also enjoys several other important honours. He wears a cardinal's habit, and all appeals from him lie to the pope alone in person, by whose permission he disposes of canonships. The emperor styles him well-beloved; but all other ecclesiastics who are not of princely blood, have only the title of honourable, and your reverence. This archbishop has the following suffragan bishops under him; those of Freysing, Ratibon, Brixen, Gurk, Chiemsee, Seckau, and Lavant. The four last are even nominated, consecrated, and confirmed by his own power, without standing in need of the pope's confirmation; and, indeed, he is the only archbishop who enjoys this privilege. His temporal pre-eminences are, that except the electoral archbishops, he is the only archbishop in all Germany who sits and votes in the diet of the empire; and in the college of princes, he enjoys alternately with Austria, the first seat on the ecclesiastical bench, and likewise in the directory.

The principal colleges of the archbishop are the privy, or state council, the consistory, the court of justice, the treasury, and the council of war.

His revenues, according to Keyser, amount to eight hundred thousand rixdollars a year. The military force of this archbishopric consists of only one regiment of foot, containing a thousand men, whose uniform is generally white faced with red. His fifty halberdeers and fifty horse-guards are rather instituted for the splendor of the court than for the military establishment; these, who are the life-guards, and the other officers, wear black with red facings and gold lace. A great number of soldiers, in a country so well defended from invasions, by its mountains and narrow passes, would be needless and inconvenient, on account of the scarcity of corn, and the bravery and expertness of the peasants. Every bailiwick has its rendezvous, to which on a signal being given, by means of cannon planted on the mountains and towers, they repair completely armed, and there wait the command for marching. There are said to be twenty-five thousand peasants, who never fail to hit a mark of a hand's breadth.

S E C T. VI.

Of the City of Saltzburg, and the several Palaces belonging to the Archbishop in that City and its Neighbourhood.

THE principal place in this archbishopric is the city of Saltzburg, in Latin Salisburgum, the capital of the archbishopric, and the residence of the archbishop, which is situated in the forty-seventh degree forty-five minutes north latitude, and in the thirteenth degree five minutes east longitude, seventy-one miles to the south-east of Munich. It is surrounded by three mountains called Imberg, Schlossberg, and Munchberg; but on one side is open to a large plain, through the midst of which runs the Salza. It is computed to be five thousand geometrical paces in circuit, and is well fortified: that part of the city which lies to the right of the river, is surrounded with eight bastions; that on the left side with three: the mountain-castle which stands in the former is very strong, both from its situation and its works, and in it is the principal arsenal. It is provided for a whole year with necessary provisions, and the garrison is never changed.

Saltzburg is a fine city, and the greatest part of the houses are five stories high; but the streets are narrow, and being paved after the old fashion, the course of the

water and filth is in the middle, and the spouts consequently project to some distance from the houses. The roofs from the streets appear entirely flat; but only consist of several small low ridges that are hid by the four main walls of the houses. One part of the city stands on a steep rock. Before the palace fronting the new apartments is a fountain, esteemed the largest and finest in all Germany; the figures are all of white marble; but in the grotesque taste. The reservoir is one hundred and seven feet in circumference, exclusive of the steps; four large horses spout the water out of their mouths and nostrils, though not in such quantities as the statues above them. The height of the whole work exceeds fifty feet, and is surmounted by a column of water eighteen feet high.

The palace, which is a magnificent structure, contains one hundred and seventy-three rooms. The archbishop's apartment is very noble, the ascent to it is by a large marble stair-case, and the ceilings are finely painted and gilt. The furniture is surprisingly rich. Another apartment still more magnificent, if possible, is used on days of ceremony. Indeed, the whole palace abounds with fine pictures, tables of inlaid marble, and superb stoves of all colours, ornamented with statues. But though the tapestries are valuable on account of the gold and silver they contain, yet age has deprived them of the greatest part of their beauty. From the roof of the palace, which you may go quite round upon boards laid over the small ridges, is a delightful prospect. The new apartments, though not in the exact rules of symmetry, are a considerable ornament to the place, and contain all the offices of the archbishop. The stables are in three long and arched divisions; the horses, which amount to one hundred and fifty, eat out of white marble mangers; and twice a week a running water being turned in through both sides of the stalls, carries away any filth that may have gathered there. Over this stable is the fencing school, and before it a pond for watering the horses ninety-three feet in length, in the midst of which stands a very large horse made of one piece of marble, with water gushing out of its mouth.

The winter riding school is very lofty, with seats placed between the windows on both sides of the walls, for the accommodation of spectators of distinction, that the riders may not be incommoded in their exercise. The summer riding school, which also serves for baiting wild beasts, is in the open air, and has three galleries, one side of which are all cut out of the rock.

The cathedral of St. Rupert is built of free-stone, and has a stately front, adorned with four marble statues of St. Peter, St. Paul, St. Rupert, and St. Virgilius; the two latter being formerly its bishops, and the inside of the building is adorned with pilasters of the Corinthian order. It is built in the form of a cross. Its high altar is of marble, which on grand festivals bears a sun of gold, adorned with precious stones to the value of one hundred thousand crowns, with a large cross of gold, and four candlesticks of the same metal. All the other altars are of beautiful marble of different kinds, and under the cupola are four of them, with an organ over each; but the fifth and finest organ, which is over the chief entrance, consists of three thousand two hundred and sixty-six pipes, the longest of which is thirty-three feet. To this organ belong four keys, and forty-two registers, of which seventeen are of clock-work. The roof of this church is covered with copper, and the gallery between the cathedral and palace is of white marble.

The new university church of the immaculate conception of the Blessed Virgin is a noble building, and the inside ornamented with very fine stucco-work. Before the Theatine convent stands a marble pillar of one single stone twenty-four feet high.

A covered bridge leads from the lower part of the city to the archbishop's palace of Mirabella, whose fine chapel constitutes the middle part of the principal front: facing it is a mount Parnassus, with a Pegasus on the top, from which the water falls in cascades. In the palace is a grand marble stair-case finely painted, and the great hall is adorned with curious tables, and many beautiful landscapes. The floors, as in the city-palace, are inlaid with

red and white marble, and the hangings are mostly red embroidered with gold and silver. The garden is very beautiful, and the Salza, which runs close by it, adds to the agreeableness of the prospect. Within the garden is a large aviary, where, during the summer heats, the archbishop frequently takes a repast. The theatre decorated with green turf is very beautiful, and has four large marble groupes, the rape of Proserpine, the rape of Helen, Hercules wrestling with Antheus, and Æneas carrying his father out of Troy.

About a quarter of a league from Saltzburg is Hellbrun, another of the archbishop's seats. The building contains nothing remarkable; but the garden is extremely pleasant, it being laid out in the manner of a wilderness, and abounding with the finest water-works, reservoirs, ponds, and basons, all so clear that you see the trouts and other fish sporting in them. Among other

beautiful grottos is one with an old decayed brick roof of curious workmanship. Over one of the many springs in this garden is the statue of a monster, which may be taken for a wild man, had it not a cock's comb, and the feet of an eagle. Under it is the following inscription:

"The original of this monstrous figure, called a forest devil, was caught in hunting near Havensburg, Matthew Lang being then cardinal and archbishop. His skin was yellowish, he had all the marks of a savage disposition, yet never looked at any one, but hid himself in corners. He had the face of a man with a beard, eagle's feet with lion's claws, the tail of a dog, and on his head grew a large comb like that of a cock. He soon died with hunger, as neither allurements nor violence could bring him to eat or drink."

CHAP. XV.

Of the Circle of FRANCONIA.

SECT. I.

Of Franconia in general, and first of the Bishopric of Bamberg; its Situation, Extent, Produce, and principal Rivers. The State, Privileges, and Arms of the Bishop; the Offices of the Government: with a particular Description of the City of Bamberg, and the Palace of Pommersfeldt.

FRANCONIA, called by the Germans Frankenland, is bounded on the north by Thuringia, Saxony, and Hesse; on the east by the palatinate of Bavaria, and part of Bohemia; on the south by Swabia; and on the west by the circle of the Rhine, part of Hesse, and the Wetteraw; extending from east to west about a hundred and thirty miles, and from north to south a hundred and thirty-five; but is in both ways much indented.

The states of this circle are divided into four benches: to the spiritual bench of princes belong the bishoprics of Bamberg, Wurtzburg, and Eichstadt, with the Teutonic order; to the secular bench of princes, Brandenburg-Baireith, Brandenburg-Anspach, Henneberg-Schleusingen, Henneberg-Rombild, Henneberg-Schmal-kalden, Schwartzenberg, Lowenstein-Wertheim, and Hohenlohe-Waldenburg; to the bench of counts and lords, Hohenlohe-Neuenstein, Castell, Wertheim, Rieneck, Erbach, Limburg-Geildorf, Limburg-Specksfeld, Seinsheim, Reigelsberg, Wiesentheid, Welzheim, and Hausen; and to the bench of imperial cities, Nuremberg, Rothenburg, Windsheim, Schweinfurt, and Weisenburg.

The summoning princes for this circle are the bishop of Bamberg, and the margraves of Brandenburg-Baireith and Anspach, who take their turn in summoning every three years.

With respect to religion, this circle, which is one of the mixed, presents one Roman catholic and one protestant assessor to the chamber-judicatory of the empire. The death of the former is notified by the chamber to the popish, and that of the latter to the protestant summoning-office of the circle.

The first country we shall describe in this circle is the bishopric of Bamberg, which terminates to the north on the principality of Coburg and the Voightland; to the east on Brandenburg-Baireith and the territory of Nuremberg; to the south on the territory of Nuremberg, Brandenburg, and the principality of Schwartzenberg; and to the west on the bishopric of Wurtzburg. Its greatest extent is about seventy-one miles in length, and its greatest breadth above forty-eight miles.

The soil of this bishopric produces all sorts of grain, vegetables, and fruit, in abundance; particularly grapes, of which good wine is made. It likewise yields saffron, and an excellent sort of liquorice, of which great quan-

ties are exported; and near the city of Bamberg are such numbers of laurel, fig, orange, and lemon-trees, that this spot has been stiled the Little Italy of Germany. It has also good woods, and a great number of cattle.

The Maine, which issues out of this country, traverses the north part of it, and receives the Rotach, the Itz, or Its, and the Rednitz; the latter of which also rises here, after which the Maine receives several smaller streams.

Bamberg contains eighteen boroughs and fifteen market-towns, and the inhabitants are zealous papists.

The bishop of Bamberg stands immediately under the papal see, and may act within his own diocese as an archbishop. King Henry, the founder of this bishopric, appointed the king of Bohemia upper cup-bearer, the elector palatine upper sewer, the elector of Saxony upper martial, and the elector of Brandenburg upper chamberlain of the bishopric. These electors invest four antient families of the nobility of Franconia with these offices, which they perform as their deputies.

The arms of this bishopric are a lion fable, in a field or, over which is a band argent traversing the whole.

The bishop has his seat and voice at the diet of the empire, and has the fourth place on the spiritual bench.

The episcopal vicar resides among the clergy and determines their disputes, and all appeals lie to him from the consistory, which decides in matrimonial cases; but from the vicariate appeals lie to Rome. The regency consists of a president, a chancellor, and about twenty aulic counsellors. Under the regency are the inferior courts of St. Stephen, St. Gangolph, and St. James; with the provincial-court at Bamberg, the pupil-court, and police-court, the penal or criminal-court, and the office of under-bailiff.

The aulic chamber and upper receipt-office have the care of the bishop's revenues. Each of these offices has a president, and the latter also represents the aulic military council, who have the management of military affairs.

The principal place in this bishopric is Bamberg, antiently called Babenberg, which is seated upon hills near the river Rednitz in a fertile and delightful country, in the 50th degree 15 minutes north latitude, and the 10th degree 15 minutes east longitude. The town itself, which is in most parts surrounded with a wall and ditch, is not large, but has extensive suburbs, and is, in general, well built and populous. In the upper part, which stands upon a hill, is the princely residence of Petersburg; and also the great cathedral church of St. George, a vast Gothic edifice, with a lofty steeple and four noble spires. In this church is the monument of Henry II. the founder of the bishopric, and his consort Cunigunda. The marble

ble image of the empress lies on the right side of her husband, and the tomb is adorned with basso relievos representing the most remarkable passages of Henry II's life, among which the circumstance alledged in the bull for Cunigunda's canonization is not omitted, namely, that the emperor, on his death-bed, solemnly declared before several princes and other witnesses, that he left Cunigunda a virgin, as he received her. In the treasury belonging to this cathedral are a great number of jewels and relics; but what is most curious are the four Gospels written on parchment in beautiful letters of gold, finely bound, and set with precious stones. There is here the bull of pope Boniface VIII. in which the credulous vulgar are assured, that the holy nail kept here is unquestionably one of those that fastened our Saviour to the cross. Among the other public buildings are the cathedral of St. Stephen and St. James, with a Benedictine convent on the Monchsberg, which is a magnificent edifice, and the church belonging to it has an admirable frontispiece, a superb arched roof, and three fine organs: it is also embellished with sculpture and paintings; among the latter, the altar-piece, which is adorned with the representation of the assumption of the Virgin Mary, is most remarkable. Here is also the nunnery of St. Theodore. In the middle part of the town, which has a communication with the upper part, by means of a lofty stone-bridge, are many fine houses; as also the antient palace of Geyerwerth, which has a noble orangery; a fine church of the Jesuits, who have the inspection of the university; the parish-church of St. Martin, that of St. Mary, three monasteries, two nunneries, and an hospital. A long and broad bridge leads from the middle part of the town to the suburbs of Treuerstadt, in which is the Dominican nunnery of the holy sepulchre.

About three hours journey from Bamberg is the castle or palace of Pomersfeldt, which belongs to the bishop, and stands in a delightful country. This is a magnificent structure; but, instead of a grand entrance, or portico, it has three small doors, and two more in the wings. Opposite the front of the palace are the menagery and stables, which are built in an oval form, with a colonade. On one side of the middle door stands the statue of Julius Cæsar, and on the other that of Alexander the Great, with the Gordian knot at his feet. At the entrance of the bishop's apartments, which are in the front, are on one side the statues of Faith and Charity, and on the other Justice and Fortitude. The grand double stair-case has few equals; it is indeed but one story high; but the roof is as high as the palace itself, and the ceiling is finely painted by Bies, one of the gentlemen of the bed-chamber, and Marchini, an Italian. The stairs, with the sculpture on each side, are of free-stone.

From the court at the foot of the stair-case you descend down some steps into a beautiful grotto, covered with stucco-work, so finely polished that it resembles marble. In this grotto are eight statues, representing the seasons and the four elements; and between these are several elegant figures of shell-work, representing sea-animals. The lustres are of glass of various colours; and on each side of the grotto is a small colonade, where in summer orange-trees, &c. are set, which, by their verdure and fragrance, add to the agreeableness of this cool retreat.

In the story where the grand stair-case ends, and exactly over the grotto, is a hall well worth seeing. It is adorned with capital pictures and family portraits, the ceiling is curiously painted and adorned with gilt cornices, and it yields a charming view of the gardens, and a delightful prospect of the adjacent country.

Most of the other apartments are small; but the tapestry hangings and other furniture are very splendid. One room exhibits ten battles in which prince Eugene signalized himself by his conduct and courage; and in the bishop's drawing-room is a copy of Corregio's night-piece, in which is represented the birth of Christ. Over the fire-place in the bed-chamber is a very fine picture of an old man praying to a crucifix, and in the same room is the birth of Christ in Mosaic work. Adjoining to this room is a looking-glass closet, in which is a great quantity of valuable China ware, and some of the finest Dresden porcelain. On the tables are placed crystal vases, cups made of precious stones, and other curiosities; a-

mong which is an exquisite piece of workmanship in amber, representing our Saviour in his agony in the garden, supported by an angel. The dining-parlour is hung with gilt leather, on which is represented David's triumphant entry, after he had killed Goliath. In this piece, which is very old, the figures are as big as the life, and well executed. The chapel is not answerable to the magnificence that appears in every other part of this palace. Before the altar are deposited the bowels of the late elector of Mentz, whose heart lies buried at Bamberg, and his body at the city of Mentz. On the top of the palace stands an image of Atlas, with an armillary sphere on his shoulders.

The garden is on a slope or gentle declivity, and on each side is a small wood of linden-trees planted in vistas.

S E C T. II.

Of the Bishopric of WURTZBURG.

Its Situation, Extent, and Produce; the Religion of the Inhabitants; the Titles, Arms, and Officers under the Bishop; with a particular Description of the City of Wurtzburg.

THE bishopric of Wurtzburg is bounded on the east by the bishopric of Bamberg, the principalities of Schwartzenberg, Brandenburg, Onalzbach, and the signiory of Rothenburg; on the south by the county of Hohenlohe; on the west by the archbishopric of Mentz, and the abbey of Fuld; and on the north by the county of Henneberg, and the principality of Coburg; extending about sixty-five miles in length, and fifty in breadth.

The soil is very fruitful, and produces more corn and wine than the inhabitants consume. The principal river in this country is the Main.

The established religion is that of popery, but there are also Lutheran and Calvinist churches within the territory of Wurtzburg; but these frequently make the most grievous complaints of oppression and injustice to the diets of the empire, from which they seek redress.

The title of the bishop is, Of the holy Roman empire, prince, bishop of Wurtzburg, and duke of East Frank-
enland.

His arms on account of the bishopric are, an ensign gules and argent, obliquely waving, quartered, and supported on a lance or, in a field verte; and on account of the duchy of Frankenland, a cross striped quarterly gules and argent, with three points terminating gules. Behind the shield armorial project a crozier and a sword.

The bishops of Wurtzburg cause a naked sword to be carried before them, and in 1752 pope Benedict XIV. granted them the privilege of bearing the archiepiscopal pall and cross; but in other respects they are suffragans to the archbishop of Mentz. At the diet of the empire this bishop is possessed of the fifth place on the spiritual bench in the council of the princes; but in that of Franconia he has the first voice.

The episcopal high colleges are the following: The spiritual regency, which has the management of such affairs as relate to the episcopal jurisdiction; the vicariate, which determines all disputes relating to religion; and the consistory, which has the management of matrimonial affairs. From these two last an appeal lies to the metropolitan.

The temporal colleges are the privy council: the regency and Aulic council, which judge in all criminal and civil affairs: the Aulic tribunal, to which an appeal lies from the provincial: the provincial tribunal, which judges matters of inheritance, guardianship, and the like: the upper council, to which belong matters of police, and the town council.

The episcopal revenues are estimated at four or five hundred thousand guldens. This prince and bishop maintains five regiments of foot and horse, and all military affairs are subject to the Aulic council of war.

In this principality are thirty-three boroughs, and about ten market towns, the principal of which is the following.

Wurtzburg, in Latin Wirceburgum, was antiently called Herbipolis, and is seated on the river Main, in the

the forty-ninth degree thirty-nine minutes north latitude, and in the ninth degree forty-eight minutes east longitude. It is the capital of the bishopric, and is well fortified and defended by a castle that stands on a high and rocky mountain, and in which is an episcopal palace, and a well provided magazine. The above citadel is called Marienberg. The first gate is defended by two bastions paved with hewn stone, and a deep broad moat. Over it are the arms of Philip of Schonborn, elector of Mentz and bishop of Wurtzburg, who built it in 1652. It is adorned with eight statues of stone, three without, in Roman armour, and five within, one in the middle representing Hercules leaning on his club. The fortifications are all lined with hewn stone; but are irregular on account of the situation. The apartments in this castle are very commodious, and well furnished, and the tapestry, in particular, is very magnificent. The chapel is built in a fine taste, and has a handsome dome, with four beautiful altars covered with stucco; two in imitation of porphyry, and two that resemble jasper. In the cellar belonging to this castle is an avenue, bordered on each side with fifty lofty tons, holding each about fifty hogheads of wine, French measure. This avenue is so extensive, that you can hardly see the end of it, though it is well lighted; for each ton has a great iron candlestick that holds a flambeau of yellow wax. These enormous tons are neatly adorned with grapes, glasses, and goblets in basso relievo.

The town is divided into four quarters and four suburbs, which lie on both sides the Maine, over which is a stone bridge of eight arches, at the entrance upon which is a triumphal arch of hewn stone, adorned with two statues of Pallas in niches on the outside, and two of Mars in niches within. The city has a very gay aspect: its public squares and streets are very neat and agreeable; the houses very commodious, the situation and air pleasant and wholesome, and enjoying every thing in plenty that human life requires.

Among the other public buildings the most remarkable are the new palace, the churches and convents; the former, in which the bishop resides, is a very noble building, the first stone of which was laid by bishop John Philip Francis, count of Schonborn, in 1720.

The cathedral, dedicated to St. Kilian, is an antient Gothic structure, with no other ornament on the outside but four lofty spires, two to each front. The roof is supported by twenty pillars, which form two porticos, the ceilings of which are ornamented with stucco divided into compartments. At each pillar is a sculptured altar adorned with pictures, gilt columns, and statues; each altar dedicated to some saint. The pulpit is of white marble, embellished with the history of our Lord's sufferings in basso relievo gilt, and the pedestal which supports it, is adorned with eight statues of the four evangelists, and the four doctors of the church, inclosed within an iron balustrade very neatly wrought. At the two corners of the choir are two magnificent altars, with pillars of black marble, and much gilding: one is dedicated to St. Joseph, spouse to the virgin Mary, and to St. John Nepomuc; the other to St. Philip and St. Cunibert. The statues of these saints, with those of two angels, are all richly gilt. The pictures on one of these altars represents an Ecce Homo, and the other old Simeon holding the infant Jesus in his arms. The principal altar in the middle is a magnificent dome, richly adorned with sculpture and gilding, and supported by four large columns of black marble with white veins, the bases, capitals, cornice and festoons richly gilt. Between these columns are five grand busts gilt; one of the virgin Mary, another of St. Andrew, and the three others St. Kilian, St. Colonat, and St. Totnam, who are here called the apostles of Franconia. Among the treasures in the sacristy are shewn, a large cross of gold, enriched with a multitude of diamonds; another cross of massy gold adorned with large sapphires, rubies, and emeralds; a large chalice of solid gold, set with diamonds; five busts of solid silver, representing the virgin Mary, St. Andrew, and the three apostles of Franconia; and it is pretended that the heads of the three last are inclosed within their busts.

To this cathedral belongs a chapter, consisting of fifty-four canons, twenty-four of whom are called capitulars, and the other thirty domiciliars; but the income is equal, each having three thousand crowns a year; but no person is admitted who cannot give proof to his nobility for four generations, both on his father's and mother's side.

The collegiate church dedicated to St. John the Baptist is pretty, but small. It is built of hewn-stone, and has a handsome front, with a high and well enlightened dome, under which are the statues of our Saviour, the Virgin Mary, and the four Evangelists. Every part of this church is covered with carved work and gilding, as the pulpit, the organs, thirteen altars, including the principal one, of which the large fluted columns and palisadoes are gilt from top to bottom, as well as the statues of the twelve apostles as big as the life, which are placed between these columns. The painting of the altar-piece represents the assumption of the Virgin; and, in short, the benches of the canons are also gilt, it having as many canons as St. Kilian's.

Here are also the parish-church, and foundation of St. Burchard, instituted for noblemen; the parish-church of St. Peter and St. Gertrude; the foundation of St. Anne; an abbey of Benedictine monks of the order of St. Stephen, and another of the order of St. James; a college of Jesuits; a house and church of the Teutonic order; with a house and church of the order of St. John; a seminary dedicated to St. Kilian; and several other religious structures. The great hospital of St. Julian, which is a vast edifice of hewn-stone, is said to be built with greater magnificence than even the palace itself, and the gardens adorned with fountains and statues; with the Aulic, the Theodorian, and the Burgher hospitals.

SECT. III.

Of the Principality of CULMBACH, or BRANDENBURG-BAREITH.

Its Situation, Produce, and Rivers: the Religion and Manufactures of the Inhabitants; the Titles and Arms of the Margrave, with the Orders of Knighthood; the Offices of the Government, and the Revenues and Forces of that Prince.

THE principality of Culmbach projects eastward from the circle of Franconia, to which it is in a manner only joined on the west. It is bounded on the north by Upper Saxony, on the east by Bohemia, and on the south by Bavaria, and a very small part of the territory of Nuremberg; and on the west, by Bamberg.

Part of this country is very mountainous, and the rest, which is sandy, with good cultivation produces various sorts of herbs and fruits; and in general this country affords every thing necessary for the support of man, wine alone excepted.

With respect to its minerals, the principal of these are copper, lead, and iron; for its antient gold and silver mines are gone to decay. It has plenty of marble of all colours, together with crystals.

The principal of its mountains is the Fichtelberg, which extends nineteen miles from east to west, and about the same distance from north to south. It receives its name from the great number of pines with which it is covered, fichte signifying a pine, and berg a mountain; but it also produces fir and beech, and in some places oak, elm, and lime trees. From these woods the peasants that live about the mountain derive most of their subsistence by making charcoal, and in winter bringing the timber down in sledges to sell. It is one of the highest mountains in all Germany, and contains many lofty rocks and desarts, and a number of bogs and morasses.

The rivers of this country are the White and Red Maine, both of which rise here, and having united their streams, obtain the single name of Maine, which, under that denomination, enters the bishopric of Bamberg.

The other rivers are the Nabe, the Eger, the Roslaw, the Thuringian Saale or Sala, and the Pegnitz, which all rise in this country.

This

This principality contains six head towns, as they are called, with ten others, and twenty-six market towns.

The Lutheran church, which is the established religion of this country, is under the inspection of a general superintendent, who resides at Bareith; besides whom there are nine other superintendents, besides the inspector of Rednitz. There are also Calvinists and Roman Catholics, who are in some places permitted the exercise of divine worship.

With respect to the manufactures of this country, the principal of these are woollen cloth, stockings, and hats; a brown and white porcelain, into which silver and gold are very ingeniously and durably annealed; and the marble of this country is polished and worked into a variety of forms. Of these articles large quantities are exported.

The princes of this country and that of Anspach are of the family of Brandenburg, and hence the name of Brandenburg has been prefixed to Bareith and Anspach. The electors of Brandenburg, several centuries ago, gave these countries to two of their younger sons; but in length of time the want of issue made them more than once revert to the electoral line. This was the case for the last time in the year 1603, when Christian, the second son of the elector John George, obtained the principality of Bareith, and Joachim Ernest, his third son, that of Anspach; the lines founded by both of whom are still in being. Erdman Augustus, son to the margrave Christian, propagated the Bareith reigning line, which at present subsists in the margrave Frederic Christian. On the other hand, Frederic and Albrecht, the sons of the above margrave Joachim Ernest, obtained successively the regency of Anspach; and in like manner three grandsons of the latter, of whom only the youngest had succession.

The margraves of both lines bear the following titles: Margraves of Brandenburg in Prussia, of Silesia, Magdeburg, Cleves, Juliers, the Berg, Stettin, and Pomerania; of the Cassubian and Wenden, of Mecklenburg and Crossen, dukes; burgraves of Nuremberg; princes of Halberstadt, Minden, Camin, Wenden, Schwerin, Ratzeburg, and Mors; counts of Hohenzollern, the Mark, Ravensberg, and Schwerin; and lords of Ravenstein and the countries of Rostock, Stargard, &c.

Their arms on account of the margravate of Brandenburg, are an eagle gules, together with trefoil-stalks of the same in the wings, all placed in a field argent. For Magdeburg, a shield quartered gules and argent. For Cleves, eight lilies or, ranged in form of a St. Andrew's cross, and bordered in the middle by a shield argent in a field gules. For Juliers they bear a lion sable in a field or. For the Berg, a lion crowned gules and azure, in a field argent. For Stettin, a griffin gules, crowned or, and weaponed, in a field azure. For Pomerania, a griffin gules, weaponed or, in a field argent. For Cassubian, a griffin sable turned to the sinister side, weaponed or, in a field of the same. For Wenden, a griffin transversely striped, gules and vert, in a field argent. For Mecklenburg, a buffalo's head sable, having horns argent, and crowned gules, with a ring argent running through his nose. For Crossen, an eagle sable, with wings, tail, and weapons expanded in a field or, on whose breast is a crescent argent, and over it a small cross of the same. For Jagerndorf, an eagle sable, with a silver hunting-horn on his breast, in a field argent. For the burgraviate of Nuremberg, a lion sable, prepared for combat, with a red tongue exerted, weaponed and crowned in a field or, placed on another shield, which is intersected five times to the dexter point, gules and argent. For Halberstadt, a shield divided, argent and gules. For Minden, two keys argent, placed in form of a St. Andrew's cross, in a field gules. For Camin, an anchor-cross argent, in a field gules. For Wenden in Mecklenburg, a griffin or, in a field azure. For Schwerin, a divided shield, in the upper part of which is a griffin or, in a field azure; but the under part green, with a silver border. For Ratzeburg, a cross waving and argent, in a field gules. For Mors, a fess sable, in a field or. For Hohenzollern, a shield quartered sable and argent. For the Mark, a fess chequered, gules and argent, in a field or. For Ravensberg, three chevrons gules, in a field argent. For

Schwerin, an arm issuing out of a cloud bearing a ring. For Rostock, a buffalo's head placed obliquely to the dexter side and crowned gules, with an exerted red tongue, and silver horns, in a field or: and for Stargard, a shield divided gules and or.

The margrave of Bareith has an order of knighthood termed the order of Sincerity, but commonly called the order of the Red Eagle; the symbol of which is a square white enamelled cross of gold worn pendant at a scarlet watered ribbon, reaching from the neck to the breast. In the star which the knights of this order bear on their breast is seen the Brandenburg red eagle, and round it the words *SINCERE ET CONSTANTER*. The master of this order is always the reigning margrave.

The reigning prince has on account of the principality of Bareith a seat and voice in the council of the princes of the empire, and is also co-summoning prince of the circle of Franconia.

The princely colleges here are the privy-council, in which the margrave himself presides, and under which are the privy-expedition and the privy-chancery; the regency-college, and regency-chancery; the aulic tribunal; the tribunal for noble fiefs; the chamber-college; the feudal-court; the consistory, and the matrimonial-tribunal.

The prince's revenues, according to Keyser, in the year 1730, scarce amounted to five hundred and fifty thousand guldens; but he observes, that they might be improved to a much greater sum.

This margravate always keeps up a guard of horse, a small body of hussars, and two regiments of foot; besides which a militia is maintained.

The principal places in this country are the following:

Bareith, the residence of the margrave, and the capital of the principality, is the seat of the above offices, and of the mint. It is surrounded with three streams, the Red Maine, the Mistelbach, and the Sendelbach; and is seated in the fiftieth degree of latitude. The prince's palace was burnt down in the year 1753; but has been rebuilt in a grand and beautiful taste. The places of worship in this town are a Lutheran church, that of the Spital, a Calvinist church, and a popish chapel. Here is a seminary founded by the margrave Christian Ernest in the year 1664, and also another seminary and an orphan-house.

St. George on the Lake, a town situated by the side of a lake, at the distance of two miles from Bareith. It was founded in the beginning of the present century by the margrave George William, and endowed with several important privileges. St. Sophia's church, which was dedicated in 1715, is called The chapel of the order and knights, that margrave allotting it for the meeting-place of the order of Sincerity, which he had instituted. The palace of the margrave is a noble edifice, and has a very fine pleasure-garden belonging to it. In this town is also an orphan-house, and a manufacture of white and brown porcelain; in the latter of which gold and silver are very durably annealed. Mr. Keyser observes, that a set, consisting of half a dozen cups and saucers, a small tea-pot, a slop-bason, a sugar-dish, and tea-canister, is sold for twenty dollars. The art of polishing marble, which this country abounds with of all colours, is carried on here by an engine moved by horses, or criminals taken out of the house of correction; and so well contrived, as to polish nineteen or twenty marble vessels of different shapes at the same time. They also here make very beautiful snuff-boxes of yellow and white plaster.

Culmbach, the second of the six head towns, as they are called, and formerly the residence of the margraves, is seated in a fertile and beautiful valley on the banks of the White Maine; and is also the seat of the prefecture captainship of Culmbach, of a superintendent, revenue and cloister-office. This town has frequently suffered greatly by fire.

Erlang is seated near the Rednitz, which at this place receives into it the Schwabach, and consists of two towns, the Old and the New; the latter of which is also called Christian Erlang. Old Erlang is very antient, and about four hundred paces in length, but not near so wide; it has a peculiar magistracy of its own, and a Lutheran church. New or Christian Erlang began to be erected

in the year 1686, by the margrave Christian Ernest, from whom it received its name: it lies close to Old Erlang, and is distinguished from it only by the straitness of its streets. This is one of the finest towns in all Germany. The houses in the principal streets are all of them two stories high, except those at the corners, which are three stories. It has a square eight hundred paces each way, and a market-place a hundred and ten paces in length and breadth, the east side of which is taken up with the palace of the margrave, which is built of free-stone, and is three stories high. Behind it is a large and beautiful garden, planted with rows of chestnut and lime-trees, ever-green hedges, fountains, and statues. Here is a Lutheran church, which is a very handsome building, together with one for the French Calvinists, and another for the German Calvinists. Here is an university, which has a church of its own. The French refugees have set up some considerable manufactories in this town, among which those of stockings and hats are the most profitable.

Round the town are vast numbers of firs, and instead of vineyards and corn-fields are plantations of hops and tobacco.

S E C T. IV.

Of BRANDENBURG-ANSPACH.

Its Situation, Produce, and Rivers: the Trade and Religion of the Inhabitants: the Offices of the Government: the Revenues and Forces of the Prince; with the principal Towns.

THE principality of Anspach, Ansbach, or Onolzbach, is bounded on the north by the country of Schwartzenburg and the bishopric of Bamberg; on the east by the territories of Nurenburg, and a part of Bavaria; on the south by the bishopric of Aichstadt, and a part of the circle of Swabia; and on the west by the counties of Hohenlohe and Limburg, the territory of the imperial city of Swabian Hall, the domain of the Teutonic order, and the bishopric of Wurtzburg.

This country has some sandy and mountainous tracts; but is in general more fertile than Bareith, it abounding in corn, fruit, and tobacco; and all along the Maine are vineyards that produce good wine. The richness of the pastures render the breed of cattle excellent. There are likewise plenty of game and fish. In the earth are quarries of marble and iron mines.

The principal river in this country is at first called the Retzat, and rises partly in this country, where it is termed the Under, or Franconian Retzat, and partly in Swabia, where it is termed the Upper or Swabian. Both these rivers here unite their streams, and then obtain the name of Rednitz, which afterwards receives the Pegnitz; after which some give it the name of Regnitz, while others still call it the Rednitz. The Altmuhl rises in Brandenburg-Bareith, and passes into this country. The other rivers are the Jagst, or Jaxt, the Wornitz, or Wernitz, the Sulz, and the Tauber.

The inhabitants subsist by the breeding of cattle, by tillage, and by the culture of their vineyards and plantations of tobacco. In the towns various branches of mechanic arts and manufactures are carried on, as the weaving of tapestry, cloth, stuffs, gold and silver lace, and stockings. The making of porcelain, looking-glasses, leather, wire, needles, &c.

The inhabitants are of the Lutheran religion, and their clergy are divided into nine decanates; but at the city of Schwabach is a colony of French Calvinists, who have a church.

Of the family, title, and arms of the reigning margrave of Anspach, we have given an account in treating of Bareith; and we have only to add, that he, as well as the margrave of Bareith, has, on account of this principality, a seat and voice in the council of the princes of the empire, and is also co-summoning prince of the circle of Franconia.

The princely colleges or offices of state are the privy-council, the aulic and regency-college, as also that of the council of justice, the court of appeals, the chamber and

provincial council-college, the war council-college, the chief-court, and the consistory and matrimonial courts.

The yearly revenues of the prince are estimated at near a million of guildens, and his military force consists of a life-guard of horse, and one regiment of foot of seven companies.

This principality contains sixteen boroughs and seventeen market towns, the principal places in which are,

Anspach, or Onolzbach, in Latin Onoldum and Onoldinum, the princely residence and capital city, is situated on the Under Retzat, and is the seat of the abovementioned colleges, of the Aulic revenue office, and of a mint. The palace of the prince was chiefly built by the margrave George Frederic in 1587, and 1588; but suffering considerably by fire in 1710, was partly rebuilt in a much more beautiful manner than before, and also enlarged by the addition of some new and grand edifices. The public library was founded by the margrave Charles William Frederic in 1738. The princely chancery and regency-chamber are fixed in the old buildings belonging to the foundation of St. Gumbrecht, which have been repaired. This foundation was erected by one Gumbrecht in the eighth century, as a Benedictine monastery; but in the middle of the eleventh century was converted into a foundation of canons, and in 1563 secularized. In St. John's church is to be seen the new burying vault of the princes; this, with the new building of the Gymnasium Illustre Carolinum opened in 1737, the Jews school, and other public buildings, are to be seen in what is properly called the city. Without it are the porcelain manufacture, with the prince's garden and pleasure-house. Behind Jager-street, which is well laid out, lies a large and beautiful garden belonging to the court, in which is a fine green-house and orangery. In one of the suburbs is the church-yard of the Holy Cross, and in another the spital, the orphan-house, and the widows-house.

Schwabach is situated on a fruitful spot by a river of that name, and, though not large, is very populous. It has a Lutheran parish church, an hospital with a church in it, and a Latin school. The French Calvinists have also a church here, and the Jews a school. In the market-place is a fine fountain adorned with cascades and jets of water. The mint is commodiously laid out. The new suburb before the Zollner-gate is built with great regularity. There was formerly a letter foundry here, in which were cast the Schwabach letters, which in the German tongue answers to our Italic; these were invented and took their name from this place. Here are artificers in gold and silver lace, workers in Leon or Spanish steel, iron wire-drawers, brass turners, model cutters, needle-makers, who make above thirty different sorts of needles, which are much admired, and exported to a great distance, stocking-weavers, tapestry-weavers, and cloth manufactories.

The Hofmark Furth is a large commercial and populous town, situated on the river Rednitz. It is built irregularly, except the new streets; but contains many grand and fine houses. In this town reside an uncommon number of mechanics and artists: those who cannot be received into the fraternities at Nurenburg, settling here, where every one is sure of being well received. The Jews, who are very numerous, constitute one third of the inhabitants, and have a great school in the printing-house. The inhabitants are partly subjects of Brandenburg Anspach, partly of Nurenburg, and partly of the chapter of Bamberg.

S E C T. V.

Of the Imperial City of Nurenburg, its Government and Territories.

NURENBURG, or Nuremberg, a large and beautiful city, situated on the river Pegnitz, in the forty-ninth degree forty-one minutes latitude, and in the eleventh degree twelve minutes east longitude, is the capital of the republic of the same name, and besides four other towns, namely, Altdorf, Hersbruc, Lauff, and Graffen-

Graffenberg in the Upper Palatinate contains under its jurisdiction five hundred villages. This city contains one hundred and twenty-eight large streets, forty lanes, and is adorned with twelve large and one hundred and thirty-three small fountains. It has also sixteen churches, forty-four religious houses, twelve bridges, six of which are of stone; ten market-places, three hundred and sixty-five towers, and about twenty-one thousand houses, said to be inhabited by seventy-five thousand families; and the Pegnitz, which runs through the city, puts in motion about one hundred and sixty mills of different sorts within the territory of Nurenburg.

The houses are generally very lofty, built of hewn stone, and adorned with pictures on the outside. The streets are broad, clean, and well paved, but not straight. The castle is seated on a high rock; but all the rest of the city lies upon a level, and in one of the halls of this castle are to be seen four Corinthian columns forty-five feet high, which it is pretended were brought from Rome by the devil, upon a challenge made him by a monk.

The ornaments used at the anointing of the emperors are preserved in the church of the hospital, among which is the diadem of Charlemagne, termed the *insula*, which is of pure gold, weighing fourteen pounds, and is covered with precious stones. It is not closed on the top, as the imperial crowns are generally represented. The sceptre and globe are of gold, and the sword is said to have been brought from heaven. The robe of Charlemagne is of a violet colour, adorned with pearls, and the imperial cloak is edged with them, scattered over with eagles of gold, and a great number of precious stones. Here are also the cope, the stole, and the breeches adorned with jewels, the stockings and the buskins covered with plates of gold.

Among several other relics, they keep in the church of the hospital the iron head of St. Longinus's lance; and as they are sensible that it is shewn in above ten other places, they maintain that all those are counterfeits, and that their's was found by St. Andrew, and brought from Antioch to this city: indeed, they have the bulls of five popes to vouch for its authenticity.

The arsenal here is one of the most famous in Germany. In the two great halls, each of which is two hundred and fifty paces long, are three hundred pieces of cannon, among which are many of a very large bore, the biggest of them carrying a ball of three hundred pounds weight; but most of these arms serve only for shew, they being of greater antiquity than use.

The public library is in a cloister that formerly belonged to the Dominicans, and is said to contain twenty thousand volumes. The most ancient manuscript is nine hundred years old; this is a copy of the Gospels, with the prayers and hymns used in the Greek church.

The town-house is a very large edifice of hewn stone; the front is very fine, and has a noble portal in the middle, adorned with several statues; and the architecture of the whole is regular, and in a good taste. There are two other very grand gates at equal distances, that are no less splendidly ornamented; but this building is too much crowded, it has no court before it, and that behind is so narrow, that it scarcely deserves to be called one. There is an ascent up a very indifferent stair-case to a long gallery, upon the ceiling of which is represented in relieve a famous tournament held in this city about three hundred years ago. In one of the chambers deputies from the circle of Franconia meet every day on the affairs of the province. Over the door of this chamber is a picture, which contains the portraits of the three brothers John George, Frederic, and John Christian, princes of Saxony, who supported Luther in promoting the reformation. The tapestry of this chamber contains the history of Nebuchadnezzar, in six pieces. Among the several pictures in the many chambers of this building are, a large painting which represents the homage rendered by the magistracy of Nurenburg to the emperor Leopold; a very ancient Madona, given by Frederic elector of Saxony; a St. Luke painting the virgin Mary; Adam and Eve by Albert Durer, which is highly esteemed: here Eve presents the apple with a very arch insinuating smile; another picture by Albert

Durer, in which are the saints Peter, Paul, John, and Mark; the murder of Abel by Preisler, where Cain kills his brother with a large flint stone; the history piece of Esther and Ahasuerus, a fine picture much esteemed; but Ahasuerus has the face and dress of king Francis I. and the queen is dressed like the ladies at Nurenburg. In the council-chamber, which is very small, is a picture of the last judgment, said to be six hundred years old, in which Joseph is painted in the habit of a Carmelite.

The city of Nurenburg is divided into eight parts, and one hundred and thirty-one captainships: I. The quarter at the wine-market, which is divided into thirteen captainships. Here is the parish church of St. Sebald; in which the principal things to be seen are the brass monument of St. Sebald, with the creation of the world by the celebrated Albert Durer, who was a native of Nurenburg. The Latin school near it is supplied with eight teachers.

II. The quarter at the milk-market, which contains fourteen captainships. In this quarter is the imperial fortress, seated on a mountain. What is most remarkable here is the emperor's chapel, with the old tower belonging to it, as also the chapels of St. Walburg and St. Margaret, together with the observatory. The church of St. Mary, which is also called the Predicant, or Dominican church, in which is kept the great library belonging to the town. In this part also stands the chapel of St. Maurice.

III. The quarter at the Gilben-hof, which consists of fourteen captainships; there is here St. Giles's church, which is built in the modern taste, and is the finest in the whole city. In an old cloister near it is a seminary, in which the upper classes are under the care of a certain number of professors, and the lower under one rector and four preceptors.

IV. The quarter at the salt-market, which contains twenty-two captainships. Here is the council-house just described, with the church of our Lady. Near the Spital, in which four hundred people are constantly maintained, is the church of the Holy Ghost.

V. The quarter near the Bare-footed Fryars contains in it twenty-one captainships, in which is the parish-church of St. Laurence, near which is a Latin school under the direction of eight teachers. In this quarter is the church of the Bare-footed Fryars, an hospital for foundlings, the church of St. Catharine, that of St. Martha, with a small hospital, the church of St. Clare, and the building belonging to the academy of painting.

VI. The quarter at the corn-market consists of seventeen captainships, containing the church of St. Salvatore and the arsenal, which contains two hundred and seventy-four brass cannon, and two of iron, with small-arms sufficient for eighteen thousand men; the largest cannons are forty-eight pounders, except two pieces of ordnance that carry balls weighing eighty pounds. One of the cannons is charged at the breech, and may be fired eight times in a minute. Here are also fifty field-pieces that are called by the names of the twenty-four letters of the alphabet, the twelve months, the twelve signs of the zodiac, and of Mars and Pallas. The small-arms are very beautifully disposed in columns, shields, trophies, suns, and the arms of the city; being curiously arranged, like those in the Tower of London. All these implements of war are kept in two large halls, one of which is a hundred and seventy, and the other two hundred and twenty common paces in length.

VII. The quarter near the Carthusians consists of fifteen captainships, and contains the church of Marienzell and the chapel of the twelve apostles.

VIII. The quarter near St. Elizabeth consists of fifteen captainships. Here is the church of St. James, a Latin school, which has three masters, and the Teutonic-house, which is the residence of the commandery of Nurenburg. In the church of St. Elizabeth in this quarter the Teutonic order celebrate their form of worship, and the deacons of St. Jacob have their mass or hours of prayer there every day early in the morning.

One of the greatest beauties of this city is its fountains; these we have just mentioned; but it will be proper to give a more particular account of them. In the new square are three fountains, the most remarkable of which

which is that in the middle. In a large oval basin is a rock, on the top of which four large dolphins spout water, and support a large shell, out of which rises a triton, which jets a plentiful stream into the air, through his marine trumpet, and from the bottom of the basin rise four smaller water-spouts, which throw their water into the triton's shell, through the hollow slopings of which it returns into the basin. The whole is inclosed within a fine iron balustrade.

Our author mentions another magnificent fountain, which when he was at Nurenburg was nearly finished, but not erected. In the middle of a vast marble basin, says he, will be placed a large rock, in which are two caverns opposite to each other. From these grottos spring with great fury two sea-horses, of brass, with riders, who manage them with large sea-reeds. Above these grottos are little infants of the same metal, each sounding a marine trumpet. Upon the rock sit two naiads, with oars in their hands, in large basins, and four dragons mounted by little children. All the figures are of brass, as big as the life, and the attitudes admirable. Out of the middle of this rock rises a pedestal, adorned with festoons composed of coral and various shells, with cartouches, &c. and with all these ornaments are intermixed some dolphins heads. The finest figure in the whole is a Neptune standing on the pedestal. This beautiful statue is nearly ten feet high, and weighs two thousand two hundred pounds. This fountain will throw out two hundred hogheads of water in an hour, and is valued at between thirty and thirty-five thousand crowns.

Among the stone bridges is one of a single arch, fifty paces in length, over the river Pegnitz. At one extremity is a large flesh-market, built of hewn-stone, and on its gate is a vast ox of stone lying on its belly, with gilt horns and hoofs; under which is a Latin couplet in gold letters, "that every thing has its beginning and increase; but the ox you see here never was a calf."

On the new bridge, which is said to have cost the city a hundred thousand guldens, are two pyramids, on the apex of one of which is the imperial black eagle, and on the other a dove with an olive branch in its beak, with a distich in Latin to the following purpose:

"In passing over this bridge, dedicated to Charles, pray that his imperial race may flourish while the waters flow under it."

Here are many noble museums belonging to private persons, and which are visited by all travellers of taste and learning. There is also an anatomical theatre founded at the expence of the city, in which are about a hundred skeletons of different animals, especially of the winged species. This anatomical theatre, Mr. Keyser observes, is under the management of Dr. Treu, whose house is near it; and in his cabinet is a collection of about six thousand kinds of plants, several petrifications, a set of all kinds of seeds, some delicate and curious skeletons of leaves and fruit, and several pieces shewing the curious mechanism of the human body. In this museum is set up an elegant Latin inscription, which may be thus translated:

"Mortal, if ignorant of the structure of thine own body, and of that of the animals, &c. created for thy use, if thy sight be good, and thy mind inclined to knowledge, stop here a while. Hither, for thine, and his own benefit, an abstracted mind and curious hand has collected the skeletons of men, animals, and vegetables; with the various kinds and forms of minerals. Every particle of these is a kind of natural hieroglyphic, which delineates the infinite goodness, bounty, and glory of the Creator much more distinctly than those invented by the Egyptians; and at the same time teaches thee to celebrate the unsearchable power of the Deity, to admire the inimitable and wonderful formation of all things, to confute the absurdity and obstinacy of the wicked atheist, to observe the sudden change of vain beauty into loathsomeness, and from thence, and the frailty of human life, to learn true wisdom."

It is remarkable that the principal clocks in this city strike the hours from one to twelve progressively from the rising of the sun, and begin again after sun-set, which at

first puzzles strangers; but by the table of the equation of time published here, this may be easily reduced to the common method of calculation.

There are several other customs which seem very extraordinary, particularly the manner of celebrating marriage: the bridegroom, attended by his relations and friends, walks to the church, and is soon after followed by the intended bride and her friends. Mr. Misson, who was present upon one of these occasions, says, that on their entering the church the bridegroom sat down with his relations on one side, and the bride on the other opposite to him; and over each of their heads against the wall was painted the figure of Death. From thence they both walked up to the minister, who stood in the midst of the choir; and he had no sooner performed the ceremony, than four or five trumpets sounded from the top of the steeple. Upon this the new-married couple returned in the same manner to the place from whence they came.

The bridegroom appeared all in black, with a cloak trimmed with lace, with a large ruff, and a little crown of gold plate lace upon his periwig. But the bride's dress is not so easily described: the best way to form an idea of it is, to fancy a head-tire composed of gilt wire like a bob periwig half a foot higher than the forehead, and frizzled out on the sides; these threads or wires are so close together, that there is no more distance between them, than is just sufficient to fasten to them an infinite number of very small, thin, round plates of gold, which hanging both within and without waved with the least motion. Her habit was a kind of black vest with long skirts; but the body was very short, and had the seams covered with gold lace, as the skirts were with small knots of black satin ribbon. She had straight sleeves and cuffs that reached down below her wrists. About her neck she wore a handkerchief of very fine lace shaped before like a clergyman's band, but reaching down to the middle of her back, ended in a point. She had also a gold chain about her shoulders, and another about her waist, instead of a girdle. The petticoat was pretty short, and trimmed towards the bottom with black bone-lace and gold fringe. This bride danced at the wedding with one of the senators, who wore a great ruff. Indeed the customs I observed, says our author, at this feast were so very different from any I had seen before, that I rather fancied myself in China than in Europe.

Nurenburg boasts of having better artizans, and in greater numbers, than most cities in Europe: particularly the curious works made here in wood, ivory, alabaster, and even of paper and starch, are very famous; and those who are fond of mechanical arts and manufactures, may here abundantly gratify their curiosity. The toys of Nurenburg are indeed exported all over the world; but their trade is not now so considerable as it was formerly.

The few Calvinists here have a preacher of their own, and perform divine service out of the town, in a house seated in a garden, and fitted for that purpose. The papists are allowed the public exercise of their religion in the Teutonic-house: but the Jews are obliged to live in a village near the city, from whence they have the liberty of coming daily into the town, on paying a small piece of money; but they are not suffered to stay all night, and must therefore return before the gates are shut.

The nobility here took their rise in 1198, when the emperor Henry VI. assisting at a tournament, raised thirty-eight burghers families to the degree of nobility. The council of Nurenburg consists of thirty-four noble and eight handicraft counsellors. The former are divided into twenty-six burgomasters, and eight old senators, called Alt Genanten. These twenty-six burgomasters consist of thirteen old and thirteen young ones, and every four weeks an old and a young one preside. Out of the thirteen old burgomasters are chosen the seven first counsellors, who are stiled the septemvirate, and manage the most important and secret affairs of the city; together with the six next to them, who compose the council of appeal. Of the former the three first are stiled the supreme head people, and are always imperial counsellors:

and

A Nuremberg Marriage.

and the first of these is also imperial bailiff; he resides at the imperial fort, and is stiled the castellan. Out of the thirteen younger burgomasters, as well as out of the older ones, all the offices of the government are filled up. The eight counsellors chosen out of the tradesmen go annually at certain times to council; and these are selected from the goldsmiths, the brewers, the tanners, the taylor, the cutlers, the clothiers, the bakers, and the furriers, who are nominated the lesser council. The great council, which must consist of two hundred persons, is composed of those elected by the burghers.

The judicatories in Nuremburg are the appeal and upper court, together with that of the town and marriage-court; the country peasant-court; the under-court, instituted for the recovery of small debts; the quinquevirate-court, for the reparation of injuries; the forest-court, belonging to the wood of Sebald; the forest-court of Laurence wood; and the wild honey-court in the latter.

The jurisdictions here are the bailiff-office, the tax-office, the administrative office for the county, the war-office, the supreme guardian and ecclesiastical-office, the building-office, the toll-office, the brewery-office, the office for levying of toll upon wine, the pawn-office, or lending-house, the corn-office, the censor-office, established for the government of the artisans, the tallow-office, the rent-master's-office, the sheriff's or inquisition-office, the office belonging to the town charity, the arsenal-office, the chest-office, the mint-office, and several others.

The military force of this town consists of seven companies of foot, each of which in time of peace contains a hundred men, but in time of war a hundred and eighty-five; of two troops of cuirassiers, each consisting of eighty-five men; and two companies of invalids, amounting to two hundred and twenty-six. Besides these, which are regular troops, the burghers form themselves into twenty-four companies of about three hundred and fifty men each, who are all well disciplined, and go through the several evolutions and manual exercise with great exactness and activity. Two hundred men also belong to the train of artillery; and the city selects two troops of horse out of such of the burghers as are remarkable for their height and comeliness. The latter, on the breaking out of a fire in the city, have their particular stations assigned them, to which they immediately repair; and the men belonging to the artillery secure the arsenal. They have here an excellent regulation with respect to fires, in order to excite the people to activity and vigilance; a ducat is given as a reward to that person who brings the first pail of water, two guildens to the second, one gulden to the third, eight grosches to the fourth, and to every one of the rest fifteen cruzers.

The tract called the Nuremburg circle is surrounded by the rivers Schwartzbach, Pegnitz, and Schwabach, to which the Nurembergers give the title of the border-waters. It comprizes within it two considerable imperial forests, called the Sebald and Laurence forests, which are covered with pines; and in this compass are a considerable number of towns subject to Nuremburg, one of the principal of which is

Altorf, or Altdorf, a small town that consists principally of one large street, and several little ones. At the parish-church a professor of divinity always preaches, and the two deacons belonging to it are likewise professors of divinity. The citadel is an ancient stone building, that has twelve large courts, in which the administrator of Altorf resides. Here is also an university; the building consists of three stories, and has two wings; and contains in it a valuable library, an anatomical theatre, a chemical laboratory, and an observatory. Without the town is a large botanical garden, which is kept in good order.

S E C T. VI.

Of the Bishopric of Aichstadt; its Situation, and Rivers. The Arms of the Bishop, and the Offices by which the Government is administered; with a Description of the City of Aichstadt. Of the Teutonic Order, and particularly the

Masterdom of Mergentheim; with an Account of that Town.

THE bishopric of Aichstadt, or Eichstett, terminates on the Upper Palatinate, Upper Bavaria, the duchy of Neuburg, the county of Pappenheim, and the principality of Anspach, by which also several detached parts of it are surrounded.

The principal rivers by which this country is watered are the Altmuhl, which flows out of the principality of Anspach, and here receives the little rivers of Anlauter, Schwartzach, and Sulz; after which it enters Bavaria. The Upper and Under Retzat also runs through some parts of this bishopric.

The episcopal title is, By the grace of God, bishop and prince of Aichstadt.

The episcopal arms are a crossier argent, in a field gules. A bishop's mitre crowns the shield, and behind it appears a sword and crossier.

These bishops formerly stiled themselves arch-chancellors of the holy see of Mentz, and maintained that, in virtue of this dignity, they had several privileges during the vacancy of that archbishopric. The bishop of Aichstadt is perpetual chancellor of the university of Ingolstadt. He sits in the council of the princes of the empire, on the spiritual bench, between the bishops of Worms and Spire, and at the diets of the circle of Franconia between the reigning margraves of Brandenburg-Bareith and Anspach.

The chapter consists of fourteen capitulars and fourteen domicelli, who must be all of a nobility suitable to the foundation, and swear to sixteen degrees of descent.

The principal offices here are the spiritual council, the regency, the aulic council, and the aulic chamber.

The inhabitants are of the popish religion. The episcopal territories are divided into eleven upper prefectures, the principal place in which is

Aichstadt, or Eichstett, the episcopal residence, which lies in a valley on the banks of the Altmuhl, in the forty-eighth degree fifty-six minutes north latitude, and in the eleventh degree ten minutes east longitude. It has an ancient cathedral, to which one of its bishops presented a fine pyx for the host, which is of pure gold, in the form of a sun, and weighs forty marks; it is adorned with several diamonds, rubies, and other precious stones; the whole being valued at sixty thousand guilders. Besides the great choir, there is the choir of St. Willibald, in which it is pretended the bones of that saint were found in the year 1744, in honour of whom John Anthony II. caused a new and expensive high altar to be raised, which was dedicated in 1745. At St. Walburg's church is an high altar as broad as the church itself, and above it is a small cavity, the sides and bottom of which are lined with gold, and covered with a stone. This is called the coffin, and is said to contain the breast-bones of St. Walburg, out of which an oil is said to flow and force itself through the stone, where it is collected in drops, which are received into a golden trough, and from thence conveyed into a golden bowl, and deposited in small vials for the use of pilgrims and benefactors resorting thither, and employed in miraculous cures. This holy flux happens twice a year, that is in the spring and fall; but it frequently appears at different seasons. To this church belongs a Benedictine nunnery. In this town is also a college of Jesuits, a parochial and collegiate church of our Lady, in which is a foundation consisting of a provost, a dean, a cathedral and town minister, and some canons. Here is also a Dominican convent, a cloister of regular canonists of the congregation of our Lady, a Capuchin cloister and church in the east suburbs, and another church dedicated to the Holy Ghost.

We shall now give an account of the Teutonic order in general, and in particular of the masterdom of Mergentheim.

The Teutonic order was founded in Palestine in the year 1190, and those who entered into it were called knights of the virgin Mary, or brothers of the Teutonic house of our Lady of Jerusalem. They bound themselves by a vow to defend the Christian religion and the Holy Land, and to serve the poor and sick; to be all of them

them Germans, and of true antient nobility. The knights of this order were driven from Jerusalem by the Saracens, and afterwards gradually subdued all Prussia, Courland, Semigallia, and Livonia; but again lost those countries.

The superior of this order, or the grand and Teutonic master, styles himself administrator of the grand masterdom of Prussia, master of the Teutonic order in Germany and Italy, and lord of Freudenthal and Eulenberg. He is a spiritual prince of the empire, and enjoys a high rank in the council of the princes, sitting on the spiritual bench next after the archbishops, and preceding all the prelates; but in the circle of Franconia, he is the last of the spiritual princes.

The arms and ensigns of this order are an erect cross sable in a field argent, granted by pope Celestine III. In the field is a cross or, conferred by king Henry of Jerusalem, and in its center is seen the imperial eagle bestowed by the emperor Frederic II. On each of the four corners is a lily or, which was added to these arms by St. Lewis of France.

These knights must be of old German nobility, and prove their descent. Both the protestants and papists may be invested with the order, and the protestant knights are permitted to marry. On solemn occasions the knights wear a white mantle with a black cross upon it, edged with silver; but their dress in other respects resembles that of other seculars, though it is not ornamented, or of the gayest colours.

Did the signories and estates which the Teutonic order still possess in Germany lie contiguous, they would form a considerable principality. These estates consist, in general, of what is properly called the masterdom of Mergentheim and twelve bailiwics.

The regency at Mergentheim is composed of a vice-stadtholder, presidents, house commendaries, and purveyors, with a certain number of privy, regency, spiritual, and chamber counsellors.

To the circle of Franconia belongs only the proper masterdom of Mergentheim, and the bailiwick of Franconia, the principal place in which is,

Mergentheim, Mergenthal, or Marienthall, a small city seated on the Tauber, twenty-five miles to the south-west of Wurtzburg; the residence of the grand master of the Teutonic order, and also the seat of the regency. In this town is an academy, and a seminary. Here is also a rural deanery belonging to the ecclesiastical jurisdiction of Wurtzburg, and on a mountain near the town stands a citadel, in which the grand master usually resides. It was taken by the Swedes under the command of general Horn in 1681; but was soon after retaken by the French and the duke of Saxe-Weymar; but has been since restored to its antient proprietor, the grand master.

SECT. VII.

Of the Counties of Hohenlohe, Wertheim, and Erbach. Their Situation, Extent, Produce, and Rivers; with a concise Account of the Princes of each, their Arms, Government, and principal Towns.

THIS country borders on the masterdom of Mergentheim, the bishopric of Wurtzburg, the principality of Anspach, the territories of the imperial cities of Rotenburg and Swabian-Hall, the dutchy of Wurtemberg, and a part of the electorate of Mentz. Its greatest extent from east to west is about eight and twenty miles, and from north to south about thirty. It was antiently much larger, and formed nearly one third of all Franconia.

The south side of the country furnishes the traveller with a prospect of fine vineyards, which, in some places, join to each other for several miles together. The north side is proper for agriculture, and on the tops of the mountains are commonly found valuable woods of oak, fir, pine, beech, and birch, in which a variety of game find shelter; and in the valleys is good meadow ground, which feeds an excellent breed of cattle.

The principal rivers are the Kocher, which issuing out of the territory of the imperial city of Swabian-Hall, enters the county of Hohenlohe, and runs into the dutchy of Wurtemberg. The Jagst, which flows into this country from the principality of Anspach. The Tauber, and the Wernitz, both which rise in this country.

With respect to the religion of this country, it is necessary to observe, that the reformation which was begun here in 1540, was thoroughly completed in 1556, and ever since the whole country has been of the Lutheran church. But in 1667, count Lewis Gustavus embracing the Romish religion, and his elder brother count Christian of Hohenlohe-Bartenstein, soon after following his example, the protestants were oppressed, and suffered various grievances, which have been in a great measure removed by the interposition of the empire.

The counts of Hohenlohe are of a very antient family, and are divided into the principal branches of Neuinstein and Waldenburg; the former is also subdivided into those of Weckerheim, and Lagenburg, and the latter into those of Pfedelbach and Schillingsfurst. The whole of this capital line was raised in the year 1744, to the dignity of princes of the empire; but tho' the princely dignity was at the same time offered to the collateral branches of the line of Neuinstein, they have as yet scrupled to accept of it.

The princes of the younger Waldenburg capital line, style themselves princes of the holy Roman empire, counts of Hohenlohe and Waldenburg, lords of Langenburg, &c. but the counts of the elder Neuinstein line, style themselves counts of Hohenlohe and Gleichen, and lords of Langenburg Cranichfeld, &c.

The arms of the princely capital line of Waldenburg are, for Hohenlohe, a shield quarterly, in whose first and fourth quarters argent, are two leopards sable, running directly against each other: and in the second and third upper quarters, a lion advancing and crowned or, with an open throat, a red exerted tongue, and a double rolled up tail, in a field sable; and in the lower ones, on account of Langenburg eight rustres sable, in a field or.

The arms of the Neuinstein capital line, are also a shield quarterly, in whose first and fourth quarters are to be seen in a field argent two leopards sable running at each other; and in the second and third, above, a lion crowned or, in a field sable, and below it eight rustres sable in a field or. In a middle shield is a lion crowned or, in a field verte.

At the diet of the empire the princes and counts of Hohenlohe belong to the Franconian college of counts; and at the diet of counts are possessed of six voices with the right of precedency in the Franconian college; but at the Franconian diets they have only two voices, which follow directly after those of the princes.

This county contains in it ten cities, three market-towns, and twelve citadels, the principal place in which is,

Oringen, the capital of the country, seated on the rivulet of Ohrn, which runs between the old and new town. One half of this place belongs to the Oringen line, and the other to the whole princely line of Waldenburg. The former resides at a magnificent castle in this city, to which adjoins a beautiful pleasure garden. The building called the stone house is a grand structure enclosed by a wall, with a spacious court before it, and belongs to the princely line of Waldenburg. At this place is also a building allotted for the residence of the countess dowager. The churches and preachers are also in common. Of the former there are two, the principal church, and that of the Spital. The Lazar-house has a chapel, and the burial-place without the town has also a church. The seminary here was in the year 1735 formed on the plan of a Gymnasium Illustre. In this town are also kept the common archives. In the neighbourhood of this city are several eminences that yield excellent fruit, and fine wine.

The county of Wertheim, which we shall next describe, lies between the archbishopric of Mentz, and the bishopric of Wurtzburg, a part of it being also bounded

by

by the county of Erbach. The Maine runs through it, and in this county receives the Tauber. It produces a variety of fruit, and of the grapes a good wine is made.

At the diet of the empire the princes and counts of Lowenstein Wertheim, are possessed, on account of this county, of two voices in the Franconian college of counts, and at the circle of Franconia, they enjoy a seat and voice between Castell and Rieneck.

The capital of this county is Wertheim, which is seated on the Maine; where it is joined by the Tauber. It contains two residentiary palaces, and also a parish church, which both the Lutherans and Roman catholics make use of in common; and also a Latin school. The magistracy here are, however, all Protestants.

The county of Erbach is seated on the Odenwalde, and is surrounded by the archbishopric of Mentz, the electoral palatinate, and a part of the county of Wertheim, extending about twenty-four miles in length; and about nineteen in breadth.

It is a mountainous country; but well cultivated and pretty fruitful. The more barren lands are sometimes suffered to rest between five and ten years, after which the bushes, heath, and whatever else they are over-run with, are cut down in time of harvest, dug up by the roots, and these, with a part of the turf, being laid together on heaps, as soon as they become dry, are set on fire, and the ashes being spread abroad, the land is ploughed up and sown; by this means the land is rendered fruitful, and the inhabitants procure a sufficient quantity of corn for their subsistence; they cultivate abundance of potatoes, and also prepare a great deal of pot-ash. The forests, however, become thin, and many pieces of ground which were formerly covered with woods, have been converted into arable land; but at present they begin again to plant trees. The best pastures and meadows lie in the valleys, and the breeding of cattle is here pretty considerable.

This country has some good quarries of stone and marble, and it has also some good mines of iron.

The rivulets which rise in this country, among which the Mumling is the principal, all discharge themselves into the Maine, the Rhine, and the Neckar, and abound in fish.

The inhabitants amount to near twenty-four thousand souls; they are of the Lutheran church, and export fine meal made of spelt, with oats, buck-wheat, wood, coals, pot-ash, cattle, iron, nuts, honey, and wax. The wool produced here is manufactured into cloth.

The county of Erbach is for the most part a fief of the elector Palatine, and on the raising of the house of Erbach to the dignity of counts, the feudal rites were expressly reserved to that of the elector. These counts are possessed of two voices at the diet of the empire in the college of the counts of Franconia.

Within this county are nine prefectures, one of the principal places in which is,

Erbach, an old citadel, and a small town situated on the Mumling, in a narrow valley amidst high mountains, and contains only a few houses which stand by the citadel, and are surrounded with a wall; but other houses have been built on the out-side of this wall, which have the appearance of a suburb; but the place is so inconsiderable as to have only one church. At a small distance from the town is the village of Erbach; through this place runs a rivulet, which in a meadow near the town, sinks into the earth, and passes through a mountain, on the other side of which it issues out again, and at length runs into the Mumling.

S E C T. VIII.

Of the Counties of Henneberg and Schwartzenberg, with a concise Account of the free imperial City of Rottenburg.

THE county of Henneberg is bounded on the east by Coburg; and Schwartzenburg; on the north by Gotha and Eisenach; on the west by the landgrave of Hesse, and the bishopric of Fulda; and on the south by the bishopric of Wurtzburg, extending from

north to south near twenty-eight miles, and from east to west about twenty-five.

In most of its districts the inhabitants apply themselves to agriculture, with tolerable success, and in some places cultivate tobacco. It has mines of silver and copper; but those of iron are by far the most numerous. In some parts of this county salt is made, and it has also some medicinal springs.

The principal river is the Werra, which after its entering into this county, divides itself into two parts, and receives into it several small streams.

No other religion than that of the Lutherans is tolerated here, except at Schmalkalden, where is a church belonging to the Calvinists.

The manufactures of this county chiefly consist of fustian, and the making of arms and hard-ware.

At present the princely county of Henneberg has the following lords for its possessors, namely, the elector of Saxony, the dukes of Saxe-Weimar, Meinungen, Gotha, Coburg Saalfeld, and Hilburghausen, and the landgrave of Hesse-Cassel.

The principal places in this county are the following:

Schleusingen, formerly the residence of the princes of Henneberg, and at present the seat of the electoral Saxon superintendency, is seated on the little river Schleufz, forty miles to the north-west of Bamberg, at the foot of a hill, upon which are the ruins of a castle or palace. The town is not large, and on account of the adjoining Thuringian wood, has but little land fit for tillage; it has, however, a seminary, which belongs in common to all the dukes of Saxony, who are possessed of any share in this county. Schleusingen also contains a commandery belonging to the order of St. John, founded in the year 1291.

Meinungen, or Meiningen, a town seated on the river Werra, amidst high mountains, which duke Bernhard of Saxony, on his obtaining it in 1681, chose for his residence; and caused a new palace, with a chapel to be built, naming it from his consort Elizabethenburg. In this palace are the princely library, a cabinet of medals, and the archives of Henneberg, which belong in common to the princely and electoral houses of Saxony. In this town is one parish church, a Latin school, an orphan-house, a house of correction, and a spinning-house. It had formerly a very considerable manufacture of fustian, which is now less flourishing, and the burghers chiefly apply themselves to the culture of tobacco.

Smalkald, a town situated at the foot of the Thuringian wood, on a rivulet of the same name, which here receives into it the Stille. It is a pretty large, thriving, and populous town. On a hill near it stands the citadel of Wilhelmsburg, thus called from its being rebuilt by the landgrave William IV. In the center of the town stands an old palace of the prince of Hesse-Cassel, called the Hessenhof. In this town is also a collegiate church, in which were formerly twelve canons, with a town-church possessed in common by the Lutherans and Calvinists, and a Latin school. The salt-pits here, in conjunction with the neighbouring mines of iron and the forges, are of great advantage to the town, which has a considerable trade in hardware. The numerous meetings held by the protestant princes in this town, with the league they concluded here in 1531, and the theological articles drawn up by Luther, which they caused to be confirmed by their teachers, have rendered this town famous in the German history.

The county of Schwartzenberg is for the most part surrounded by the bishopric of Bamberg, the county of Castell, the signiory of Speckfeld, the principalities of Bareith and Anspach, and the bishopric of Wurtzburg. This county in its greatest extent is about nineteen miles long; but in some parts it is only two miles, tho' in others about three miles broad. The inhabitants of this narrow slip of country are partly of the Lutheran and partly of the Romish church.

The prince of Schwartzenberg is possessed of several other districts in Bohemia and Stiria. His title is prince of Schwartzenberg, of the holy Roman empire princely landgrave in the Klettgau, count of Sulz, duke of Crumau, and lord of Gimborn, of the holy Roman empire

pire hereditary aulic judge of Rothweil, and lord of the signiories of Murau, Wittingau, Frauenberg, Postelberg, Wildschutz, Worlic, &c.

His arms are a shield quarterly, the first and fourth fields of which are argent and azure, divided eight-fold lengthways for Schwartzenberg; and in the third and fourth quarter is a black raven picking out the eyes of a Turk's head, in memory of the fortress of Raab in Hungary, which was taken from the Turks by count Adolphus in 1598.

In this little district are six prefectures; but no town worthy of notice, most of them being villages, and the rest only little market-towns, with only one parish-church.

There are some other little districts in the circle of Franconia, as the counties of Castell and Reinec; the feigniories of Limburg, Seisheim, Reichelberg, Weissenheid, Welzheim, and Hausen, which, though their possessors have a seat and voice in the diet of the empire, are too inconsiderable to merit any farther notice.

There are also several free imperial cities in the circle of Franconia that have a voice in the diet of the empire, the principal of these, next to Nuremburg, which has been particularly described, is

Rothenburg, or Rotenburg, which is seated on an eminence by the Tauber, in the forty-ninth degree twenty-six minutes latitude, and in the tenth degree eleven minutes east longitude, thirty-five miles to the west of Nuremburg. It receives the water for its necessary uses out of the river Tauber, by means of an engine, by which it is forced up the mountain, and from thence ascends in a direct line to what is called the Klingenthurn, from which it falls down again, and produces three fountains in the town. Rotenburg is surrounded with walls that are fortified with towers, and defended by ditches. The inhabitants who are Lutherans have five churches in the city; but there is generally no preaching but in two of them, that is, in the parish-church of St. James, and in the church near the hospital. The academy here consists of seven classes, and the like number of teachers.

At the diet of the empire this city possesses the eighth place in the college of the imperial cities on the Swabian bench, and the second at the circle of Franconia on the bench of the imperial cities. To this city belong several villages.

C H A P. XVI.

The ELECTORAL RHENISH Circle, or the Circle of the LOWER RHINE.

S E C T. I.

Of the electoral Rhenish Circle in general; and first of the Electorate of Mentz: its Situation, Extent, and Produce. The Religion of the Inhabitants; their Arts, Manufactures, and Commerce. The Dignity, Titles, Arms, and Prerogatives of the Archbishop, and of the high Chapter of Mentz. The Offices by which the Government is administered; with the electoral Revenues and Forces.

THIS circle extends from the circle of Swabia, which bounds it on the south, to that of Westphalia, which lies to the north; to the east it is bounded by Franconia, and the lower part of the circle of the Upper Rhine; and to the west by the upper part of the circle of the Upper Rhine, Lorrain, and Luxemburg. It divides the circle of the Upper Rhine; but its extent is difficult to determine.

It includes the three archbishoprics and electorates of Mentz, Triers, or Treves, and Cologne, with the Palatinate.

The elector of Mentz is the summoning prince and director of the circle, the diets of which have ever since the middle of the seventeenth century been held at Frankfurt on the Maine. This is one of those called the anterior circles, which, in the years 1697 and 1702, entered into a mutual compact with each other for their defence against the attacks of an enemy.

With respect to religion, this circle is reckoned among the mixed.

The archbishopric of Mentz is seated on the Rhine, and is bounded on the north by Wetteravia and Hesse, on the south and east by Franconia and the palatinate of the Rhine, and on the west by the electorate of Triers; extending about fifty miles in length, and twenty in breadth.

This country affords sufficient subsistence for the inhabitants; for, besides corn and excellent wine, it produces fine garden-fruit, and plenty of cattle; in some parts are raised large quantities of flax and tobacco, and in others are iron mines.

The principal rivers with which this electorate is watered are, the Rhine, the Maine, the Jaxt, and the Lahn.

The countries seated on the Rhine and Maine, which, ever since the Reformation, have been in the power of

the elector of Mentz, have invariably adhered to the Romish church; but on the Eichsfeld, as also at Erfurt, Cronberg, and some other places, there are many Protestants; and at Bonnigheim the protestant worship is alone used. In several places the Jews are also tolerated.

In this archbishopric are some woollen and other manufactures, in some places looking-glasses, and in others fine porcelain is made; while in other parts the inhabitants apply themselves with great diligence to the cultivation of flax and tobacco. With respect to commerce, they carry on an important trade in wines, serge, linen, tobacco, almonds, chesnuts, nuts, &c. The late elector, John Frederic Charles, has not only established two annual fairs at Mentz; but has endeavoured to make commerce flourish both in that city, and in all the archiepiscopal countries; for which purpose commissioners of commerce are appointed there. The electoral exchequer of Lohnec expedites all mercantile affairs, and examines into complaints relating to exchange and all commercial subjects of dispute. The electoral magazine here has a president, four magazine masters, and two brokers.

The archbishop obtains his dignity by the free choice of the chapter, and must swear to an election-capitulation. The papal confirmation is very expensive; the pallium is also obtained at a high price, and the annalis, which each new archbishop is obliged to pay to the pope, amounts to ten thousand florins. This prelate is, however, the first archbishop in Germany, and the archiepiscopal dignity is inseparably connected with that of elector; and indeed he is esteemed the first among all the spiritual and secular electors.

His title is J. F. by the grace of God of the holy see of Mentz archbishop, of the holy Roman empire throughout all Germany arch-chancellor and elector, &c.

The archiepiscopal arms are a wheel argent, in a field gules, to which each elector also adds his family arms.

The elector of Mentz has great prerogatives with respect to the supreme judicatory of the empire. At the imperial aulic council the vice-chancellor of the empire, who is nominated by him, follows immediately after the imperial president. He has also the nomination of all the secretaries; and the imperial aulic chancery, which is appointed by him, expedites all matters of which cognizance has been taken. He likewise collects, and has the direction of the money received for all dispatches; keeps

the acts of the imperial aulic council, and the assessors of the elector are possessed of the first place among all those of their order. The chancery of the chamber-court is likewise appointed and regulated by him alone.

The high chapter of Mentz consists of twenty-four persons; that is, of five prelates, and nineteen capitulars. The former have the privilege of wearing a mitre; but the latter need not be priests, though they generally are. This chapter has several syndics and other officers. The electoral stadtholder, together with the presidents of the aulic council, with the chamber and town jurisdiction, are always chosen from among the capitulars; and in all stipulations with the neighbouring states, and other important affairs in which the privileges of the archbishopric are concerned, the consent of the chapter is also mentioned. A capitular is always vicar-general to the archbishop in spiritual matters. These capitulars must be born in the Rhenish province, and prove by oath their being descended from noble ancestors for six descents. At the electoral court of Mentz is held no regular privy-council; but important affairs of state are proposed in what is called the privy-conference. The privy-chancery consists of the aulic-chancellor, the privy-secretary, the secretaries, privy-registers, and privy-clerks of the chancery. The aulic council, or the electoral regency-council college, is under the direction of a president, a great steward, an aulic chancellor, a chancery, director, privy-aulic, and regency counsellors, &c. The revision-judicatory has a director, revision-counsellors, a secretary, and proctors. At this court a person may sue, within thirty days, for revision of the sentences of the aulic-judicatory, the offices of appeal, commission, and works. The other colleges are, the aulic-judicatory, whose sentences are notified in four general aulic-judicatory days, the aulic-chamber, the military conference, the chamber-office, and town judicatory at Mentz, the poor-house commission, and the office of works.

The electoral revenues are estimated at about one million two hundred thousand florins. The military forces consist of the elector's life-guard of horse, and a number of dragoons, with three regiments of foot, and the like number of provincial regiments, established on a regular footing. The city of Mentz being reckoned a barrier fortress of the empire, the circle of the Upper Rhine considers it as one of its fortresses, and frequently keeps in it, under certain restrictions, a number of troops belonging to the circle.

In the electorate of Mentz are forty-one cities and twenty-one boroughs.

S E C T. II.

A particular Description of Mentz, Cronberg, and Aschaffenburg, in that Electorate.

WE shall begin the description of the cities of this electorate with Mentz, or Mayence, called in Latin Moguntia and Moguntiacum, which is seated at the confluence of the Rhine and Maine, in the forty-ninth degree sixteen minutes north latitude, and in the eighth degree sixteen minutes east longitude from London. The city is pretty large and populous; but consists for the most part of narrow streets and old fashioned houses belonging to the burghers. In the year 1735 two Roman months were granted for the better fortifying of this city; but though the fortifications that were afterwards begun are excellent, they are still unfinished.

The archbishop's palace is built of a kind of red marble, in a very magnificent manner. It is only two stories high; but the apartments are very fine, the ceilings richly adorned, and the furniture very splendid. The ceiling of the hall where the elector dines, contains in different apartments the history of St. Martin, the patron of Mentz; and the tapestry with which it is hung represents the story of Æneas and queen Dido. At the end of this first apartment is a large and sumptuous cabinet of looking-glasses, enchased in little gilt squares; the bases are adorned with cartouches, upon which are painted fine landscapes, which are, amazingly multiplied by the reflection of these mirrors. From hence you have

a prospect of the Rhine, the Maine, and all the adjacent country, which is extremely delightful.

The second story has nothing remarkable, except the elector's bed-chamber, which is a very small one for a prince, but magnificently furnished. The tapestry is exquisitely fine, and represents in six pieces the whole fable of Perseus and Andromeda. The bed is of crimson brocade with a gold ground, and the canopy is covered with pearls. The chairs are carved, gilt, and covered with embroidered crimson velvet and gilt fringe; even the frame of the looking-glass, which is eight feet high; is covered with crimson velvet laced with gold.

The arsenal kept in the palace is no more than a large closet lined with fusils, muskets, carabines, and pistols; made by the most famous gunsmiths in Europe, and many of them are of exquisite workmanship. Here are also some air-guns. This palace, in the year 1750, received the addition of a beautiful new wing, and has the advantage of fine gardens.

The cathedral is a vast pile of reddish marble: immediately on entering it you see the sepulchral monuments of six antient archbishops of Mentz, whose statues stand leaning against the pillars that support the arched roof. On the other side are those of the two last electors; the statue of one of them stands in his episcopal robes, and is as large as the life: the tomb of the last elector is of black marble, and his statue, which is of white marble, is sitting: two little angels of white marble stand, one before him, presenting him an open book, which he seems to read; the other at his feet, playing with the archiepiscopal mitre. On each side of him is a cross of white marble, on one of which is an inscription. This work is esteemed here a finished piece; but there is nothing in it very extraordinary. In the choir are two other monuments, one of George Christian landgrave of Hesse, the other of a count of Lamberg, who was killed the same day that the marquis d'Uxelles, who defended Mentz against the allies, caused a parley to be beaten, and capitulated, which was on the ninth of September 1689. The statue of this count has something very particular, it being of white marble, and covered with armour, except a helmet and gantlets. He is in the attitude of one using all his efforts to get out of his coffin, which is of black marble, and pushes up the lid with one hand, while he supports himself with the other against the bottom of the coffin. The sculptor, besides making a man in a coffin with his armour on, has also ridiculously given him a full bottomed peruke, quite in buckle. The high altar of this cathedral is so contrived, that the priest faces the people, and need not turn about at mentioning the words *Dominus vobiscum*. The principal thing worth seeing here is the treasury, which is shewn for a ducat or two, by two officers nominated by the dean, and consists of jewels, rich vestments, and other church furniture, particularly an ostensorium valued at twenty-four thousand dollars.

The Augustine nuns of St. Agnes have a very elegant church, and the Carthusian monastery without the city is worth seeing, on account of the beauty of the church; in which are thirty-two stalls of a fine sort of wood, curiously inlaid with ivory. These seats were made by a Hamburger, and the monks value them at no less than a thousand dollars each.

There is a bridge of boats over the Rhine at Mentz, which is seven hundred and sixty-six paces in length, and leads to a little town on the other side, named Cassel.

The religious foundations here are, that of St. Alban's, the *ecclesiæ collegiatae insignes B. M. V. ad gradus*, with those of St. Peter, St. Stephen, St. Victor, the Holy Cross, St. Gangolph, St. John, and St. Maurice. It has an archiepiscopal seminary, dedicated to St. Boniface, with seven parish churches, and a Benedictine prelatrice, seated on Jacob's mount; as also a college of Jesuits, six monasteries and five nunneries; with a chartreuse, and two other nunneries near the city. There is also an university, and six hospitals.

About a mile from the city is the elector's palace, called la Favorita, which is a modern edifice, and is a most elegant and delightful place, both on account of its situation and prospect over the Rhine and Maine, the architecture, and the disposition of the garden, which

is adorned with pyramids, statues, cascades, and other water-works. The building designed for the orangery belongs to the main body of the palace, and the three pavilions on each side, serve for lodgings for the gentlemen of the court, officers and domestics, when the elector is here; but the apartments in which he resides, are void of all symmetry and elegance, and except one hall, have nothing to recommend them.

This city was besieged and taken by Gustavus Adolphus king of Sweden in 1631. Among the other booty which this prince found here, was a massy crucifix of gold, as large as the life. Frederic V. elector Palatine, and king of Bohemia, died here the year following of grief for the death of that prince, who was killed at the battle of Lutzen; being persuaded that had he lived a year longer, he would have reinstated him in his dominions. Prince Charles of Lorraine, with the electors of Saxony and Bavaria, laid siege to the city in 1689, and took it forty days after their opening the trenches.

Cronberg, or Kronberg, a small town seated on a mountain. About the year 1528, the Protestant doctrine was introduced here by the landgrave of Hesse, who then possessed the place; but in the year 1541, the landgrave ceding the town to the lords of Cronberg, they promised to leave religious worship in the state in which they found it. A part, however, of the inhabitants embraced the doctrines of the Romish religion, while the rest continued Protestants. After the peace of Westphalia the protestant religious worship was alone restored; but it afterwards falling to the elector of Mentz, the immunities which the Protestants alone enjoyed, were shared with the Roman catholics; and in 1738 the ancient citadel, which stood in the middle of the mountain, was in a great measure pulled down, and the stones belonging to it used for the new popish church. In this district are some fine woods, a variety of fruit, and a vast quantity of chesnuts.

Aschaffenburg, one of the best towns in the archbishopric, is seated on the Maine, in the fiftieth degree fifteen minutes north latitude, and in the ninth degree five minutes east longitude, and takes its name from the rivulet of Aschaff, which in its neighbourhood falls into the Maine. The citadel, in which the elector frequently resides during harvest, as long as the hunting season lasts, is grand and beautiful. It is a vast square building of red stone flanked by four large towers, with a platform in the middle; over the first gate is an equestrian statue of St. Martin, patron of the archbishopric of Mentz, and quite at the top the statue of Christ. On passing through the second gate you enter a spacious square court, surrounded with buildings three stories high. To the left is a portico of twelve columns, upon which rests a terrace railed breast high, and from hence you enter a chapel, the altar of which is of white marble, adorned with columns of jasper, and basso relievos, representing the history of our Saviour's passion, in several compartments, with a large crucifix of white marble at the top. On each side of the altar is a fine statue of the same marble, as large as the life; one of St. Martin cutting off a part of his cloak, in order to cover the nakedness of a poor beggar: the other of St. Wichard, archbishop of Mentz. The pulpit is also of white marble, and is adorned with statues of Jesus Christ, St. Peter, St. Paul, the four evangelists, and the four doctors of the church, St. Jerom, St. Ambrose, St. Gregory, and St. Augustine, all finely executed. In four niches of the pedestal supporting the pulpit are statues of Moses, David, Isaiah, and Daniel.

The apartments in the castle are spacious and richly furnished. In the great church dedicated to St. Peter are two altars adorned with excellent sculptures; one representing the crucifixion, and the other the adoration of the wise-men. The author of this piece, though well skilled in his profession, has given the king, who usually presents a large gold cup to the infant, nothing but a little box, into which the infant is going to put through a chink, a small piece of silver, which he holds between his finger and thumb.

In this town is also a college of Jesuits and a Capuchin cloister. The town is walled, and has a fine bridge of nine arches.

In the above castle, or palace, king George II. took up his quarters the night before the battle of Dettingen, in the year 1743, when being attacked the next day by the French, who crossed the Maine, they were repulsed, and the king continued his march to Hanau.

Aschaffenburg stands in a fine sporting country, about a league from the entrance of the Black Forest; and near it is a pleasant vale planted with vines and tobacco, besides some corn.

S E C T. III.

Of the other Territories subject to the Elector of Mentz, namely, the Eichsfeld, and the City of Erfurt, with the Country belonging to it.

THE Eichsfeld, frequently called Eisfeld, antiently belonged to Thuringia, and is environed by Hesse, Thuringia, and the principalities of Grubenhagen and Calenberg, it being in its greatest extent from north to south about thirty-six miles, and from east to west about twenty-four.

This country, agreeably to its natural situation, is divided into Upper and Lower Eichsfeld; both which are in a manner separated by the mountains of Duhn. The Lower Eichsfeld constitutes the northern part of the country, and is smaller than the Upper, but more level, warm, and fertile. It affords a sufficient quantity of corn, together with a good breed of cattle, and a great deal of flax and tobacco. The Upper Eichsfeld, which lies to the south, is for the most part mountainous, and has a cold, though wholesome air; but as it does not produce a sufficient quantity of corn, the inhabitants are supplied with what they want from Thuringia. This division is, however, very populous; and there are made here great quantities of serge and linen.

The high situation of this country is the reason that no river enters the Eichsfeld; though some run out of it, as the Leina, the Lutter, which on leaving this country soon falls into the Wesel, the Unstrut, the Wipper, and the Rume.

In the sixteenth century there were many Protestants in the Eichsfeld; but their number has gradually decreased, and the prevailing religion is the Popish. Such of the inhabitants as devote themselves to the study of the sciences, are instructed either at Heiligenstadt by the Jesuits, or at Duderstadt by the clergy; after which they visit foreign universities. In the Lower Eichsfeld the Lower Saxon language is spoken, and in the Upper the Thuringian.

The provincial states consist of the prelates, with the abbesses of the nunneries, whose places are filled by the provosts; of the nobility, and of the towns of Heiligenstadt, Duderstadt, Stadt-Worbis, and Treffurt. Their provincial diets are held in the open air, about four miles from Heiligenstadt; or, when the weather is very unfavourable, in the council-house at Heiligenstadt, in the presence of an electoral envoy and two commissioners.

The elector governs the Eichsfeld by a lieutenant, whose place is supplied by an administrator. At Heiligenstadt are the supreme temporal courts, namely, the provincial regency, which manages matters political, public, and criminal; the upper land-court, to which appeals lie from the prefectures of the noble and claustral courts, in both which the lieutenant, or his administrator, presides; together with the electoral provincial tax-office, and the electoral forest-office. In this country are also six claustral and fifteen noble judicatories.

Heiligenstadt, the capital of the country, is seated at the confluence of the Leina and the Geisled; it is the seat of the lieutenant and the supreme temporal judicatory, and contains in it a castle finely built of free-stone, where the regency and provincial judicatory hold their meetings; together with an electoral town-judicatory, a town-council, and a collegiate foundation dedicated to St. Martin. It has also a Jesuit's college, a school, and three churches. In 1739 this town was almost wholly destroyed by fire, but has been again rebuilt.

We now come to the city and territory of Erfurt. This city is situated in Thuringia, of which it is esteemed the capital, though it was never owned by the circle

of Upper Saxony as a state of that circle. It was founded in the beginning of the fifth century, and much dispute has arisen concerning the right of the elector of Mentz to that city; but those electors maintain, that from antient times they have had the sovereignty over it, and that they have granted the inhabitants all their immunities and privileges. However, in virtue of the stipulations between those electors and the house of Saxony, the protestant doctrine and worship has been agreed to be maintained in the state they were in when those stipulations were made; and this has been confirmed by the elector and chapter. Hence the greatest part of the inhabitants, both of the city of Erfurt and of the whole country, are Protestants.

The city of Erfurt is seated on the Gera, in the fiftieth degree forty-nine minutes north latitude, and in the eleventh degree fourteen minutes east longitude. It is large but not sufficiently populous, and is for the most part built in the old fashioned taste. It is fortified and defended by the citadels of Petersburg and Cyriacburg, and has a garrison of two battalions of imperial and electoral troops; and a number of noblemen reside in the town, on whom several privileges have been conferred by an ordinance published in 1755. It has a large cathedral, which is a secular foundation, consisting of a provost, a dean, six canons, and six vicars, which was founded as a cloister by St. Boniface in the year 752. The whole of this large structure rests on vaults, without any pillars to support the roof. The celebrated great bell in this church weighs two hundred and seventy-five centners, or thirty thousand two hundred and fifty pounds. The towers of this church have been demolished by fire. Here is also a collegiate church dedicated to St. Severus, which has six canons and four vicars. Here are likewise a college of Jesuits, and a rich monastery of Benedictines, under the direction of a mitred abbot; with seven other cloisters, four popish churches, and three chapels. The Lutherans perform their worship in six churches, and have five others which they make no use of. They have also a seminary in a building which was formerly an Augustine cloister. Here is likewise a celebrated university, which has five colleges. The theological faculty is entirely Roman catholic, but the senior of the Lutheran clergy is professor of the Augsburg confession, and receives a yearly salary of two hundred rix-dollars from the elector. The other faculties are filled up equally with the Lutheran and popish professors. To this university belong a botanical garden, an anatomical theatre, an astronomical observatory, and a riding academy. In the year 1754 an academy of the useful sciences was also founded at Erfurt.

The territory belonging to the city is for the most part fertile, and abounds with corn-fields and vineyards; but wood is scarce. This territory includes in it two towns and seventy-three villages.

SECT. IV.

Of the Electorate of TRIERS, or TREVES.

Its Situation, Extent, Produce, and Rivers. Of the Archbishop, his Election, Titles, Arms, and Power: the Offices by which the Government is administered; his Revenues and Forces; with a Description of the Cities of Treves and Coblentz.

TRIERS, or Treves, is bounded on the west by the dutchy of Luxemburg, on the south by the dutchy of Lorrain, on the east by certain territories which belong to the elector Palatine in the circle of the Upper Rhine, and on the north by the archbishopric of Cologne; extending in length about ninety-five miles, but its breadth is very different.

The country is pretty mountainous and woody, yet contains good pastures for cattle, and in many places fruitful arable land; but does not produce corn sufficient for the inhabitants: however, the growth of wine on the Moselle is very considerable. The country also abounds with game, and has mines of silver, tin, copper, lead, iron, calamy, and coal.

The Moselle is the principal river of this country, where it receives the Saar and the Kyll, after which it runs through the greatest part of the country of Triers, with several windings, particularly between the mountains, and at length, having received the Lahn, falls into the Rhine.

The people of this archbishopric are of the Romish church, and the whole of the archiepiscopal jurisdiction is divided into five archidiaconates, to which belong twenty decanates or provincial deaneries.

The archbishop of Treves is elected by the chapter, and swears to a capitulation, which the canons of that chapter propose to him; and the pope confirms such election in the usual manner, empowering one of the new elected bishops, allotted for that purpose, to consecrate him.

The archiepiscopal titles are, By the grace of God archbishop of Treves, of the holy Roman empire throughout Gaul and the kingdom of Arles arch-chancellor and elector, and also administrator of Prum.

The arms of the archbishop are, on account of Treves, a shield quartered, bearing in the upper dexter field and also in the lower field sinister a cross gules in a field argent; and, on account of Prum, in the upper field sinister and the lower field dexter, a lamb argent, bearing a small trophy, on which is depicted a cross on a mount verte in a field gules.

This archbishop is in rank the second spiritual elector. At the election of an emperor he delivers the formula of the election-oath to the elector of Mentz, to be sworn to by him; and he has the first voice at the election of the emperor. As elector he enjoys both a seat and voice in the electoral council at the diets of the empire, and, as archbishop of Treves, obtains the second place in the electoral Rhenish circle. The suffragans of this archbishop are the bishops of Metz, Tull, and Verdun.

The chapter of Treves consists of forty canons, among whom are sixteen capitulars, and twenty-four domicelli. All these canons must, at least, be descended from antient noble families, and have it in their power to exhibit sixteen ancestors capable of being admitted to tournaments. The regency of this country consists of a chancellor, a privy and regency counsellors. The court of revision consists of a director, four revision counsellors, and one actuary: before this court processes are brought from both the aulic judicatories, one of which is at Treves in the upper archbishopric, and the other at Coblentz; and to these aulic-courts appeals lie from the several courts in the towns and prefecturates.

The revenues of the elector are said to amount annually to about seventy thousand pounds sterling. The taxes raised are agreed to at the land diets by the land states. In the year 1714 these states mutually agreed in what manner and proportion the aids to be granted yearly to the sovereign should be levied from each state: namely, that there should be annually paid by each married couple one Rhenish florin; but by widowed persons only half a florin: and that a certain sum should be annually paid by persons of every occupation; as for instance, by haberdashers, manufacturers, innkeepers, &c.

The archbishop has regular forces and a militia: the former generally consist of the circle troops, which the elector of Treves is bound to maintain, and which amount to between eleven and twelve hundred men. The elector has also a life-guard of forty persons.

The principal places in this electorate are the following:

Treves, or Triers, the capital of the upper archbishopric, is seated between two mountains on the river Moselle, over which it has a costly stone bridge. This city is situated in the forty-ninth degree fifty-eight minutes north latitude, and in the sixth degree ten minutes east longitude, and is so antient, that it was inhabited by the Treveri long before the birth of Christ. The antient Roman emperors afterwards resided here; and in the days of Constantine the Great, it was the capital of all Gaul. Here are some remains of an antient Roman theatre. The archiepiscopal court or palace was rebuilt by the elector Francis George, and stands near the cathedral

thedral church of St. Peter, which is seated on a hill, and is a large building. There are also three collegiate and five parish churches, with three colleges of Jesuits, and thirteen monasteries and nunneries; a house of the Teutonic order, and a mansion belonging to the order of St. John. Here is also an university.

Coblentz, in Latin Confluentia, the capital of the lower archbishopric, is seated near the influx of the Moselle into the Rhine, in latitude fifty-six degrees thirty-nine minutes, and in longitude seven degrees twenty-three minutes. Here was a citadel in the time of the Romans, and the kings of the Franks kept their court here. The Rhine on the one side, and the Moselle on the other, render the spot on which the city stands a sort of peninsula, and serve it for ditches. Over the latter is a stone-bridge of fourteen arches; but it is so narrow, that two coaches can hardly go a-breast. At its extremities are double gates, towers, and port-cullises, with some pieces of cannon to command the passage. The fortifications of the city consist of strong bastions, provided with cavaliers, ravelins, half-moons, large and deep ditches, a good counterscarp and covered way, all well paved, palisadoed, and mounted with brass guns. The Moselle is very rapid, as well as the Rhine, and when the two rivers meet, you may easily distinguish the water of the one from the other; that of the Rhine being yellowish, and the Moselle so clear, that you may distinctly see the bottom; but what is surprising is, that they have such scarcity of fish in this place, that there is hardly enough for the elector's table on fast days.

Besides the principal church, here are two collegiate churches, an episcopal seminary, a college of Jesuits, and a seminary, with seven monasteries and nunneries.

The citadel, which is named Ehrenbreitstein, is an important fortress, seated on a mountain opposite to Coblentz; the ascent to which is pretty difficult, it being by a winding road cut out of the rock. There are three gates to be passed before you can enter the citadel, and upon the outermost is a statue of brass representing the Virgin Mary with the infant Jesus in her arms, and holding a lily in her hand: this figure is about fifteen feet high. On passing through this gate, you come to a square, on one side of which is the governor's house, and the magazines and barracks occupy the three others. Here among other curiosities is a cannon of a prodigious magnitude, it being eighteen feet and a half long, its bore a foot and a half in diameter, and its breech three feet four inches: it carries a ball of one hundred and eighty pounds weight, and consequently its charge is ninety-four pounds of powder. From this square you proceed to another, in which is a fine fountain. In the middle of a large stone basin stands a marble pillar upon a brass pedestal, adorned with the elector's arms, and surrounded with four dolphins of the same metal. On the top of this column is a statue of the Virgin Mary bruising the serpent, which is also of brass, about twelve feet in height. The well of this fortress is said to be five hundred and fifty feet deep, and to have cost great sums, they being obliged to dig it out of the solid rock.

The fortifications of this citadel are good; but irregular, from the inequality of the rocks on which they are built, and indeed it may be esteemed impregnable; for in it is all that art can add to nature. The gate is covered by a vast horn-work, with a ditch before it, beyond which is a large half moon. There is no advanced work, or sally port, but what is flanked. On the side toward the river, there are lines of communication to the right and left, worked through the steepest parts of the mountain; and where the situation would admit of it, they have built well-faced redoubts, which render the access to it very difficult. The fort below is on a straight line, and consists of three bastions, with their curtains commanding the river.

From this citadel is the most delightful prospect in all Germany. First, one sees at the foot of the mountain the elector's palace, which stands on the brink of the Rhine, this river and the Moselle, with the whole city of Coblentz from one end to the other built upon a neck of land at the confluence of these two rivers. You see in the middle of the Rhine two little islands, one about

half a league above the town, shaped like a heart, about a quarter of a league long, and in it is a very fine convent of Benedictines: the other, about a league below the town, is twice as long as the former, and upon it stands a pretty considerable village, and a convent of Bernardines: the chartreuse, seated on a rising ground, adds greatly to the beauty of the prospect; and the farther part of the landscape presents a pleasing variety of little hills, vineyards, plains, valleys, villages, castles, convents, and pleasure-houses. In short, this fortress commands all the adjacent country, and is justly reckoned one of the strongest places in Germany, and called the key of the Rhine and Moselle.

The apartments of the elector's palace are not very large; but they are adorned with beautiful tapestries. There is, however, a hall above one hundred feet in length, on the ceiling of which are painted in several compartments, several events in the history of Marcus Aurelius and Ælius Verus. It is also adorned with many good portraits: among others are those of the emperor Leopold, and Charles VI. with Frederic the Great, elector of Brandenburg. Among the principal tapestry hangings, are the history of Joseph and his brethren, in twelve pieces: that of Belshazzar, in eight pieces; but the finest of all represents the story of Meleager and Atalanta, in six large pieces. His highness's chamber is hung with red damask, the bed and arm-chairs are of the same, and the whole adorned with gold fringe.

The chapel is small, but very elegant, and beautified with paintings in separate compartments, representing the most remarkable passages in our Saviour's life, some of them by Baptista, an Italian master, and the rest by Hector, a famous German painter. The ceiling is adorned with gilt sculptures.

The garden is of no great extent, there being but little earth between the rock and the Rhine; it is, however, embellished with statues, fountains, and a fine orangery. A large harbour which extends along the river, is one of its most considerable ornaments, it being above three hundred feet in length; and from the openings of this bower you see the Rhine, the Moselle, the town of Coblentz, the bridge across the Moselle, the chartreuse, and a very fine country to the distance of three or four leagues.

The chartreuse is delightfully situated, about the distance of three quarters of a league from the town: in the way to it you continually meet with chapels in the manner of oratories, adorned with statues representing the principal actions of Jesus Christ from his birth to his resurrection.

SECT. V.

Of the Electorate of COLOGNE.

Its Situation, Extent, and Produce. The Prerogatives, Titles, Arms, Revenues, and Forces of the Elector; with a particular Description of the Imperial City of Cologne, and the other remarkable Places in that Electorate.

COLOGNE, the last of the three spiritual electorates we have to mention, extends along the western bank of the Rhine, between the duchy of Cleves on the north, the electorate of Treves on the south, the duchy of Juliers and the Netherlands on the west, and the duchy of Berg, from which it is separated by the Rhine, on the east, extending above ninety miles in length, but hardly any where above seven or eight in breadth. The archiepiscopal countries, however, do not lie together; but many of them are separated by other countries. The longest connected part is that just mentioned; but another portion of it lies chiefly between the duchy of Juliers and the archbishopric of Treves; and another is in Westphalia, and terminates to the east on the bishopric of Paderborn, Waldec, and Hesse; to the south on the counties of Wittenstein and Nassau, and on the duchy of Berg; to the west on the same, and the county of Mark; to the north on the bishopric of Munster and the county of Lippe; extending from north to south forty-seven miles, and from east to west thirty-eight.

The countries subject to the archbishopric are of a very different nature and goodness: one part of them is very mountainous and woody, another sandy, and another fruitful. The woody tracts afford much game, the country situated on the Rhine abounds with vineyards, and the rivers with fish.

In this archbishopric none but those of the Romish church enjoy the public exercise of their religion; but, notwithstanding this, there are many Protestants in it.

This country was a bishopric in the year 314, and was made an archbishopric in the eighth century. The archbishops early obtained the honour of the *pallium*, and that of bearing the cross, and in the tenth century they were deemed equal to the archbishops of Mentz and Triers, and they still bear the title of arch-chancellor throughout all Italy, though they have no opportunity of exercising their office. Besides the prerogatives which this prelate enjoys in common with all the other electors, he is possessed of some peculiar to himself. Thus, at the election of the king of the Romans, and of the emperor, he has the next voice after the elector of Treves; and sits at public assemblies, when held within his ecclesiastical jurisdiction, or out of it in Italy and Gaul, at the emperor's right hand; and both he and the elector of Treves, share the honour of precedence alternately.

The constant title of the elector of Cologne runs thus, By the grace of God, archbishop of Cologne, and arch-chancellor of the holy Roman empire throughout all Italy, as also elector and *legatus natus* of the holy apostolic see, duke of Engern and Westphalia, &c.

His arms on account of the archbishopric of Cologne are, a cross sable in a field argent; for the dutchy of Westphalia, a white horse saliant in a field gules; for the dutchy of Engern three hearts or, in a field gules; and for the county of Arensberg, an eagle argent in a field azure.

The chapter has its residence at the archiepiscopal cathedral in the imperial city of Cologne, and consists of twenty-five canons, and a number of domicelli.

The elector of Cologne has the following offices, the privy-conference, the aulic council, or regency-college, and the aulic judicatory.

The electoral revenues arising from the archiepiscopal countries, according to Mr. Busching, are not very considerable; but others say, that in time of peace those of Cologne amount to one hundred and thirty thousand pounds sterling per annum, and that of his other territories to nearly as much more; but he cannot commence a war without the consent of the chapter, who may convene the states in order to oppose him. The elector maintains a life-guard of halberdiers and yeomen, together with a regiment of foot guards.

The land-states here consist of the prelates, nobility, and towns; and the land-diets in the proper archbishopric are usually held at Bonne.

In the archiepiscopal countries are fifty-two towns and above seventeen boroughs, the principal places in which are the following:

Bonne, a small, but well inhabited city, in which the elector resides, is situated on the west side of the Rhine, in the fiftieth degree thirty-five minutes north latitude, and in the seventh degree five minutes east longitude, twelve miles to the southward of Cologne. It stands in a fruitful country that produces good wine, and the woods with a ridge of mountains abound with game. The fine palace in this city was begun in the year 1718. Besides the principal church, which is a stately building, there is a collegiate and parish church. The Jesuits have likewise a college, and several orders have their convents. In the years 1673, 1689, and 1703, this city was besieged and taken by the Imperialists and their allies: in the last mentioned year it was taken by the duke of Marlborough, and upon its restitution by the treaty of Utrecht, its fortifications were to be demolished.

The imperial city of Cologne, by the Germans called Keulen, in Latin Colonia Agrippina, is one of the oldest and largest cities of Germany, and is seated on the Rhine, in the fiftieth degree fifty minutes north latitude, and in the sixth degree forty-five minutes east lon-

gitude. It was originally built by the Ubii, who were taken into the protection of the Romans, and removed to the west of the Rhine, where they founded a town, to which, by order of the empress Agrippina, consort to Claudius, who was born there, a Roman colony was sent; whence arose the name of Colonia Agrippina, from the first word of which the appellation of Cologne received its origin. It was the chief town of Germania Secunda, and continued under the power of the Romans till the Franks put an end to their dominion in the fifth century. At present it is the residence of the chapter of the archbishopric of Cologne, as also of a pope's nuncio.

This city affords a very agreeable prospect at a distance, and being situated in a plain and level country, the vast number of its steeples make a fine appearance. It is built in the form of a half moon, and has one strong wall on the side next the Rhine, with out-works, half-moons, and ravelins; the walls of the city have also eighty-three towers, and three deep ditches round them; they are planted with rows of fine trees, and the roofs of the houses are slated. A flying bridge extends over the Rhine to the town of Duits, which is on the opposite side of the river. This flying bridge, as it is called, is well contrived; it is built on large flat boats, so well belayed with ropes and iron chains, that it is impossible they can be loosened, and there are five or six boats of a smaller size, that lie at anchor in a straight line, in the middle of the river, at equal distances from each other, and two musket-shot above the bridge. To these boats are fastened two strong cables, the ends of which pass through pulleys fixed at the top of posts within the bridge, and make it when loosened tack and veer merely by the current of the water, without any need of rowing, or any other working, except steering. It is said that the continual passage by this bridge brings into the chapter of the cathedral a revenue of above ten thousand crowns a year.

Among the buildings of this city, the cathedral of St. Peter deserves particular notice, and it would be very magnificent were it quite finished; for a part of it is extremely fine. The steeple is two hundred and fifty feet high, and affords a fine view of the city. The choir is said to be the highest in Germany, and the chancel is supported by four rows of large pillars. Upon the principal altar in the choir, lies in a silver coffin the corpse of St. Englebert, archbishop of Cologne, who suffered martyrdom under Dioclesian and Maximian. His statue of white marble, in his pontificals, lies upon a table of black marble, leaning his head upon his hand, and at his feet stand two angels of white marble, the one holding a crown, the other a branch of palm gilt. There are several other antient tombs; but the most celebrated of them all are those of the three kings, or eastern magi, who came to offer presents to the infant Jesus; for it is pretended that their remains were removed hither from Milan in the year 1162, when Frederic Barbarossa laid waste that city. These bodies are deposited in a large purple shrine spotted with gold, upon a pedestal of brass, in the midst of a square mausoleum of marble. This mausoleum is in a small chapel behind the choir, and the shrine is opened every morning at nine o'clock, when these kings are shewn lying at full length; but two of the canons must always be present. They here report abundance of miracles wrought by them, and among the rest, that there being a great drought in Hungary, many people came from thence to implore the assistance of these three magi, who are said to have promised them rain, which falling soon after in great plenty, a body of the Hungarians, in remembrance of this miracle, come every seven years in pilgrimage to Cologne, where they are entertained by the magistrates for a fortnight in a handsome house built for that purpose. The heads of these pretended kings have each a crown of gold adorned with precious stones of various kinds, and their names Gaspar, Melchior, and Balthazar, are in purple characters upon a little grate before the shrine; which is immensely rich, it being adorned with an infinite number of large and valuable pearls, besides other precious stones of all colours, among which is an oriental topaz, as big as a pigeon's egg. A little above the shrine hang two large golden cups, and

a man on horseback of the same metal, votive pieces offered to the three kings. Opposite to them are six large silver branches, with tapers of virgin wax, which burn day and night. Under a vermillion grate before the shrine are two Latin verses cut on marble, that "here three bodies of the magi lie entire, and no part of them any where else." At the top of the front of the mausoleum the history of their adoration is represented in basso relievo upon white marble; over the sculpture is a large star gilt, and in another part of the mausoleum are six Latin lines, alluding to their three offerings, and the three devotional uses to be made of them; namely tears, a pure heart, and prayers offered to Christ from an humble soul. Upon the back of the mausoleum is represented in basso relievo, upon white marble, the history of the translation of the three magi from Milan to Cologne, with the procession made on that occasion.

In the church of St. Ursula are shewn the tombs of the eleven thousand virgins massacred by the Huns at Cologne. This idle story has been fully refuted by archbishop Usher, and even by learned men of the church of Rome, who all agree, that it is founded on a mistake with relation to the antient manner of setting down the names and titles of the saints. The above learned protestant divine supposes that St. Ursula's companion was named Undecimilla, and that her name was mistaken for Undecim millia, or eleven thousand, a conjecture which is supported by an antient Missal in the Sorbonne, where the feast of St. Ursula, patroness of the Sorbonne, is thus expressed, *Festum S. S. Ursula Undecimillæ & sociarum Virginum & Martyrum*.

But to return, it is pretended that the earth is here rendered so holy by these virgins, that it will not receive any other corpse; as a confirmation of which they shew the tomb of the daughter of a certain duke of Brabant, who, on their going to bury her, they say, raised herself up, and remained suspended in the air; this obliged them to put her into this tomb, which is fixed upon iron supporters two or three feet from the ground, against one of the pillars of the church. In a large chapel on one side of the same church are to be seen the bones of those eleven thousand legendary saints; the walls are adorned with rows of busts gilt, in which they pretend the heads of many of these virgins are preserved; and some of them have cases of cloth of gold, velvets, and rich silks. Besides, their bones are hung up in as decent a manner as the swords and pistols are ranged in an armoury; and among these some appear to have belonged to children five or six years old: but a celebrated physician of this place was treated as a heretic for saying there were among them two or three bones of large mastiff-dogs, and boasting he could incontestibly prove it; for which he was condemned to pay a considerable fine, and banished the diocese of Cologne. The church is full of the tombs erected for these virgins: that of St. Ursula is of black and white marble, about two palms long and six in breadth; her statue of white marble lies at full length crowned with a garland of flowers, and at her feet is a dove. The revenue of this church, which must be very considerable from the offerings made by pilgrims, and other devout persons, belongs entirely to an abbess and six canonesse, who, to do honour to St. Ursula, must be all countesses.

The collegiate church of St. Gerion has ten canons, and a great number of chaplains, all of whom enjoy a very handsome revenue. The choir of this church is covered with tapestry, and with nine hundred heads of Moorish cavaliers, the companions of Gregory, an Ethiopian prince. These were all Christians, and going to the emperor Constantine's army, when they were taken and slain. They are ranged in little niches, between every two of which is a gilt foliage of carved work; and a cap of scarlet, adorned with pearls, upon every head. In a corner of this church is shewn one of the pillars of the scaffold on which all these holy martyrs were beheaded; and this pillar of a scaffold is of fine jasper spotted with blood, and about a foot in diameter.

The church belonging to the Jesuits-college is a very lofty and elegant building, and against the pillars which support the ceiling are statues of the twelve apostles, and of many other saints, as large as the life. The pulpit de-

serves attention on account of the sculptures with which it is adorned. Before the principal altar hangs a silver lamp of exquisite workmanship, six feet in height: the figures of Christ, with the five wise and five foolish virgins in the parable, are represented in relievo with great delicacy. This church has few good pictures; but its wealth is immense; one altar is upon occasion entirely covered with a kind of embroidery with gold wire and pearls; another is enriched with a vast number of rubies, some of them very large; another is of massy silver, and contains in basso relievo the history of the assumption of the holy Virgin, with St. Ignatius upon one side, and St. Francis Xavier on the other. There is also one of massy silver, with a border of gold embellished with pearls; another of gold brocade, with pearls and emeralds, among which are many of great value; another of crimson embroidered with gold, and decorated with carved figures of Jesus Christ, St. Joseph, the Virgin, Ignatius, and Xavier. The last is of exquisite workmanship, and of a very extraordinary magnitude; these ornaments being only used to adorn the great altar on certain solemn festivals, and are therefore kept in the vestry, where is an innumerable quantity of branches, candlesticks, lustres, busts, vases, as well as rich chalices, pattens, cups, plates, and other utensils for mass; and all the latter are of gold enriched with precious stones.

The refectory belonging to this college is very large and well wainscotted, the ceiling is adorned with sculpture, and is hung all round with pictures representing the principal events of our Saviour's life.

The church of the Maccabees has on the outside of the gate a picture representing Salomone, the mother of those martyrs, trampling Antiochus Epiphanes under her feet. She holds her seven sons crowned with laurel under her gown, four on one side and three on the other. Their history is painted on the wall in the corner of the church, in eight different pieces. The heads of the Maccabees are kept in the tabernacle of the principal altar, which is of purple embroidered with gold; and each of these heads has a crown richly adorned with pearls, rubies, and emeralds. They likewise shew here the pretended head of St. Joachim, the father of the Virgin Mary, and that of St. Anne her mother, with numberless other relics. The history of the martyrdom of the eleven thousand virgins is also painted on several parts of the walls, and near the church is a well into which they pretend their blood was poured. The Benedictines, to whom this church belongs, pretend, contrary to a tradition among the Ursulines, that the princess Ursula was massacred on the spot where the principal altar stands.

The church of St. Pantaleon is adorned with pictures of the history of that saint, who was a physician in Nicomedia, and is represented in eighteen pieces. The emperor Galerius Armentarius ordered him to be put to a variety of torments, on account of his adherence to his religion. In the tenth piece he is plunged into a cauldron of melted lead, which one would have thought would have burnt him to the very bone; but the legend says he came out unhurt. In the two last paintings he is precipitated from a high rock into the sea, with a millstone tied about his neck; but he does not sink. After all this they were obliged to cut off his head, which was no sooner done than they pretend there sprung out two fountains, the one of blood and the other of milk. They also shew here a gold box, which they say contains the ashes of St. Pantaleon, his body having been burnt at Nicomedia. In this church is also the history of St. Alban, in twelve capital paintings; and behind the great altar they pretend to shew his bones deposited in a fine silver shrine.

The entrance of the church of the Apostles is particularly remarkable for the story it represents, which is that of a burgomaster's wife of this city, who being buried here in 1571, with a valuable ring on her finger, the sexton, resolving to steal the ring, paid a visit to the grave; but was so extremely frightened when he found the supposed deceased lady grasp him by the hand, that he made a precipitate retreat. The lady, however, rose from her tomb, and returning home, knocked at the door, and calling to a servant, told him the whole adventure; but the fellow, taking her for a ghost, ran in a great fright to his

his master, and informed him of what had happened; when the gentleman immediately cried, that he would as soon believe his horses were in the garret. These words were no sooner uttered, but a great noise being heard in the garret, the servant ran up, and to his great amazement found six coach-horses there. By this time the lady had made a shift to get in, and by the care of her servants was soon so well recovered, that there was no great appearance of her returning to the grave for that time, and the next day the horses were let down out of the garret by certain machines prepared for that purpose. Absurd as this story is, it is here firmly believed, and to this day there are shewn in the same garret several wooden horses, said to be covered with the skins of those that were seen there; and in the church of the twelve Apostles is a large piece of linen cloth spun by the lady after her being released from the grave, which she survived seven years. We find some authentic testimonies of the truth of this memorable story; but in these no notice is taken of the horses, as being an evident, and very ridiculous fiction, invented to heighten the wonder.

The town-house is a vast Gothic structure, which those who shew it say was built after the model of the antient capitol at Rome. In the front is a basso relievo representing a man fighting a lion; and in the great hall are five pictures, with several Latin inscriptions in verse on each, to perpetuate the memory of the celebrated battle of Hochster, gained by the bravery and conduct of the duke of Marlborough and prince Eugene over the French and Bavarians; with elegiums both on queen Anne, those generals, and the English and Dutch. The entrance of the chamber where the city-council meet is a vestibule of inlaid work, after the antique taste, and on each side is a Latin distich, advising the counsellors to leave all partiality behind them, and declare their judgment freely, and, at their going out, to observe fidelity in execution, and a prudent taciturnity. Upon the inside of the chamber-door are six verses, intimating the duties which belong to the office of a ruler. In this apartment is a picture of the last judgment, sixteen feet in breadth, and eight in height. On the chimney-piece is a very fine crucifixion by Van Dyke; on one side of it is the portrait of the emperor Leopold, and on the other that of the empress his consort. In this structure are several rooms, in which are deposited a vast number of bows, arrows, cross-bows, bucklers, and other antique arms. One of these cross-bows is of whalebone, and is said to be twelve feet long, eight inches broad, and four inches thick. From the tower of this building is a very fine prospect of the whole city and the adjacent country.

In short, there are in this city ten collegiate and nineteen parish churches, with four abbeys, seventeen monasteries, thirty-nine nunneries, sixteen hospitals, and about fifty chapels. The numerous protestants who dwell in the city resort to Mulheim, where they publicly perform their religious worship. The Jews live chiefly at Duits, a mean borough entirely dependent on the elector; its houses are of wood plaistered with white clay, and its few streets extremely filthy and ill paved. In the town, says our author, one sees more swine than men, three fourths and upwards of the inhabitants being Jews, who, for the sake of profit, fatten whole herds of those animals, which their law forbids them to eat, in order to sell them at a high price to the Christians. The Jews are indeed not permitted to lie one night at Cologne, nor so much as to enter the city about their affairs, without paying a gold florin for every hour they stay, and being escorted by one of the town guards, whom they are obliged to pay for his trouble. This is done as a punishment, their ancestors having, it is said, intended to kill the inhabitants by poisoning the wells and fountains. This, however, serves for a pretence, which the magistrates probably make use of to prevent the Jews undermining them in their trade.

Cologne is one of the Hanse towns, and pretends to have preserved its liberty without interruption for many centuries; but the calamities of war have often occasioned great disorders in its government and commerce. The Dutch make use of it as a magazine for their trade upon the Rhine, and this has engaged that state to defend Cologne on all occasions against the pretensions of

the elector. Cologne is governed by the chapter and magistrates, the latter consisting of two burgomasters and forty-nine counsellors. The elector has also some power, and nominates a magistrate who is judge in criminal causes; and the city swears allegiance and homage to the new elector, so long as he continues to protect them in their just rights and privileges, and confirms their immunities. As a free imperial city, it has a seat and voice at the diets of the circle of Westphalia, and at those of the empire in the college of the imperial cities, and enjoys the first place on the Rhenish bench. Cologne maintains four companies of soldiers, but in time of war the emperor, or an ally, usually places a garrison in the city.

Near Renfe, a small town seated on the Rhine, is to be seen a remarkable piece of antiquity, called the Konigstuhl, or Regal throne, consisting of a round vault built of free-stone, resting upon nine stone pillars, one of which stands in the middle. This vault is eight German ells and a quarter high, above forty in compass, twelve and a quarter in diameter, and furnished with seven seats, agreeable to the antient number of electors. The ascent to it is by twenty-eight stone steps, and it has two strong doors. In this place the electors formerly held previous consultations on the election of a king and emperor, and whenever the election, on account of any impediments, could not be performed at Franckfort, it was done here; the electors here also consulted on the weighty affairs of the empire, and here the emperors confirmed their privileges. At this place was established the electoral league concluded in 1338. It was particularly chosen by the electors, because the four electors of the Rhine have places belonging to each of them lying near it; the elector of Cologne being possessed of Renfe, the elector of Mentz of Upper Lahnstein, the elector of Treves of Capelle, and the elector Palatine of Brauhach.

SECT. VI.

Of the PALATINATE OF THE RHINE.

Its Situation, Extent, Produce, and Rivers. The Revolutions the Palatinate has undergone with respect to Religion. The Titles and Arms of the Elector; the public Offices of the Government, with the Elector's Revenues and Forces, and a Description of the Cities of Mannheim and Heidelberg.

THE country of the elector Palatine, also called the Palatinate of the Rhine, and the Lower Palatinate, to distinguish it from the Upper Palatinate, in the circle of Bavaria, is bounded on the east by the archbishopric of Mentz, the bishopric of Worms, and a part of the territory of the Teutonic order in Franconia; to the south by the dutchy of Wurtemberg and the bishopric of Spire; on the west by Alsace, the dutchy of Deuxponts, and certain districts belonging to the elector of Mentz; and on the north by a part of that archbishopric and Triers; extending about a hundred miles in length, and seventy in breadth.

This country is indeed partly mountainous, but yet uncommonly fertile, producing in abundance all sorts of corn, pulse, fruit, chesnuts, and walnuts; with fine pastures, and a good breed of cattle; together with plantations of tobacco, and vineyards which produce Neckar and Rhenish wine. The Bergstrasse is an agreeable highway between Heidelberg and Darmstadt, which is planted with walnut-trees, and on both sides has fruitful fields and meadows, intermixed with hills and mountains, which on the right side of the road, in travelling from Heidelberg to Darmstadt, extends to a considerable length, and are covered on their summits with woods; but towards the plain with vineyards. The numerous walnut-trees on the Bergstrasse and the Odenwalde, as well on account of their fruit as wood, are of great advantage to the country. On all parts of the Bergstrasse grow almonds in great plenty, and in the vineyards are chesnut-trees.

With respect to the rivers of this country, the Rhine runs partly through its borders, and partly through its center. Near Germerheim and Selz, out of the sands

of this river is washed the best Rhenish gold, to which the Rhenish gold florins owe their original. The gold thus washed is looked upon by the elector as a royalty, and accordingly farmed out by him. There are several rivers which here fall into the Rhine, particularly the Neckar and the Nahe. These rivers, as well as the smaller ones, abound in fish.

The state of religion has been here subject to alterations unheard of in other nations. The people were prepared for the reformation when, in the year 1518, Luther held his disputation with much approbation in an assembly of Augustine monks at Hiedelberg, and the pacific measures of the elector Lewis contributed to promote it. The reformation was carried on by his brother and successor Frederic II. but under Frederic III. some French and Swiss divines coming into the palatinate, a warm dispute arose between the Protestants concerning the Lord's Supper, which gave occasion to the electors joining the Calvinists in 1560, and he was the first German prince who introduced the religion of Calvin into his country. But, notwithstanding the zeal he shewed for the doctrine of the Calvinists, Lewis VI. his son and successor, with equal zeal brought in again Lutheranism, dismissed the Calvinist preachers, and appointed Lutherans in their stead. After his death John Casimir, guardian to his son Frederic IV. reversed all he had done, and with such zeal introduced the Calvinist doctrines, that only a few churches remained to the Lutherans; and in the following reigns Calvinism still more prevailed: the popish doctrines and worship were afterwards introduced in several places, and the Protestants oppressed by the Bavarian troops, till affairs were settled by the peace of Westphalia. At length the Calvinist line of princes becoming extinct, and the succession falling to the Roman catholic line of Neuburg, the popish doctrines and worship were gradually more and more introduced, and the Protestants deprived of the power they had hitherto enjoyed. The French afterwards ravaged the Palatinate, and oppressed the Protestants.

In the year 1705 the elector John William tolerated the three religions, and declared that they should enjoy full liberty of conscience; and, in particular, that the Calvinists and the Lutherans should be permitted the public and private exercise of their religion, together with the spiritual jurisdiction. To the Lutherans were confirmed their peculiar consistory, erected in 1698, independent of the Calvinist church-council. To their use alone were left all the churches, which belonged to them in the year 1624, as also those which since that time had been built or should be built by them for the future; and that they should likewise have whatever they could prove belonged to them in spiritualities, schools, rents, and incomes in 1624. To the Calvinists all churches and schools were confirmed in the manner they enjoyed them in 1685; except only that in the towns where they had two or more churches, and the Roman catholics none, they were to give up one of them to the latter: in such towns where there was only one church they were to give up to them the choir, and two out of every seven country churches, and also two-sevenths out of their revenues. The estates and incomes arising from the suppressed foundations, provostships, cloisters, &c. were to be administered by a spiritual administration, consisting of two popish and the like number of Calvinist counsellors, with other necessary officers. Something certain was also settled with respect to the popish holidays, mixed marriages, and other affairs which till then had been subjects of dispute. But, notwithstanding this agreement, and the small number of the Papists, alterations have been continually made, and the grievances of the Protestants greatly increased. To the disgrace of the Reformation the two Protestant churches have themselves been for a long time the zealous enemies of each other, to their mutual detriment, and the no less advantage of the Roman catholics. The Lutherans, according to their own computation, amount to about fifty thousand, and are possessed of eighty-five parishes; but one-half of their preachers and school-masters still want a competent maintenance. The number of Calvinist clergy is estimated at five hundred, and those of the Roman catholic at four hundred.

The titles of the elector are as follow: Palgrave of the Rhine; arch-treasurer and elector of the holy Roman empire; duke in Bavaria, Juliers, Cleves, and the Berg; prince of Mors; marquiss of Bergen-op-Zoom; count of Veldens, Sponheim, the Mark, and Ravensberg; and lord of Ravenstein.

The arms on account of the Palatinate on the Rhine are, a lion or, in a field sable: on account of Bavaria, lozenges or fusils: on account of Juliers, a lion sable, in a field or: on account of Cleves, eight regal sceptres conjoined in one small shield, in a field purple: on account of Berg, a lion gules, crowned verte, in a field argent: on account of Mors, a fesse sable, in a field or: on account of Bergen-op-Zoom, a shield damaskeened: on account of Veldenz, a lion verte, in a field argent: on account of the Mark, a fesse consisting of three chequers gules and argent, in a field or: on account of Ravensberg, three chevrons gules in a field argent; and on account of Ravenstein, a red deer's attire in a field argent.

The elector has an order of knighthood of St. Hubert, first founded in the fifteenth century; but revived by the elector John William in 1709. The badge of this order, is a quadrangular cross worn pendant at a red ribbon, and on the breast a star. The elector is supreme master of this order, and the knights consist of princes, counts, and barons.

The high colleges here are the privy state-conference, and the privy-chancery, the regency, the upper court of appeals, the aulic-jurisdiction, the aulic-chamber, and the war-council.

The annual revenues of the elector arising from the countries of the electoral and Upper Rhenish circle are estimated at nine hundred thousand guildens, exclusive of the large sums received from the administration of the spiritualities. The revenues of the duchies of Juliers and Berg, together with those of the signiory of Ravenstein, also amount annually to about the same sum, to which is to be added the revenue arising from the duchies of Neuburg and Sultzbach.

The elector maintains two regiments of horse-guards, and another of Swiss, with a body of horse and foot, amounting in the whole to about six thousand men.

The Palatinate contains forty-one towns, and several boroughs, the principal places in which are,

Manheim, the electoral residence, and the second town in the electorate, is a strong fortress seated in a low plain near the influx of the Neckar into the Rhine, in the forty-ninth degree thirty-six minutes north latitude, and in the seventh degree thirty-two minutes east longitude. In the year 1606, the elector Frederic IV. began to convert the old village and citadel of Manheim into a town, receiving into it some of the inhabitants of the Netherlands who had quitted their country, in order to enjoy liberty of conscience. And though it was dreadfully laid waste in 1622, when besieged and taken by the Bavarians, and in 1688, entirely demolished by the French, yet the electors John William and Charles Philip caused it to be rebuilt and fortified in such a manner, that it is now become one of the finest towns in Germany, and a place of great strength; but requires ten thousand men to defend it.

It has three fine gates, of which that of the Neckar is the most magnificent, and best adorned, it having basso relievos very beautifully executed. This gate opens into a long and spacious street, at the end of which is the elector's palace. The streets here intersect each other at right angles; so that at each corner the spectator has a view of four streets. Before the palace is a large square, in which is a considerable number of lodging-rooms, with a great and high pavilion in the middle, and two advanced wings, with ample pavilions at the ends, where two other very extensive wings rise on both sides, which are also terminated by pavilions, behind which are other lodging-rooms; and before the palace is an equestrian statue of metal, of the elector John William.

Within the palace are two great courts separated by an open gallery, very much adorned with architecture. The apartments are beautified with noble cielings and floors, and have the finest prospect imaginable to Spires, Fran-

Frankendahl, Worms, and over all the country, as far as the mountains of Alsace. The collection of paintings in this palace is very grand, and, in what is called the treasury, is a considerable number of antiquities relative to the Palatine-house, and among others the golden crown of Frederic the unhappy elector and king of Bohemia.

In the great market is the popish church, and the council-house, between which stands a tower, that is a great ornament to this square, as is also a fine fountain, which has four pillars, on which stands a lion. The Lutherans and Calvinists have also each a church, and the Jesuits a fine college, with a very beautiful church. There are here also a Capuchin and a Carmelite convent, and also a Jewish synagogue. The Jews indeed are very numerous, and two thirds of the houses are said to be theirs, either from their building them, or on account of mortgages; for some of them are very rich, and drive a great trade with those of their own nation at Mentz, Francfort, and Amsterdam.

The people of both sexes are here of a very amiable character, being extremely social and civil to strangers. The nobility here maintain a company of French comedians, who act in a very small theatre; but both the townsmen and foreigners pay for admittance. Mannheim has some manufactures, and carries on a considerable trade.

Heidelberg, the principal town of the electorate, is seated in a pleasant spot on the river of the Geisberg near the Neckar, in the forty-ninth degree thirty-six minutes north latitude, and in the eighth degree fifty-five minutes east longitude, enjoying a wholesome air, and very good water. It is surrounded with hills covered with vines; except on the west, where is a large and fruitful plain, through which the Neckar runs. The town at present is but small, though finely built. It is adorned with an university, managed by an academical senate, consisting of three divinity professors, four for law, three for physic, and six for philosophy. They have a rector magnificentissimus, who is a kind of chancellor, and is commonly the elector himself; and likewise a rector magnificus, like the vice-chancellor of Oxford or Cambridge, who is president of the senate, and chosen annually out of the professors. The first chair instituted for publicly teaching the law of nature and nations, was founded here for the famous Puffendorf, who here began his system, which he finished in Sweden.

This city has suffered much by wars, especially from the French; so that since the disgrace of Frederic elector Palatine, it has been taken, plundered, and burnt four times. The elector's library, which was kept in the church of the Holy Ghost, was, according to Scaliger, better filled with valuable books than even the Vatican at Rome, and exceeded all in the empire for the number of its curious manuscripts; but when count Tilly, the imperial general, took this city in the year 1622, and put five hundred Palatines in it to the sword, great part of this library was sent to the Vatican. In 1688 the French again seized this city; but upon the approach of the imperial army, they, contrary to the capitulation with the Dauphin, blew up the castle, and laid the town in ashes, together with the elector's noble palace, the churches, and other public buildings. The French, to add to their brutality, would not suffer the citizens to leave the city; but shut them up in the great church till they burnt the city; and then also consumed that. Heidelberg was afterwards rebuilt, and had a considerable garrison; but the French under marshal de Lorge attacked it again in 1693, and by the treachery of the governor, the city was soon taken, and the people brutishly murdered, except those who could get into the castle. Upon the first entrance of the French, the ladies and others sent to solicit the general to spare their honour. This he promised, and ordered them all to retire into the great church, where, contrary to his promise, they were brutally ravished and stripped. The French at this time laid the city in ashes, broke up the electoral tombs, and turned the inhabitants, who amounted to about fifteen thousand out of the town by night, when being deprived of all they

had, many died of want, particularly women with child, who fell in labour with the fright.

After this the elector encouraged the people to rebuild the city, promising them exemption from taxes for thirty years, with full liberty of conscience; but being of the Romish religion, he was soon prevailed on by the Jesuits to make one of their society a professor in the university, and oppressed his protestant subjects, till the elector of Brandenburg and other protestant princes, interposed in their behalf.

In 1709 the French again seized Heidelberg, and laying the neighbouring country under contribution, the inhabitants were so impoverished, that several thousands of them fled to foreign countries, particularly England, from whence they were sent to Ireland and the British colonies in America. This city, however, began to recover itself, when the elector being disgusted at the Calvinists, for refusing to deliver up to him the body of the great church, which had been allotted them by the peace of Westphalia, the choir being in the possession of the Roman catholics, quitted Heidelberg, and went to reside at Mannheim, since which this city has ever since been decaying.

The principal beauty of Heidelberg consists in one large handsome street, with a spacious square, and uniform market. The elector's castle, or palace, on the ascent of a neighbouring hill called Conigstahl, which overlooks the whole city, was remarkable for its strength, and was beautified with fine gardens and grottos. Near it is a strong tower, which since the peace of Westphalia was called the Star-fort. This palace is enclosed with a wall hewn out of the rock.

Several towns have been already mentioned as famous for their having tons of an uncommon magnitude, which proceeds not only from the fondness of the Germans for drinking; but to shew that wine is one of the most profitable branches of their trade in the provinces near the Rhine and the Danube, and none of these tons is more famous than that of Heidelberg. In a cellar under one of the towers of the elector's palace stood one of an extraordinary size, it being capable of holding five hundred and twenty-eight hogsheads, or twenty-six thousand two hundred and fifty gallons Paris measure. This was rebuilt, and made to hold six hundred hogsheads English measure. The old one had iron hoops; but the new one had large ones of knee timbers, like the ribs of a ship, with several inscriptions, and was very neatly adorned with carved work and gilding. On one side was a handsome stair-case of forty-three steps leading to the top, on which was a gallery encompassed with balustrades, and on this platform the electors have had frequent carousals. This ton having been first emptied, was knocked in pieces by the French in 1688; but the elector has had a new one made which is larger; this is also decorated with variety of ornaments; but is inferior in size to that of Konigstein in Saxony.

The palace bears the marks of the ravages committed there by the French, a great part of it being so ruinous, that of four considerable mansions, of which it consisted, only one escaped undamaged. The remains of the palace are in a stile neither Gothic nor modern; but all the orders are jumbled together, without either fancy or judgment. It has a magnificent terrace towards the town, whence there is a prospect of the plain, and of the country for several leagues round. The inside is scarcely more regular than the outside, and the elector's apartment consists of a long suite of rooms, without beauty or proportion.

The Calvinists are in the possession of St. Peter's church, which stands in the suburbs, and the Lutherans of the church of Providence. The Jesuits have a fine college and a church; and there are also six convents in the town, with churches in them. The university of Heidelberg was founded in the year 1346, and entertains fourteen professors in ordinary, among which six Jesuits teach divinity, natural philosophy, mathematics, and moral philosophy. Mr. Keyser observes, that the number of protestant students amount to about a hundred and eighty; but the popish students do not exceed a hundred. The *collegium sapientiae* was formerly an Augustine cloister, which,

which, in 1553, was appointed for the residence of poor students: it at present belongs to the Calvinists, and in it are twelve students, who are provided with lodging and board.

One of the most remarkable structures in the city is the town-house, once famous for its curious clock, which had a variety of movements, with several figures of men fighting, and a cock which crowed when the hour struck.

The city is divided into five jurisdictions, and the inhabitants ranked under so many classes, the members of each not being obliged to appear before any court but their own. It is also divided into four wards under a burgomaster. The generality of the inhabitants being Calvinists, church affairs are usually managed by a presbytery, consisting of twenty-one deputies.

About a mile from Heidelberg are three streams, which spring from a hill, down which they flow; and, after filling five ponds, and passing three water-falls, run with so strong a current through the adjacent plain, as to turn several mills.

Among the principal places in the Palatinate of the Rhine are generally reckoned Worms and Spire; but as both these are in the Upper Circle of the Rhine, and neither of them subject to the elector Palatine, we shall defer treating of them till the beginning of the next chapter.

The most considerable towns in this electorate, next to those that have been described, are Frankenthal and Oppenheim.

C H A P. XVII.

The Circle of the U P P E R R H I N E.

S E C T. I.

Of this Circle in general; and first of the Bishopric of Worms: Its Situation, Extent, and Produce. The Religion of the Inhabitants; with the Dignity, Titles, Arms, and Prerogatives of the Bishop; and a particular Description of Worms, the Capital of the Bishopric.

FROM this circle most of the lands and states situated on the other side of the Rhine, have been gradually taken away by France; as the greatest part of the bishoprics of Strasburg, Mentz, Tull, and Verdun, with the archbishopric of Besançon, the dutchy of Lorrain, &c.

This circle is at present terminated by the electoral circle of the Rhine, by which it is also intersected: it is likewise bounded by the Westphalian, the Lower Saxon, the Upper Saxon, the Franconian, and Swabian circles; together with Alsace and Lorrain.

The circle of the Upper Rhine at present comprehends the bishoprics of Worms, Spire, Strasburg, Basil, and Fulda; the dutchy of Deux-Ponts, the landgravate of Hesse, Hersfeld, Sponheim; as also the margravates of Nassau-Weilburg, Nassau-Usingen, Nassau-Idestein, Waldec, Hanau, &c. with the imperial cities of Worms, Spire, Francfort, Friedberg, and Wetzlar. Hesse-Cassel and Hanau-Munzenberg have been for some time separated from the circle.

The diets of the circle of the Upper Rhine were formerly held at Worms; but during the present century they have been constantly held at Frankfort, yet the chancery-circle of the archives belonging to it are kept at the directory at Worms. This circle, with respect to its religion, is reckoned among the mixed.

After this short introduction we shall begin with the bishopric of Worms, which is about twelve miles long, and is, for the greatest part, surrounded by the Lower Palatinate, and the rest by the territory of Mentz.

This country is for the most part mountainous and woody, but has some fruitful arable lands, meadows, and vineyards. It is likewise plentifully watered; for the Rhine running through it, receives several smaller rivers in its course.

The Protestant churches in this bishopric retired in 1705 from the Palatinate of the Rhine to the bishopric of Worms, where they are at present in an oppressed state. They have no longer any particular church-government of their own; but are subject in ecclesiastical and matrimonial affairs to the regency of Worms, and that regency nominates the pastors and school-masters. However, one of the Protestant preachers is inspector over the rest.

The arms of this bishopric are a silver key, with the wards turned upwards, having on each side four golden stars in a black field.

The bishop of Worms is subject to the archbishopric of Mentz. In the circle of the Upper Rhine, he is the summoning prince and director; and in the council of the princes of the empire, he exchanges place on the spiritual-bench with the elector of Wurtzburg. The chapter is seated in the imperial city of Worms, and consists of thirteen capitulars and nine domicelli.

The princely regency here consists of a president, a chancellor, aulic and regency-counsellors, and secretaries; the aulic-judicatory, of a president, an aulic-judge, commissaries, and counsellors, who are all members of the regency, together with the secretary; the aulic-chamber, of a president, provincial-clerk, counsellors, secretary, and fiscal-general; and the episcopal vicarship, of a vicar-general, official and spiritual counsellors.

The principal places in this bishopric are the following:

The imperial city of Worms, which is the capital of the bishopric of the same name, is seated on the west side of the Rhine, within the limits of the Palatinate, in the forty-fourth degree thirty-six minutes north latitude, and in the eighth degree ten minutes east longitude.

The magistracy here is Lutheran, the city being accounted one of the free Lutheran imperial cities, with toleration and freedom of worship to the Catholics. The Lutherans have a church which they have rebuilt in a handsome manner, in which Luther is represented as appearing at the diet in 1521. They are also in possession of the old church, as it is called, St. Magnus's now in ruins, and St. Leonard's a little way out of the town. Those of the Romish church are very numerous, and are in possession of all the rest. The Calvinists have a church at Neuhausel, about half a league out of the town, where the Lutherans sometimes bring their children to be baptized. The Roman catholics do not here carry the Host in public, nor make any procession except on the day after Easter.

The antient cathedral which was a long, lofty, and strong building erected in the Gothic taste, had a tower at each of the four corners. Over one of the doors was a figure of the size of an ass, with four heads, those of a man, an ox, an eagle, and a lion: the right foot was also that of a man, the left that of an ox, and the two hinder feet resembled those of an eagle and a lion. Upon the back of this figure sat a woman. The people here related very odd stories of this animal, which the learned supposed to be an hieroglyphic, composed of the four beasts in the vision of Ezekiel, and that the woman was designed to represent the Gospel. This cathedral, since its destruction by the French, has been rebuilt with great magnificence.

Near the entrance of St. Martin's church is a picture, just over a moveable altar, which, from the oddness of the conceit, and the low and profane idea of the painter, has not escaped the notice of travellers. It is about five

feet square, and at one of the corners on the top is represented the Almighty, whom the heaven of heavens cannot contain, in the figure of an old man, who seems to address himself to the Virgin Mary, who is placed on her knees in the midst of the picture, holding the infant Jesus by the feet, and ridiculously putting the head of the Redeemer into the hopper of a mill, which is turned by the twelve apostles, by the help of a wheel, assisted by the four beasts of Ezekiel, who are on the other side; while the pope is drawn upon his knees, receiving the hosts that fall from the mill into a golden chalice, one of which he presents to a cardinal, who gives it to a bishop, the bishop to a priest, and the priest to a layman.

In short, the Romans have, besides the cathedral, four collegiate, and the same number of parish-churches, in or near the city, a Jesuits college and seminary, three monasteries, and three nunneries.

Here are two public halls, in one of which the magistrates assemble twice a week upon matters of state, and in the other for the administration of justice. In the first of these Luther made his solemn appeal, in relation to which the people here say, that the doctor being much heated by the eagerness with which he discoursed, and also by a fire that was near him, desired a glass of wine, which being brought, he forgot to drink it; but being still eager in pursuing his discourse, set it down upon a bench, when it soon after broke without being touched by any body; whence it currently passed, that some poison was mixed with the wine, of which the Lutherans were so fully persuaded, that they broke the bench on which the glass stood into shivers, and kept some pieces of it, which are still preserved in memory of Luther's deliverance.

The bishop's palace was rebuilt in the year 1719, at the expence of Francis Lewis, the bishop.

The mint is a noble structure, with a spacious portico, where vast numbers of bones and horns hang between the arches; the former are said to be those of giants, and the latter the horns of the oxen that drew the stones of which the antient cathedral was built.

Since this city has been laid in ashes by the French, it has little left besides the shadow of its former beauty. The richest traders, considering how much both they and their ancestors had suffered on account of their lying so open to France, retired to Frankfort and Holland; so that the principal trade of the city, and the support of the inhabitants, depends on the bishop and his chapter. The citizens are, however, very complaisant to strangers. It is said that there is so much vacant ground in the city as, by being planted with vines, annually yields fifteen hundred fadders of wine, each containing two hundred and fifty English gallons; and it is so much esteemed, that the magistrates make presents of it, with some fish, to princes and other travellers of quality. The fine plain in which the city stands abounds with corn, vineyards, and fruit-trees; and here grows that Rhenish wine, which, from its delicious taste, is called our lady's milk.

The senate, or supreme council of Worms, is composed of twenty-five members, thirteen of which are for life. The city has the fourth seat on the bench of the imperial cities of the Rhine, and likewise votes in the diet of the circle of the Upper Rhine. The bishops of Worms have often contested its independence, and both by hostilities and excommunication have extorted conventions, among which that of 1519 is particularly remarkable, it being agreed, that in suits exceeding fifty guilders, an appeal lies from the city-court to that of the bishop; but if, before the appeal be entered upon, the appellant petitions for the removal of his cause to the emperor, or the aulic-council, the bishop must not only comply, but transmit the papers.

There is scarce any place so famous for interviews of sovereigns, the nuptials of kings and princes, and other solemnities; several diets have also been held here. This was the place where the reformation began in 1525, and in the year 1743 king George II. took up his quarters in this city, and lodged at the bishop's palace after the battle of Dettingen.

S E C T. II.

Of the Bishopric of SPIRES.

Its Situation, Extent, and Fertility. The Arms, Privileges, and Colleges of the Bishop; with a concise History and Description of the Cities of Spires and Philipsburg.

THE bishopric of Spires, or Spire, is seated on the banks of the Rhine, and is for the most part environed by the electoral Palatinate; but is in some places bounded by the margravate of Baden-Durlach, extending thirty-two miles in its greatest length, and twelve in breadth.

It is partly woody and partly mountainous, but enjoys good arable lands, and has groves of chefnuts, almonds, and vineyards. It is a pleasant country; but the natives wanting a vent for their commodities, the Palatinate by which it is enclosed being equally fertile, are very poor; besides, the people have frequently suffered the calamities of war.

The arms of the bishopric are a cross argent in a field azure.

The bishop of Spires is subject to the archbishop of Mentz, notwithstanding which he is a prince of the empire, and in the council of the princes has a seat and voice on the spiritual-bench between the bishops of Aichstadt and Strasburg, and takes the second place at the diets of the circle of the Upper Rhine.

The seat of the cathedral and chapter is in the imperial city of Spire. The chapter consists of fourteen capitulars and thirteen domicelli.

The colleges here are the regency, the episcopal vicarship, the aulic-jurisdiction, and the aulic-chamber.

The principal places in this bishopric are the following:

The city of Spire, or Spires, is seated in a delightful plain, on the east side of the Rhine, where it receives the small river of Spirebach, in the forty-ninth degree twenty minutes north latitude, and in the eighth degree twenty minutes east longitude, sixteen miles to the southwest of Heidelberg. Its German name is Speir, and in Latin it is called Spira, Noviomagus, or Numetum, and is thought to have been built by the Belgæ. The Romans after its falling into their hands augmented and walled it, on account of the convenience of the passage into Germany; but it was taken and plundered by Attila in 451, and never recovered this disaster till the time of Charlemagne, who built here a royal palace. The emperor Henry IV. enclosed it with walls and ditches, kept his treasure here, made it an imperial city, and built many noble structures, particularly the cathedral, in which he and several bishops were buried. At length the Spaniards took this city; but soon abandoned it on the approach of the Swedes, and carried off the artillery, gun-powder, and salt-petre, after having exacted eight thousand rixdollars from the inhabitants. The Swedes took possession of it; but not being able to spare troops for garrisoning the place, they demolished it. In 1688 it was taken by the French, who the next year, upon the approach of the Germans, burnt most of the city, with the cathedral, since which disaster it has not recovered its pristine splendor; for after its total destruction by the French in 1689, and lying waste ten years, on the peace of Ryswic it was rebuilt, but with less beauty.

The choir of the cathedral is beautifully repaired; but the superb marble monuments of eight emperors and three empresses were broken in pieces by the French, who also opened and pillaged the vaults, and threw about the bones of the illustrious dead. This church has a large revenue; but its expences are also large. Besides three other foundations, among which is a college of Jesuits, there are several popish parish churches, convents, and nunneries. The Lutherans, indeed, outnumber the other inhabitants; but have only two churches and an academy; and the Calvinists, whose number is not considerable, have only one church. The magistrates of the city are of the Lutheran persuasion.

This

This city has the fifth seat among the imperial cities of the circle of the Rhine, and votes in the diet of the Upper Rhine.

The burghers are divided into fifteen companies, out of which a certain number is chosen, who have the executive power.

A new bishop, before his entrance into the city, is obliged to redress the complaints of the inhabitants; and afterwards sitting on horseback in the open air, between the two outermost gates, which during the ceremony are shut, with one hand in his left breast, he pronounces a blessing on the city; then binds himself not to infringe its privileges; but rather to vindicate and increase them, and to live in harmony with the inhabitants. He then makes his public entry, and the citizens pay him homage.

Before the destruction of this city by the French, the imperial chamber was held here; and in 1529, a diet was held in this city that was peculiarly remarkable, as having given rise to the name of Protestants.

Philipsburg was at first a small town called Udenheim; but lying conveniently for commanding the adjacent country, Philip, bishop of Spire, chose it for his residence, fortified it with seven royal bastions, and at length gave it his own name. But the combined electors and princes, particularly Frederic V. elector Palatine, as superior, with the margrave of Baden-Durlach, suspecting the bishop's design in fortifying this place, ordered him to desist; but he refused, alledging, that he had the emperor's placart to warrant what he had done. Upon which these princes agreed at an assembly summoned at Heilbrun, to send thither four thousand horse and foot, with twelve hundred pioniers, and the necessary artillery, who on the fifteenth of June 1618, demanded and took possession of the place, and upon this razed all its fortifications; for which the emperor summoned these princes before the chamber of Spire, and designed to proceed against them with the utmost severity. This was one of the causes of the thirty years civil war in Germany.

This city has suffered seven memorable sieges in the space of an hundred years, and its works have at different times been greatly increased; particularly Lewis XIV. of France in 1666, extended its fortifications to the Rhine, which lies a quarter of a league from the town, and over the great gate caused an inscription to be put up, "That this fortress he strengthened as a monument of his own valour, and of the recovery of the liberty of the Germans, for the terror of his enemies, the support of his allies, and the security of the French;" concluding with these words, "What he shuts no man opens, and what he opens no man shuts." But in 1678, it was retaken by the Imperialists, when the emperor ordered that inscription to be erased, and another to be put up, "That Leopold, the emperor, having undertaken a necessary war, took this fortress by siege, that it might be a monument to posterity of his breaking off the yoke of slavery from the neck of Liberty," concluding with "What the French shut, the Germans open." The Germans having thus regained it after a siege of four months, it was granted them by the peace of Nimeguen. But in 1688, the French retook it, and it was restored to the empire by the treaty of Ryswic in 1697, with its fortifications on the right side; but those on the left, together with the bridge, were demolished. This place was taken again by the French in 1734, after a long and bloody siege, in which the famous duke of Berwick, natural son to king James II. was killed by a cannon ball, between his two grandsons, as he went to take a view of the trenches; but it was restored in 1739.

The town belongs to the bishop of Spire, who has an office here; but it is considered as a fortress of the empire, and has a governor and commandant appointed by it. The castle, which is the residence of the bishop of Spire, is said to be a noble pile which stands in a plain surrounded with marshes; but the town is much fallen to decay.

SECT. III.

The Bishopric of FULDA.

Its Situation, Extent, and Rivers. The Religion of the Inhabitants. The Titles, Arms, and Prerogatives of the Bishop; with a Description of the City of Fulda.

FULDA is surrounded by Hesse, the counties of Isenburg and Hanau, the bishopric of Wurtzburg, and the princely county of Henneburg, extending in its greatest length sixty-two miles, and in its greatest breadth upwards of forty-seven miles.

It is a mountainous and woody country; but has rich arable lands, and salt springs. Its principal rivers are the Fulda, which rises here, and the Sala, which issues out of the territory of Wurtzburg.

It contains sixty parish, and ninety-four filial churches, among which nine of the parish, and a few of the filial churches are Lutheran; but the rest popish.

The title of the bishop of Fulda runs thus, Bishop and abbot of Fulda, prince of the holy Roman empire, arch-chancellor of the reigning Roman empress, primate of all Germany and Gaul.

The arms of Fulda are a black cross, in a field argent.

The bishop and abbot has a seat and voice in the council of the princes of the empire, and is also a member of the circle of the Upper Rhine. The high chapter consists of fifteen persons, and the high college is composed of the regency and the feudal court, the spiritual vicarship, and the aulic chamber.

The bishop, who is subordinate to the pope alone, has four great officers of state, rich equipages, a magnificent household, a company of horse guards well clothed and mounted, and a regiment of foot guards.

This bishopric is divided into twenty little bailiwicks, the principal place in which is,

Fulda, the capital and residentiary town of the bishopric, is seated on the river Fulda, and owes its original to the abbey, near which was at first a village, which being enlarged, was about the year 1162, surrounded with walls, and erected into a town. It has a royal palace built with free-stone, and the principal church is dedicated to Christ. The collegiate church of St. Boniface was antiently called the parish church of St. Blaise; but in the year 1650, the chapter of St. Boniface, which till that time had continued at Great Borsla, was translated to Fulda; it has also a college of Jesuits, with a gymnasium and papal seminary, a nunnery of Benedictines, and an university founded by the bishop in the year 1734.

SECT. IV.

The Landgravate of HESSE.

Its Situation, Extent, Produce, and Rivers. Of the Diets of the Country, the Prerogatives of the Houses of Hesse-Cassel and Hesse-Darmstadt; their Titles, Arms, public Offices, and Courts, Revenues, Forces, and principal Towns.

THE landgravate of Hesse terminates on the bishopric of Fulda, the principality of Hersfeld, Thuringia, and Eichsfeld, as also on that of Calenberg, the bishoprics of Paderborn and Waldec, and the dutchy of Westphalia. This landgravate is above ninety-five miles in length.

The country is for the most part hilly and woody; but has pleasant valleys, and is interspersed with good corn and pasture-lands. It also produces plenty of excellent wine, and particularly abounds in cattle. With respect to minerals, silver, copper, lead, and iron are at present found in great quantities in this country; as also allum, vitriol, pit-coal, sulphur, boles, a porcelain earth, marble, and alabaster. It has likewise salt springs, baths, and mineral waters, with an uncommon plenty of game and fish.

With

With respect to the rivers, the principal are the Rhine and the Maine, with the Lahn, or Lahn, which after being joined by many smaller streams, falls into the Rhine: the Fulda, which proceeds from the bishopric of that name, and falls into the Werra; and the Diemel, which runs into the Weser.

The states of Hesse-Cassel consist first of the prelates, these are composed of the commandery of the Teutonic order for Hesse, at Marburg: of the rector and senate of the university of Marburg: of the four provosts of the canonries of Künffungen and Wetter, and the governors of several hospitals. The other parts of which the states are composed, are the nobility, who are distinguished by the five rivers Lahn, Schwalm, Fulda, Werra, and Diemel: and lastly, the towns, which are also divided according to the countries lying on these five rivers, in each of which is a summoning town that sends two representatives to the general and particular diets; but the other towns assist at them only in turns, according to a settled rotation.

In the diets of Hesse-Cassel and Hesse-Darmstadt presides the hereditary marshal. The sovereign of both houses may assemble at pleasure any particular diet, and then the landgrave of Hesse-Cassel sends orders throughout his whole country for them to appear by their deputies. Cassel is generally the place of assembly for those of Hesse-Cassel; but they sometimes meet at Treysa. The diets of Hesse-Darmstadt are invariably held at Gießen, and in both the sovereign is represented by a commissioner.

The house of Hesse-Cassel forms one of the states of the Calvinist religion, and that of Hesse-Darmstadt of the Lutheran; of the collateral lines Rothenburg is Popish, and Homburg and Philippsdale Protestants. It being known in the year 1754, that Frederic the hereditary prince of Hesse-Cassel had, in 1749, embraced the Romish religion, that prince voluntarily drew up and confirmed by oath an instrument declaring, that his present and future children should be brought up and instructed only in the Protestant religion; and that on his accession to the government, no manner of alteration should be made with respect to religion; but that he would preserve it in every particular as it then stood unmolested and entire.

In Hesse are two sovereign families, between whom all the Hessian territories are divided, namely, those of Cassel and Darmstadt; but many articles have continued in common, as, 1. The feudal power and investiture of the princes of Waldec, which has ever been performed in the name of both landgraves. 2. The joint-court of justice at Marburg, which has its judge and assessors, from whom, in processes of above a thousand guildens of gold, an appeal lies to the aulic-council; but if it exceeds only one hundred, to the court of revisions. 3. The court of revision, or appeals, held alternately six years at Marburg, and six at Gießen. 4. The portioning of the princesses, to which the subjects of both sovereigns contribute. 5. Both sovereigns have arbitrators, which are chosen in disputes between them, and to whose verdicts they submit.

Their titles are also nearly the same; as landgrave of Hesse, prince of Hersfeld, count Katzenellenbogen, Dietz, Ziegenhayn, Nidda, and Schomberg; to which Hesse-Cassel adds Hanau and Hesse-Darmstadt, Isenburg, and Budingen.

The arms of Hesse are a shield twice longitudinally divided, and three times transversely, with a scutcheon of pretence azure, the Hessian lion argent, and three diadems gules. In the first dexter shield argent, is a patriarchal cross gules, for the principality of Hersfeld. In the second shield, party per fesse, sable and or, with a star argent, for the county of Ziegenhayn. The third field has a lion rampant gules, crowned azure, for Katzenellenbogen. The fourth field gules, two lions passant or, for the county of Dietz. The fifth field party per fesse, or and sable, two stars with eight points argent, for the county of Nidda. The sixth field party per bend, gules and argent, within a nettle leaf on three segments, in each of which is a carnation argent, for Schomberg.

The landgrave William added the Hanau shield, which is quarterly; in the first and fourth fields or, three chevrons gules, for the county of Hanau; but in the second

and third field or, three bends gules, for the county of Reineck; likewise a scutcheon of pretence party per fesse, or and argent, for the lordship of Munzenberg. The landgraves of Hesse-Darmstadt also add to the arms of Isenburg and Budingen a shield argent, two bendlets sable. The two collateral princes of Hesse-Cassel bear the Hessian shield alone; but those of the line of Darmstadt add to it the arms of Isenburg.

Both Hesse-Cassel and Hesse-Darmstadt have a privy-council. In the former are two regencies, viz. one at Cassel for Lower Hesse, and the other at Marburg. In Hesse-Darmstadt are also the same number, one at Gießen and one at Darmstadt.

With respect to the courts at law, there are the joint-court of justice held at Marburg; besides which ecclesiastical and matrimonial cases come before the two consistories of Hesse-Cassel, held at Cassel and Marburg; and those for Hesse-Darmstadt at Gießen and Darmstadt. For the trial of noblemen, or persons of eminence guilty of any great crime, a particular criminal court, if desired, is erected.

With respect to the taxes, ordinary and extraordinary, the country seats of the nobility, with the lands and effects belonging to the clergy and the schools, are exempt from the ordinary taxes; but with regard to the extraordinary ones, the four hospitals, with the tenants and lands of the priests and schools, are excepted. The provincial chest is under the management of four receivers-general, who enjoy their office for life, and these nominate the collectors. The annual revenue of the landgrave of Hesse-Cassel is computed by some authors at a hundred and twenty thousand pounds a year, and that of Hesse-Darmstadt at about half this sum.

Cassel and Darmstadt have each their war-office, and the landgrave of Hesse-Cassel constantly keeps on foot twelve battalions and eight squadrons, with a troop of hussars and three hundred matrosses. Hesse-Darmstadt maintains a body of horse guards, two squadrons of dragoons, and four battalions of regular militia.

The principal city belonging to the sovereign-house of Hesse-Cassel is the city of Cassel, which is seated on the river Fulda, and flows between the Old and New Town, in the fifty-first degree eighteen minutes north latitude, and in the ninth degree thirty-eight minutes east longitude, and has a stone-bridge erected over the river. The Old Town, which is the largest and most considerable, forms a semicircle on a hill, and, like the Lower New Town, is old-fashioned; but the French, or Upper New Town, is very regular and handsome; and between it and the Old Town lies the esplanade, which is delightfully planted with rows of trees. The palace of the prince is of free-stone and very handsome both within and without; it stands in the Old Town, on the banks of the Fulda, but is a distinct fortification. In the Lyceum is an anatomical theatre, a museum, a *collegium Carolinum*, a cabinet of antiques and natural curiosities, and an observatory well furnished with instruments. Over the stable is the sovereign's library. As all the public offices meet here, the building designed for their use is a noble piece of architecture. The arsenal is of free-stone, and contains arms for twenty-five thousand men, and in the room under it are two hundred cannon; it has a foundery, which stands at a small distance. In the French New Town the landgrave William VIII. has added to the house in which he formerly lived, a fine gallery of paintings. In this Upper New Town is also a beautiful church; but the principal church in Cassel is that of St. Martin's abbey in the Old Town, in which lies the burial-place of the princes, and near it is a public Latin school. In the Old Town are likewise two churches, one of which belongs to the garrison; and on the ramparts a third belonging to the Lutherans, the first stone of which was laid in the year 1734. The way from the palace-bridge over the lesser Fulda leads to the prince's flower-garden, near which is a large green-house, and an elegant marble bath. In the center of the garden is a spacious basin, in the midst of which is a beautiful mount. This delightful place is surrounded by the Great and Little Fulda.

At Cassel are manufactures of cloth, stuffs, gold-lace, hats, silk and worsted stockings, and other commodities.

The pleasure-houses belonging to the prince are Freyenhagen, which lies at the end of a road leading from Cassel, planted on each side with trees: Weiffenstein-house, also near Cassel; and at a small distance from it is Carlsberg, where is an admirable cascade, begun by the landgrave Charles. On each side are eight hundred steps leading up a hill, and at the top is a grand pyramid of huge stones arranged in a transverse and vertical position, and surmounted by a Hercules of copper thirty feet high. The prospect here is inexpressibly fine. The cascade has four platforms, with a spacious basin in each. Near the upper basin is a splendid grotto of large rough hewn-stones, that look as if only placed upon each other without cement. In the second is a rock consisting of heaps of stones disposed in a most beautiful confusion, and under it a giant lying on his back, and ejecting a stream of water six inches in diameter, to the height of forty feet; while the crystalline water falling nearly perpendicular, winds through apertures which are almost imperceptible in innumerable meanders. The descent of the cascade on each side the basin consists entirely of large square stones, over which the water runs about an inch in depth, and a little way forward over a thin sheet of lead about three inches broad, precipitating itself from one platform-stone to another, and having the appearance of crystalline mirrors; but by a spectator standing at the bottom, the brilliancy, when the sun plays his beams upon it, cannot be viewed without admiration. The water for this work is brought from several streams up the mountain, and collected in a reservoir one hundred feet deep, and of considerable extent.

Marburg, or Marburg, the capital of Upper Hesse, is seated on a hill near the river Lahn, in the fiftieth degree forty-four minutes north latitude, and in the eighth degree fifty-three minutes east longitude; and above it is a fortified castle that was once the residence of the landgrave of Hesse. Besides the sovereign courts and public offices, it has an academy for classical learning, with three churches, one of which is French, and the Lutheran church of St. Elizabeth, in which it is pretended that saint lies interred. Her monument is plated over with silver gilt, adorned with a profusion of pearls. In this church have also been buried several of the landgraves of Hesse. The German-house is the residence of the provincial commander of the Teutonic order for Hesse, and the commander of Marburg; and near it stands Elizabeth's hospital, the care of which St. Elizabeth, they say, recommended to the above order. The provincial commander, by the convention of Cassel, is chosen alternately from each of the three religions. The prince of Hesse has a fine stud of horses here.

Marburg has been twice destroyed by fire, and in 1529 a solemn but fruitless conference was held here between Luther and Melancthon on the one side, and Zuinglius and Oecolampadius on the other. Towards the close of the year 1645, and the beginning of 1646, this town and castle were taken, after a furious cannonading, by the troops of Cassel, which the princess Amelia Elizabeth, at that time regent of Cassel, sent against it.

Gießen is a fortified town on the river Lahn, and has an old castle and arsenal. In this town, alternately with Marburg, is held the joint court of appeals: it is likewise the seat of the regency, a consistory and superintendency, and has also a Lutheran university founded here in 1607, a classical academy, and two churches. It is subject to the house of Hesse-Darmstadt, and is defended by a strong wall and regular fortifications.

Darmstadt is seated on a river of the same name, in a fruitful and pleasant country, and has a very stately palace belonging to that branch of the Hessian house to which it gives name. It has also a regency, a court of appeals, a consistory, and a grammar-school, and in the church are the vaults of the princely family. It is encompassed with a wall, and has several suburbs, near which is an orphan-house.

Homburg, a town subject to the house of Hesse-Homburg, by whom it was built, and inhabited by two French colonies, contains a palace in which that prince resides. Both the Lutherans and Calvinists here enjoy the public exercise of their religion. The landgrave

Frederic II. has added a handsome new town, in which an orphan-house and alms-house have been erected by the prince, who is proprietor of three prefectures in the territories of Magdeburg and the Halberstadt, exclusive of other personal rights and revenues.

SECT. V.

The County of WALDEC.

Its Situation, Extent, and Produce. The Religion and Manufactures of the Country. The Titles and Offices of the Prince, and a Description of the principal Towns.

THE county of Waldec is bounded on the north by the diocese of Paderborn; to the eastward by Hesse, and the electorate of Mentz; to the southward also by Hesse; and to the westward by the dutchy of Westphalia; extending, according to Dr. Busching, about twenty-eight miles in length, and twenty-three in breadth.

This country abounds in grain and cattle. It has also large woods, and the mountains contain iron, lead, copper, and even some gold, which is esteemed equal in value to that of Hungary. Of the gold gathered out of the Eder the prince has caused medals to be struck, and a magnificent side-board of plate to be made. Some parts also afford alabaster, marble, and slate.

This country contains thirteen towns and a market village. The states are composed of the nobility and towns. It is only on extraordinary occasions that the whole body of the states are convened; for on ordinary occasions, none meet but the nobility and the representatives of the three deputy towns.

The greatest part of the inhabitants are Lutherans, and the rest Calvinists, except a few who are of the popish religion.

The manufactures of this country are coarse cloth, barragons, calamancos, dimity, ratine, and other stuffs; paper, and great quantities of hard-ware.

The titles of the Waldec family are, Prince of the sacred Roman empire, count of Pymont and Rappolstein, lord of Hoheneck and Gerolseck, &c.

The prince of Waldec has not yet obtained a seat and vote in the college of princes; but enjoys a seat at the diet of the circle of the Upper Rhine.

The prince has a privy-council and court of siefs, a regency, a chamber of finances, a forest court, and a court of law. The two last courts are composed of the same members, who also, in conjunction with the general, and one superintendant, form the consistory. From the court of law an appeal lies to the chancery. Over the prefectures preside four judges, who are subordinate to a rural chief justice.

The principal places in this county are the following:

Corbach, the capital, and the first of the three deputy towns, is also the seat of the high court of justice, and consists of the Old and New Town, each of which has its church. In that belonging to the New Town is a most stately monument of marble and alabaster, that takes up one side of the choir, and was erected by the republic of the United Provinces to George Frederic of Waldec, who was field-marshal of their forces. In the New Town is also a gymnasium of six classes, and seven masters.

Wildungen, a town seated on a hill, and the second deputy town, is both larger and better built than Old Wildungen; it has a Latin school, containing five classes, and an orphan-house. In the choir belonging to the church, the republic of Venice here erected a fine monument of alabaster to the memory of Josias prince of Waldec, who commanded their armies with great reputation.

Arolsen, a regular built, thriving town, seated near the river Aars. The prince's palace, of which prince Frederic Anthony Ulric was himself architect, makes a grand appearance. All the above-mentioned offices and colleges, except the chief court of justice, are held here. Besides the Lutheran church, the Calvinists and Romans have also theirs. This town stands at the end of a noble

ble avenue, formed by six rows of trees, two thousand paces in length.

S E C T. VI.

Of the County of HANAU.

Its Situation, Extent, Produce, and principal Rivers; the Religion of the Inhabitants; with a Description of the City of Hanau.

HANAU is encompassed by the electorate of Mentz, the diocese of Fulda, with the territories of Hesse and Francfort; extending about forty-two miles in length; but some parts of it lie separate.

The soil is remarkably fertile in corn, wine, fruit, and vegetables, all which are excellent in their several kinds. It has also a silver and a copper mine, both of which are very rich, and likewise some cobalt-works and salt-pans. Great advantage is likewise made of the woods.

This country lies chiefly on the Maine, into which run all the smaller rivers by which it is watered. Among these the chief are the Kinzig and the Nidda, the latter of which is joined by the Nidder.

In the sixteenth century the inhabitants embraced Lutheranism; but in 1594, count Philip Lewis introduced the opinions of Calvin, which have prevailed, though there are still some Lutherans and persons of the Romish church, who are permitted the free exercise of their religion. Trade and manufactures flourish here, particularly in the city of Hanau.

The ruling count of Hanau-Munzenberg was a member of the college of the imperial counts of the Wetterau; but the landgrave William VI. separated himself from them, and in 1741 also from the circle of the Upper Rhine. The income arising to the last count of Hanau from his several territories, is said to have amounted to above five hundred thousand florins.

In this county are five towns and ninety-six villages, the principal place in which is the following.

Hanau, the capital of the county, is seated in a large plain on the river Kinzig, near the place where it runs into the Maine, and is composed of the Old and New Town, both of which are fortified. The Old Town which from time immemorial has belonged to the Hanau family, is ill built; but the palace called the Burg makes a good appearance, and has a fine flower-garden. Both the Lutherans and Calvinists have their particular church, and here is an university built by count Philip Lewis. The Jews dwell in a particular quarter, and are allowed schools. To this Old Town belongs a large suburb.

The New Town is not only of greater extent, but the streets are straight, broad, and clean; most of the houses on both sides are very regularly built; and it comes very near the Dutch towns in neatness. The streets terminate in a grand square in the centre of the town, where the public markets are kept. At each of the four corners of this square is a well of tolerable depth, walled round with marble, and adorned with some foliage and iron-work, on the top of which is a large lamp, that is lighted every evening. The church in which they preach both in Flemish and French is but one edifice, divided by a wall from top to bottom into two separate apartments. The gallery in the French part is very spacious, and is an amphitheatre supported by twelve columns of red stone upon which the roof rests, and the ceiling is of stucco, very well adorned. The Catholics have no church here; but perform their devotions at a village seated about a mile from Hanau.

The New Town was built in the year 1597, by the Walloons, or Flemish refugees, who enjoy extraordinary privileges; they have their own magistrates, and the disposal of all the town offices, which the members of the French and Dutch congregations can alone possess, though at present the German Calvinists constitute one half of the inhabitants, and the Lutherans a fourth. Here are several woollen manufactures, particularly of grograms, stockings, both silk and worsted, linen and porcelain. Hanau is more particularly famous for the great quantities of roll tobacco made up here; wax-

bleaching is also carried on in this city; but the greatest article in its imports is timber, which is brought down the Maine to this city, as is also rough and cast iron, corn, and meal.

In the neighbourhood of Hanau is Philipstruhe, a beautiful seat near the village of Kesselstadt on the Maine. It was built by count Philip Reinhard; but received very great improvements from count John Reinhard, his brother and successor.

S E C T. VII.

Of the free Imperial Cities of Francfort, Friedberg, and Wetzlar.

FRANCFORT, or Frankfort on the Maine, the usual place of the election and coronation of the kings of the Romans; also the place where the states of the Rhenish circles meet, and a celebrated Hans-town, is situated in the fiftieth degree sixteen minutes north latitude, and in the seventh degree thirty-six minutes east longitude, seventeen miles to the westward of Hanau, in a delightful, healthy, and fertile country along the Maine, by which it is divided into two parts, distinguished by the names of Francfort and Saxenhausen. The former of these being the largest, is divided into twelve wards; and the latter into two, and both are reckoned to contain about three thousand houses. The fortifications, which are both regular and solid, form a decagon, or figure consisting of ten bastions, faced with hewn stone, the ditches are deep and filled with fresh water, and all the out-works are placed before the gates. There are, however, few cannon on the works. At Saxenhausen there is little worth notice, except its fortifications, which are tolerably good. There is in particular a large horn-work, a ditch full of water, and a covert-way very judiciously contrived, ranging on the head of the ditch, which must be passed in order to go to Saxenhausen on the land side. There are six bastions in all; but they are very irregular.

The town-house of Francfort is a vast building worth seeing. The hall where the emperor is chosen is not very large; but it is adorned with pictures, among which are one of Esther and Ahasuerus: the figures are clothed according to the mode about one hundred and fifty years ago; that is, with fardingales, ruffs, doublets, &c. Here is likewise the history of Susannah and the two Elders; that of Dionysius the tyrant and his favourite Damocles, with a noble repast before him, which he does not touch for fear of a sword that hangs by a slender thread directly over his head; Sesostris king of Egypt, with his chariot drawn by captive kings; Eginhard, secretary to Charlemagne, and Emma his spouse, that emperor's daughter; Scipio Africanus restoring a young captive princess inviolate to her bridegroom; and Bathsheba in the bath.

The fore part of this structure is supported by arches, under which during the fair of Francfort are toy-shops of all kinds and over these arches is a hall, where the emperor usually dines after his coronation, and into which opens the chamber where the election of the new emperor is canvassed. In the above hall the emperor eats at a table by himself, and the electors have also their separate tables. The floor is covered with black and yellow cloth, the livery of the house of Austria, and upon the ceiling is painted the story of Ganymede carried away by Jupiter's eagle; and the history of a false witness who had accused a person of murder; but when he had confirmed his evidence by an oath, a large raven, it is said, having forced his way through one of the windows of this hall, perched on the villain's head, and tore out his eyes with his beak; on which the miscreant being touched with remorse, confessed his crime, and had his head struck off.

In the back part of this structure are the city offices, and the diet chamber of the circle of the Upper Rhine, as likewise that of the dictature of the circle. Among the archives of the town-house is kept the celebrated golden bull of the emperor Charles IV. which is a parchment book of forty-three quarto leaves, containing the

fundamental institutes of the empire written in Latin with capital letters. This famous piece is, according to some authors, kept in a gold casket: but Mr. Keyser says, it is in a tortoise-shell snuff-box set with mother of pearl, and lined with yellow velvet; and that the book is very much soiled.

The cathedral of St. Bartholomew is a large building, but there are only two or three things that render it worthy of notice. The first is a small, long, and narrow chapel, which is dark and without any ornaments, except the red cloth with which it is hung near the altar in that part where the electors or their representative sit. This altar is very mean for so celebrated a place, and the seats on which the electors sit, when they choose an emperor, are benches of very common wood placed against the walls. The other thing that deserves notice is a chapel, to which the elected emperor is conducted, in order to be crowned by the elector of Mentz, and is nothing more than an iron cloister, without any ornament, joined to the balustrade of the choir, and has some resemblance to a parrot's cage. The altar in it has no other ornament than a brass crucifix of very indifferent workmanship.

The above places attract the attention of travellers on account of the important business performed in them; but the curious clock in this cathedral, which consists of three parts or divisions, is perhaps more worthy of notice. In the lowest, which resembles a calendar, are several circles, the first of which shews the day and month; the second the golden number, with the age and change of the moon; and the third the dominical letter. The fourth and fifth circles represent the ancient Roman calendar. On the sixth are the names of the apostles and martyrs, the length of the days and nights, and the entrance of the sun into the twelve signs of the zodiac. The seventh and eighth circles exhibit the hours and minutes when the sun rises and sets. In the other circles within these are the divisions of the twelve signs of the zodiac, the four seasons, the moveable feasts, &c. The figures which strike the hours represent two smiths with hammers in their hands. This curious piece of clock-work was put up in the year 1605, and repaired for the first time in 1704.

This cathedral belongs to the Catholics, though most of the inhabitants are Lutherans. It is said to have been built by Pepin, king of France, and greatly enriched by his son Charlemagne; but the emperor Lewis of Bavaria took away the greatest part of its revenues, to punish the chapter, who had sided with the pope against him.

The churches of St. Leonard and Our Lady are both collegiate. In the church of the Predicants are two altars, standing opposite to each other, which are decorated with two pieces of painting by Albert Durer. One of them represents our Saviour's Ascension, and the other the Assumption of the Virgin Mary: but the latter is only a copy, the original having fallen into the elector of Bavaria's hands. There is here also a convent, with a church of the order of St. John; together with others belonging to the Carmelites, Dominicans, Capuchins, and two Romish chapels.

The Lutheran churches and convents are the Great church; that of St. Catharine, where, in 1522, the first Lutheran sermon was preached, and to which is annexed a nunnery of ladies of noble birth; the church of the White Women, so called from the convent belonging to it instituted for ladies, and other young women of high birth; St. Peter's church; together with the chapel of the Glauburg; the hospital church; St. Nicholas's church; as also the church in Saxenhausen.

Here is likewise a seminary of divines founded by Dr. Pridius, and completed by Dr. Munden; and a Lutheran gymnasium, which consists of seven classes, and stands contiguous to the church of the Bare-footed friars, and in it is the city library. The alms, orphan, and work-house is a well contrived building under good regulations, that are strictly executed. The hospital of the Holy Ghost is one of the wealthiest foundations in the whole city.

Frankfort is of a circular form, without any suburbs; but the streets are generally narrow, and the houses are mostly built of timber and plaister, and covered with slate;

but there are some handsome private structures of a kind of red marble that justly deserve the name of palaces; as the buildings called the Compestel and Fronhof, the Trierhof, the Cullenhof, the German-house, an august edifice situated near the bridge over the Maine, the Hesse-Darmstadthof, the palace of the prince de la Tours, and the houses of the counts of Solms, Schauenberg, and Schonborn; and there are three principal squares.

The bridge which forms the communication between Frankfort and Saxenhausen is four hundred and fifty paces in length; and over a gate as you enter upon it is a Latin inscription in gold letters to the following purpose: "In the reign of Leopold I. the most august emperor of the Romans and Germany, king of Hungary and Bohemia, the true father of his country, under whose happy auspices the empire enjoys an uninterrupted prosperity, this fortified gate was repaired by the city of Frankfort." The Jews quarter consists of a very narrow street about an English mile in length, and extremely dirty. At each end of it is a gate, which is carefully shut every evening, and the keys carried to the magistrates. The houses are mostly four, five, or six stories high; but the apartments are extremely filthy. This quarter is said to contain three or four thousand persons; but, according to the Jews themselves, they amount to some thousands more. The principal commerce they carry on here is in buying and selling old goods, in going from inn to inn to sell toys to strangers, and in exchanging such money as is not current here. They are obliged, under severe penalties, to fetch water when a fire happens in any part of the city, however distant it may be from their quarter; and in return the magistracy permit them to choose twelve judges out of their own body for deciding the differences and quarrels that happen among them; but those who will not submit to their decisions, are allowed to appeal to the tribunals of the Lutherans. As to their dress, it is suitable to the filthiness of their dwellings. The men generally wear cloaks, that are extremely coarse and thread-bare, with flapped hats, old greasy ruffs, and thick pointed beards. Their women indeed are not quite so ragged and dirty as the men; they wear over their cloaths short cloaks of black crape, bound about their necks by clasps of gilt copper, and round their shoulders a border of tinsel about a foot broad, shining like gold. Their head-dress formerly resembled that of the Christian women; but the magistrates have obliged them to wear a coarse wrapper about their heads, ending at their forehead in two large horns about four fingers in breadth, one of which is covered with black gauze, and the other with a piece of lawn dyed blue. Girls are not permitted to enter the synagogue, and are distinguished from the married women by their head-dress, which is a piece of red taffety bordered with gold gauze. Many Jewesses wear earrings that represent the signs of their houses, or shops; as for instance, if a cat be the sign, the wife or girl of the house carries dangling at her ears two cats in miniature of copper gilt.

But though the Jewish worship and that of the Papists is tolerated in this city, and the latter in particular have many churches and convents; neither the French nor German Calvinists are permitted to have one place of religious worship within the walls, and are obliged to go every Sunday to Bockenheim, which lies about a league from the city in the territory of Hanau. The wealthy persons among them have frequently offered a large sum to the magistracy, for leave to assemble for public worship in Frankfort, were it in ever so mean a place; yet such is their unchristian partiality against their brother reformers, and such enemies are they to religious liberty, that this privilege has been obstinately refused them. However, Mr. Busching says, that it is thought they will at last be permitted to build a church just without the town. The number of coaches which generally go to the two churches at Bockenheim every Sunday amount to about two hundred and fifty, many wealthy persons in Frankfort being of the reformed church; and it is there a common saying, "That the Roman catholics have the churches, the Lutherans the magistracy, and the Calvinists the money."

Among

Among the natural curiosities at Francfort, that of the hazel-tree, mentioned by Mr. Keyser, is highly worthy of notice: it is to be seen in Mr. Hassel's garden in the city, and is mentioned in the Francfort Chronicles above two hundred years ago. "The lower part of its trunk," says that gentleman, is seven Francfort ells in circumference, that is, fifteen feet nine inches: its height is equal to that of the houses near it, and it still bears nuts every year. The shells of the nuts it produces are very thick; but the kernel has the same flavour as those of other nuts. The emperor Leopold dined twice under this tree. The soil of this garden, he adds, must be particularly favourable to hazel-trees; for though the adjacent ground yields only common shrubs, four hazel-trees planted within these fifteen years in Mr. Hassel's garden, are already above twenty feet high. These recruits are the more necessary, as the above-mentioned old tree begins to decay."

The fairs held at Francfort are famous all over Europe; and Mr. Keyser observes, that some merchants, who are competent judges, assured him, that ten millions of dollars would hardly purchase the merchandize exposed to sale at one of these fairs, the goods in the ware-houses and shops included. Of the manufactures carried on here, those of silk and porcelain are the most considerable.

This has always been an imperial city. In the diet it holds the sixth place among the imperial cities of the Rhine, and also votes in the diet of the Upper Rhine.

The magistracy here consists of a judge, the bench of schoffen or aldermen; the second bench of the council; together with the third, which is composed of artificers and tradesmen. The last is also summoned in affairs of general concern, and executes the offices relating to the police; but the direction of important affairs is lodged in the two former, out of whom the two burgomasters are annually chosen. Law-suits are here determined by the schoffens and syndics. The members of the consistory are two schoffen, the *senior ministerii*, the two eldest pastors, and two civilians. The territory belonging to the city contains a number of villages, seats, and farms; and the sides of the Maine are adorned with a vast number of gardens and vineyards, in which some of the vines are propped up by stakes, and others supported in the form of arbours; but the wines they produce are not very strong.

We shall now take notice of the imperial cities of Friedberg and Wetzlar.

The imperial city of Friedberg stands near the Ufbach, on a very fertile spot on the ridge of hills called the Hohe, and was formerly much larger than it is at present. This city enjoys the twelfth seat on the bench of the imperial towns of the Rhine. The magistracy, with the greatest part of the burghers, are Lutherans. It is governed by a burgrave and six nobles, who are members of the general council, and of that of the states; and when any affairs relating to the empire and circle come on the carpet, notice is given them of it by the magistracy, that they may jointly agree on the person to be deputed, and on the nature and extent of his powers.

The imperial town of Wetzlar is seated on the Lahn, near its confluence with the Wetzbach, and on the other side the Dill. The magistrates and most of the burgherans are Lutherans. Besides the cathedral, which the Protestants hold in common with the Catholics, they have a chapel, and a grammar-school in a building that was originally a Franciscan convent, and the church of the hospital of the Holy Ghost. The Catholics have not only the use of the cathedral, but a Franciscan convent, with a church, and a Jesuits college. The Calvinists have likewise a church here. In the town-house are held the meetings of the imperial-chamber, which in the year 1693 was removed hither from Spire.

Wetzlar was an imperial city so early as the days of the emperor Frederic I. and has the thirteenth bench of the imperial cities of the Rhine, and also a vote in the diets of the Upper Rhine.

S E C T. VIII.

Of the Dutchy of Deuxponts, and the Principality of Nassau. An Account of the Family of Nassau, and the Titles, Arms, and principal Places belonging to each of those Princes.

THE dutchy of Deuxponts, which is situated in the most southern part of the circle, is in general a mountainous barren country; yet is interspersed with some fertile valleys. It extends in its greatest length about forty miles, and from eight to twenty-five in breadth. It belongs to the duke of Deuxponts, whose annual revenue arising from this dutchy is computed at three hundred thousand florins.

Deuxponts, the capital of this dutchy, is called by the Germans Zweybrucken, and in Latin Bipontium, all which signify Two Bridges, a name which it received from its two bridges over the rivulets of Blise and Swolb, on which it stands; and this name it gave to the whole dutchy. It is situated in the forty-ninth degree thirty minutes north latitude, and in the fourth degree thirty-one minutes east longitude. It is a small, but neat well-built town, and has a fine palace erected in the modern taste. Of the great church here, the Calvinists have the nave, and the Catholics the choir. The Lutherans have likewise a church, and in this town is also a gymnasium. During the thirty years war it suffered extremely, as it also did in 1677, when it was taken by the French.

In a vale at a small distance is Schuslic, a pleasure-house erected by Stanislaus, the dethroned king of Poland, during his residence at Deuxponts; but it is now gone to ruin.

The principality of Nassau, which we shall next describe, is bounded on the north by Westphalia, on the east by Solms, on the south by the bishopric of Mentz, and on the west by the electorate of Treves. The length of the whole principality is computed at fifty-seven miles, and its breadth at thirty-two.

Though it is for the most part mountainous and woody, it is not without fine arable and meadow land.

The founder of the present princes of Nassau was count Henry I. surnamed the Wealthy, who, in the thirteenth century, left to his two sons, Walram and Otho I. the county of Nassau, with its feudal, patrimonial, and hereditary lands.

With respect to the first line, William Henry, prince of Nassau-Usingen, left two sons, who were the founders of the two present ruling lines; namely, prince Charles, of the Nassau-Saarbruck-Usingen line, and prince William Henry, of that of Nassau-Saarbruck, who, on the twenty-third of September, 1735, agreed to a partition, by which the last gave to the former all the inherited and escheated land on this side the Rhine, and the former gave to the latter those lying on the other side of that river.

The only remaining line of the descendants of Otho is that of Nassau-Dillenburg-Dietz, which subsists in the prince of Orange, hereditary stadtholder of the United Provinces.

The titles of the prince of the elder line descended from Walram are, Prince of Nassau, count of Saarbruck and Saarwerden, and lord of Lahr-Wisbaden and Idstein.

His arms for Nassau are a lion, in a field azure, semée of billets or: for the county of Saarbruck, azure, a lion argent semée of crosslets argent: for the county of Saarwerden, sable, a spread-eagle argent: for Mors, or, a fesse sable: for Weilnau, or, two leopards passant gules: for Mehreinberg, verte, a saltier cross or, semée with crosslets or: for Mahlberg, or, a lion sable: for Lahr, or, on a fesse gules.

The titles of William V. prince of Orange, and stadtholder of the United Provinces, with respect to the territories of Nassau are: Prince of Nassau, count of Katzenelnbogen, Vianen, and Dietz, and lord of Beilstein. His arms for Nassau are, azure, a lion or, semée of billets or; for Katzenelnbogen, or, a lion rampant gules; for

Q q q

Vianen,

Vianen, or, a fesse argent; for Dietz, gules, two lions passant or.

The princes of the antient line of Walram have no seat or voice in the college of princes; but have five votes at the diet of the circle of the Upper Rhine. The princes of the younger branch acquired a seat and vote in the college of princes in 1659, and have two other votes, both which are inherent in the stadtholder of the United Netherlands, who has also two votes in the diet of Westphalia.

The county of Nassau-Dietz lies on the river Lahn, and was formerly called the Golden Country, on account of its fertility, and consists of nine prefectures, the principal places in which are the following:

Dietz, the capital of a prefecture of the same name, is seated on the Lahn, over which it has a bridge of stone, and is divided into the Old and New Town. The prince has a palace here which stands on a hill. The Calvinists have two churches here, and the Lutherans one. At a small distance from the town is Oranienstein, a seat belonging to the prince seated on the Lahn.

Weilburg, a handsome town which stands on an eminence by the river Lahn, over which it has a bridge of stone. The prince's palace here contains some very elegant apartments, with a fine garden belonging to it, and a magnificent chapel. All the roads near the town form beautiful vistas, they being laid out in a direct line, and each planted on both sides with a row of trees. In the neighbourhood is a large menagerie, with a pleasure-house.

In the country belonging to Nassau-Saarbruck-Ufingen is Wisbaden, a handsome, populous, and thriving town, seated in the lordship of the same name, and in a good wine country. The prince's palace in this place was built in the beginning of the present century. The warm baths here were known to the antient Romans, and are still famous. This town suffered greatly in the wars of the seventeenth century; but has been since considerably improved by prince George Augustus.

The prince of Nassau-Ufingen has a beautiful seat in the village of Biberich, which is situated on the Rhine: it was erected by prince George Augustus, and embellished by prince Charles: the building is large and magnificent, and stands in a delightful situation.

The lands belonging to Nassau-Saarbruck, are situated between Lorrain, which lies to the west, and Deux-ponts to the east; but though it is for the most part sandy and woody, it abounds in iron and pit-coal, and the soil in some places produces good corn.

Saarbruck, the capital of this little district, lies on the river Saar. It was set on fire, and its walls destroyed by the Imperialists, on their recovering it from the French in 1676; but was again rebuilt, and at present consists of about two hundred houses, with a Lutheran and Calvinist church. The prince's palace in this place was erected by prince William Henry. Opposite to this town on the other side of the river is St. Johann, with which it has a communication by means of a bridge. It is equal to Saarbruck in extent, and is defended by a rampart and moat. The Catholics are in the possession of the old church, and since the year 1727, a new one has been erected for the Lutherans.

SECT. IX.

Of the Principality of Hersfeld, the Counties of Solms, Upper Isenburg, and Witgenstein; the Lordship of Westburg, and the other small States in the Circle of the Upper Rhine.

BESIDES the countries already described in the circle of the Upper Rhine, there are a considerable number of others, most of which are very small and inconsiderable, and are only remarkable for having a seat and voice in the college of princes, and in the diets of this circle.

One of the chief of these is the principality of Hersfeld, or Hirschfeld, which borders on Upper and Lower Hesse, and is about twelve miles long, and the same in breadth. It is subject to the house of Hesse Cassel, who

on that account have an additional vote in the college of princes, and at the diet of the circle of the Upper Rhine.

Hersfeld, its capital, is seated on the Fulda, forty miles to the south of Cassel, and is a neat but small city, in which is a palace, a cathedral, a town church, a seminary, and a wealthy hospital.

The county of Solms is chiefly situated on both sides the Lahn, and borders on the territories of Hesse and Nassau, and the district of the city of Wetzlar. It abounds in corn and cattle, and has many iron mines, which employ several founderies and other works.

The counts of Solms, which are supposed to be a branch of the family of Nassau, are divided into the two principal branches, that of Solms-Braunsfels, and that of Solms-Lich, each of whom has the following title, Lord of Munzenberg, Wildenfels, Sonnenwald, &c. and their arms are, for Solms, or, a lion azure; for Munzenberg, party per fesse or and gules; for Wildenfels, sable, a lion argent.

The counts of Solms have four votes in the college of the imperial counts of Wetteravia, and a like number in the diet of the circle of the Upper Rhine.

The principal place in the whole county is Braunsfels, which is seated on a hill, where is a handsome castle or palace belonging to the prince, fortified after the antient manner, and is a place of great strength. It contains within it a church that also serves the inhabitants of the town, which stands on the outside. Both the castle and town are supplied with water by works erected at the foot of the hill. In the seventh century this town was twice destroyed by fire.

Upper Isenburg is thus called to distinguish it from the county of Lower Isenburg, in the Palatinate, and properly consists of the lordship of Bidingen. It is a fine corn-country, that has also some considerable woods, pastures, and vineyards; and is watered by several little streams, as the Kinzig, the Semen, and the Nidder.

The four princes of the house of Isenburg govern different parts of this country, and sit in the college of the imperial counts of Wetteravia, and in the diets of the circle of the Upper Rhine.

The principal places in this county are the two following:

Offenbach on the Maine, a small town, which contains a palace, a German Calvinist, a French Calvinist, and a Lutheran church; and has several flourishing manufactures.

Bidingen, though a small town, is the capital of the whole country. The palace here has a fine parterre, contiguous to which is an orphan-house, in which a woollen manufacture is carried on. Here is also a free-school.

The county of Witgenstein is nineteen miles in length, and its greatest breadth is somewhat above thirteen. It borders on Hesse-Darmstadt, the principality of Nassau-Dillenburg, and the dutchy of Westphalia. Some parts of it are very mountainous, but yield plenty of wood, with mines of silver, copper, and iron. It has good pastures; but produces little grain, except oats.

This county is divided between the two houses of Sayn-Witgenstein of Witgenstein, and Sayn-Witgenstein of Berleburg. Each house has a distinct vote both in the college of the counts of the empire, the diet of the Upper Rhine, and the college of Wetteravia. The joint revenue of these counts is computed at fifty thousand rix-dollars a year.

The principal places in this county belonging to each of the counts are the following:

Witgenstein, seated on a high mountain, and the patrimonial-house of the antient counts of Witgenstein, and where those of Sayn-Witgenstein still reside.

Berleburg, a small town seated on the little river Berlen, near the place where it falls into the Eder. In this town is a fine palace, and two other houses belonging to the count.
